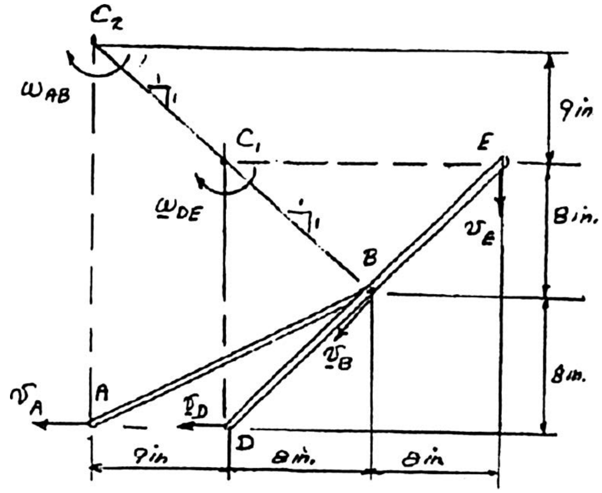
PROBLEM 15.98

Two rods *AB* and *DE* are connected as shown. Knowing that Point *D* moves to the left with a velocity of 40 in./s, determine (*a*) the angular velocity of each rod, (*b*) the velocity of Point *A*.

SOLUTION



We locate two instantaneous centers at intersections of lines drawn as follows:

C_1: For rod *DE*, draw lines perpendicular to $\mathbf{v}_D$ and $\mathbf{v}_E$.

C_2: For rod *AB*, draw lines perpendicular to $\mathbf{v}_A$ and $\mathbf{v}_B$.

Geometry:

$$BC_1 = (8\text{ in.})\sqrt{2} = 8\sqrt{2}\text{ in.}$$
$$DC_1 = 16\text{ in.}$$
$$BC_2 = (9\text{ in.} + 8\text{ in.})\sqrt{2} = 17\sqrt{2}\text{ in.}$$
$$AC_2 = 25\text{ in.}$$

(*a*) Rod *DE*:

$$v_D = (DC_1)\omega_{DE}$$
$$40\text{ in./s} = (16\text{ in.})\omega_{DE}$$
$$\omega_{DE} = 2.5\text{ rad/s}$$

$$\boldsymbol{\omega}_{DE} = 2.5\text{ rad/s} \circlearrowright \blacktriangleleft$$

$$v_B = (BC)\omega_{DE}$$
$$= (8\sqrt{2}\text{ in.})(2.5\text{ rad/s})$$
$$\mathbf{v}_B = 20\sqrt{2}\text{ in./s} \measuredangle 45°$$

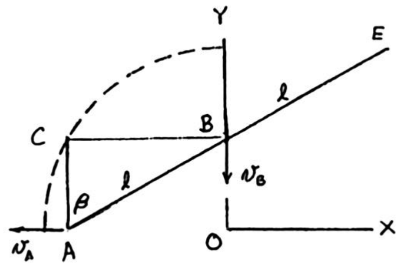
PROBLEM 15.99

Describe the space centrode and the body centrode of rod *ABD* of Problem 15.83. (*Hint:* The body centrode need not lie on a physical portion of the rod.)

PROBLEM 15.83 Rod *ABD* is guided by wheels at *A* and *B* that roll in horizontal and vertical tracks. Knowing that at the instant shown $\beta = 60°$ and the velocity of wheel *B* is 40 in./s downward, determine (*a*) the angular velocity of the rod, (*b*) the velocity of Point *D*.

SOLUTION



Draw *x* and *y* axes as shown with origin at the intersection of the two slots. These axes are fixed in space.

$$\mathbf{v}_A = v_A \longleftarrow, \qquad \mathbf{v}_B = v_B \downarrow$$

Locate the space centrode (Point *C*) by noting that velocity directions at Points *A* and *B* are known. Draw *AC* perpendicular to $\mathbf{v}_A$ and *BC* perpendicular to $\mathbf{v}_B$.

The coordinates of Point *C* are $x_C = -l\sin\beta$ and $y_C = l\cos\beta$

$$x_C^2 + y_C^2 = l^2 = (15\text{ in.})^2$$

The *space centrode* is a quarter circle of 15 in. radius centered at *O*. ◀

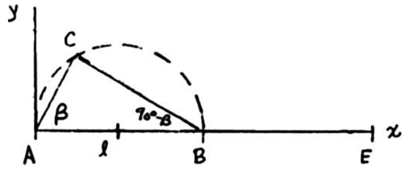
Redraw the figure, but use axes *x* and *y* that move with the body. Place origin at *A*.

$$x_C = (AC)\cos\beta$$

$$= l\cos^2\beta = \frac{l}{2}(1+\cos 2\beta)$$

$$y_C = (AC)\sin\beta$$

$$= l\cos\beta\sin\beta = \frac{l}{2}\sin 2\beta$$



$$\left(x_C - \frac{l}{2}\right)^2 + y_C^2 = \left(\frac{l}{2}\right)^2 = (x_C - 7.5)^2 + y_C^2 = 7.5^2$$

The *body centrode* is a semicircle of 7.5 in. radius centered midway between *A* and *B*. ◀

If you are a student using this Manual, you are using it without permission.*

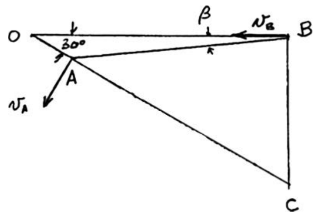
PROBLEM 15.101

Using the method of Section 15.7, solve Problem 15.60.

PROBLEM 15.60 In the eccentric shown, a disk of 2-in.-radius revolves about shaft O that is located 0.5 in. from the center A of the disk. The distance between the center A of the disk and the pin at B is 8 in. Knowing that the angular velocity of the disk is 900 rpm clockwise, determine the velocity of the block when $\theta = 30°$.

SOLUTION



$$(OA) = 0.5 \text{ in.} \quad \omega_{OA} = 900 \text{ rpm} = 30\pi \text{ rad/s} \circlearrowright$$

$$\mathbf{v}_A = (OA)\omega_{OA} = (0.5)(30\pi) = 15\pi \text{ in./s}$$

$$\mathbf{v}_A = v_A \measuredangle 60°, \qquad \mathbf{v}_B = v_A \longleftarrow$$

Locate the instantaneous center (Point C) of bar BD by noting that velocity directions at Point B and A are known. Draw BC perpendicular to $\mathbf{v}_B$ and AC perpendicular to $\mathbf{v}_A$.

$$\sin\beta = \frac{(OA)\sin 30°}{AB} = \frac{0.5\sin 30°}{8}, \quad \beta = 1.79°$$

$$OB = (OA)\cos 30° + (AB)\cos\beta = 0.5\cos 30° + 8\cos\beta$$
$$= 8.4291 \text{ in.}$$

$$AC = \frac{OB}{\cos 30°} - OA = \frac{8.4291}{\cos 30°} - 0.5 = 9.2331 \text{ in.}$$

$$BC = (OB)\tan 30° = 4.8665 \text{ in.}$$

$$\omega_{AB} = \frac{v_A}{AC} = \frac{v_B}{BC}$$

$$v_B = \left(\frac{BC}{AC}\right)v_A = \frac{(4.8665)(15\pi)}{9.2331} = 24.84 \text{ in./s} \qquad \mathbf{v}_B = 24.8 \text{ in./s} \longleftarrow \blacktriangleleft$$

PROBLEM 15.102

Using the method of Section 15.7, solve Problem 15.64.

PROBLEM 15.64 In the position shown, bar *AB* has an angular velocity of 4 rad/s clockwise. Determine the angular velocity of bars *BD* and *DE*.

SOLUTION

Bar *AB*: (Rotation about *A*) $\boldsymbol{\omega}_{AB} = 4 \text{ rad/s} \circlearrowright$

$$\overline{AB} = 175 \text{ mm} \qquad v_B = \omega_{AB}(\overline{AB}) = (4)(175)$$

$$\mathbf{v}_B = 700 \text{ mm/s} \uparrow$$

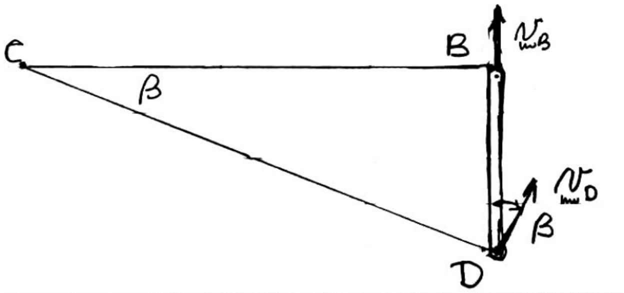
Bar *DE*: (Rotation about *E*) $\boldsymbol{\omega}_{DE} = \omega_{DE} \circlearrowright$

$$\overline{DE} = \sqrt{(275)^2 + (75)^2} = 285.04 \text{ mm}$$

$$\mathbf{v}_D = 285.04\omega_{DE} \measuredangle \beta$$

$$\tan\beta = \frac{75 \text{ mm}}{275 \text{ mm}} = 0.27273$$

Bar *BD*: $\mathbf{v}_B = 700 \text{ mm/s} \uparrow, \qquad \mathbf{v}_D = 285.04\omega_{DE} \measuredangle \beta$



Locate the instantaneous center of bar *BD* by drawing line *BC* perpendicular to $\mathbf{v}_B$ and line *DC* perpendicular to $\mathbf{v}_D$.

$$\overline{BD} = 200 \text{ mm}$$

$$\overline{CB} = \frac{\overline{BD}}{\tan\beta} = \frac{(200)(275)}{75} = 733.3 \text{ mm}$$

$$\overline{CD} = \frac{\overline{BD}}{\sin\beta} = \frac{(200)(285.04)}{75} = 760.11 \text{ mm}$$

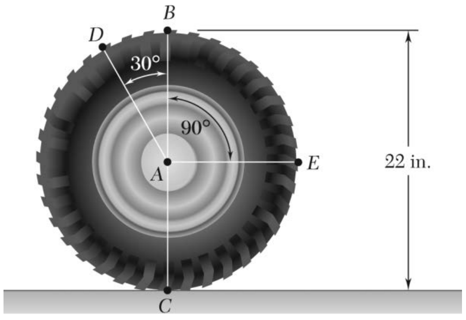
PROBLEM 15.104



Using the method of section 15.7, solve Problem 15.38.

PROBLEM 15.38 An automobile travels to the right at a constant speed of 48 mi/h. If the diameter of a wheel is 22 in., determine the velocities of Points *B*, *C*, *D*, and *E* on the rim of the wheel.

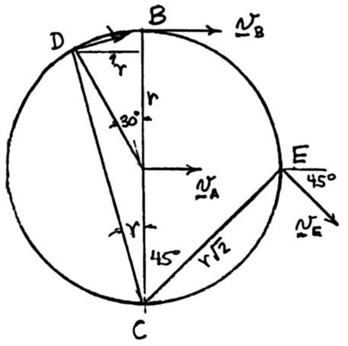
SOLUTION

$$v_A = 48 \text{ mi/h} = 70.4 \text{ ft/s}$$

$$\mathbf{v}_C = 0 \blacktriangleleft$$

$$d = 22 \text{ in.,} \quad r = \frac{1}{2}d = 11 \text{ in.} = 0.91667 \text{ ft}$$

Point *C* is the instantaneous center.



$$\omega = \frac{v_A}{r} = \frac{70.4}{9.1667} = 76.8 \text{ rad/s}$$

$$CB = 2r = 1.8333 \text{ ft}$$

$$v_B = (CB)\omega = (1.8333)(76.8) = 140.8 \text{ ft/s}$$

$$\mathbf{v}_B = 140.8 \text{ ft/s} \longrightarrow \blacktriangleleft$$

$$\gamma = \frac{1}{2}(30°) = 15°$$

$$CD = 2r\cos 15° = (2)(0.91667)\cos 15° = 1.7709 \text{ ft}$$

$$v_D = (CD)\omega = (1.7709)(76.8) = 136.0 \text{ ft/s}$$

$$\mathbf{v}_D = 136.0 \text{ ft/s} \measuredangle 15.0° \blacktriangleleft$$

$$CE = r\sqrt{2} = 0.91667\sqrt{2} = 1.2964 \text{ ft}$$

$$v_E = (CE)\omega = (1.2964)(76.8) = 99.56 \text{ ft/s}$$

$$\mathbf{v}_E = 99.6 \text{ ft/s} \searrow 45.0° \blacktriangleleft$$

PROBLEM 15.CQ7

A rear wheel drive car starts from rest and accelerates to the left so that the tires do not slip on the road. What is the direction of the acceleration of the point on the tire in contact with the road, that is, Point *A*?

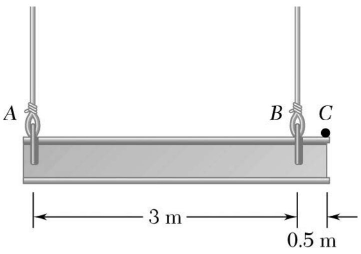
(*a*) ← (*b*) ↖ (*c*) ↑ (*d*) ↓ (*e*) ↙

SOLUTION

The tangential acceleration will be zero since the tires do not slip, but there will be an acceleration component perpendicular to the ground.

Answer: (*c*) ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



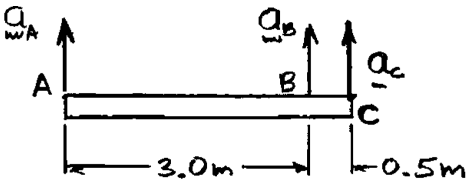
PROBLEM 15.105

A 3.5-m steel beam is lowered by means of two cables unwinding at the same speed from overhead cranes. As the beam approaches the ground, the crane operators apply brakes to slow down the unwinding motion. At the instant considered, the deceleration of the cable attached at *A* is 4 m/s², while that of the cable at *B* is 1.5 m/s². Determine (*a*) the angular acceleration of the beam, (*b*) the acceleration of Point *C*.

SOLUTION

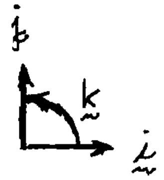
$$\mathbf{a}_A = 4 \text{ m/s}\uparrow$$

$$\mathbf{a}_B = 1.5 \text{ m/s}\uparrow$$



Assume $\omega = 0$.

(*a*) Angular acceleration. $\boldsymbol{\alpha} = \alpha\mathbf{k}$



$$\mathbf{a}_B = \mathbf{a}_A + \mathbf{a}_{B/A}$$

$$1.5\mathbf{j} = 4\mathbf{j} + \alpha\mathbf{k}\times(3\mathbf{i}) = 4\mathbf{j} + 3\alpha\mathbf{j}$$

$$\alpha = \frac{1.5-4}{3} = -0.83333$$

$$\boldsymbol{\alpha} = -0.833\mathbf{k} \qquad \boldsymbol{\alpha} = 0.833 \text{ rad/s}^2 \circlearrowright$$

(*b*) Acceleration of Point *C*. Because the cables are unwinding at the same speed, $\omega = 0$

$$\mathbf{a}_C = \mathbf{a}_A + \mathbf{a}_{C/A} = \mathbf{a}_A + \boldsymbol{\alpha}\times\mathbf{r}_{C/A}$$

$$= 4\mathbf{j} + (-0.83333\mathbf{k}\times 3.5\mathbf{i})$$

$$= 4\mathbf{j} - 2.9167\mathbf{j} = 1.0833\mathbf{j}$$

$$\mathbf{a}_C = 1.083 \text{ m/s}^2\uparrow \blacktriangleleft$$

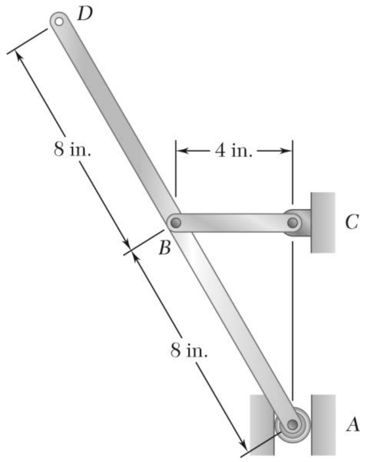
PROBLEM 15.109



Knowing that at the instant shown crank BC has a constant angular velocity of 45 rpm clockwise, determine the acceleration (*a*) of Point A, (*b*) of Point D.

SOLUTION

Geometry. Let β be angle BAC.

$$\sin\beta = \frac{4 \text{ in.}}{8 \text{ in.}} \quad \beta = 30°$$

Velocity analysis. $\boldsymbol{\omega}_{BC} = 45 \text{ rpm} \circlearrowright = 4.7124 \text{ rad/s} \circlearrowright \quad \mathbf{v}_A = v_A \uparrow$

$$v_B = (BC)\omega_{BC} = (4)(4.7124) = 18.8496 \text{ in./s} \qquad \mathbf{v}_B = 18.8496 \text{ in./s} \uparrow$$

$\mathbf{v}_A$ and $\mathbf{v}_B$ are parallel; hence, the instantaneous center of rotation of rod AD lies at infinity.

$$\boldsymbol{\omega}_{AD} = 0 \quad \mathbf{v}_A = \mathbf{v}_B = 18.8496 \text{ in./s} \uparrow$$

Acceleration analysis. $\alpha_{BC} = 0$

Crank BC: $(a_B)_t = (BC)\alpha = 0$

$$(a_B)_n = (BC)\omega_{BC}^2 = (4)(4.7124)^2$$

$$\mathbf{a}_B = 88.827 \text{ in./s}^2 \longrightarrow$$

Rod ABD: $\boldsymbol{\alpha}_{AD} = \alpha_{AD} \circlearrowleft \quad \mathbf{a}_A = a_A \uparrow$

$$\mathbf{a}_A = \mathbf{a}_B + (\mathbf{a}_{A/B})_t + (\mathbf{a}_{A/B})_A$$

$$[a_A \uparrow] = [88.827 \longrightarrow] + [8\alpha_{AD} \measuredangle 30°] + [8\omega_{AD}^2 \searrow 60°]$$

Resolve into components.

$$\xrightarrow{+}: \quad 0 = 88.827 + 8\alpha_{AD}\cos 30° + 0 \qquad \alpha_{AD} = -12.821 \text{ rad/s}^2$$

(*a*) $+\uparrow: \quad a_A = 8\alpha_{AD}\sin 30° = (8)(-12.821)\sin 30° = -51.284 \text{ in./s}^2$

$$\mathbf{a}_A = 51.3 \text{ in./s}^2 \downarrow \blacktriangleleft$$

PROBLEM 15.110

End A of rod AB moves to the right with a constant velocity of 6 ft/s. For the position shown, determine (*a*) the angular acceleration of rod AB, (*b*) the acceleration of the midpoint G of rod AB.

SOLUTION

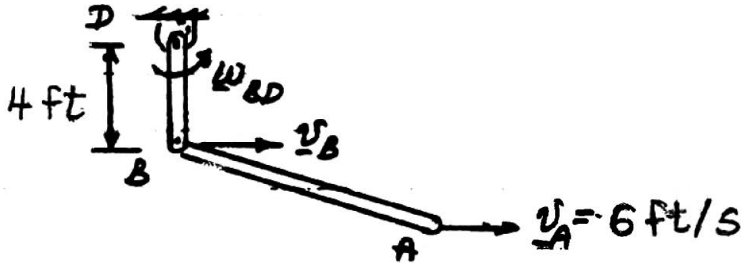
Use units of ft and seconds.

Geometry and unit vectors: $\mathbf{i} = 1 \longrightarrow, \quad \mathbf{j} = 1 \uparrow, \quad \mathbf{k} = 1 \circlearrowleft$

$$\mathbf{r}_{B/A} = -(10\cos 30°)\mathbf{i} + (10\sin 30°)\mathbf{j} \qquad \mathbf{r}_{B/D} = -4\mathbf{j}$$

Velocity analysis.

Rod AB: $\mathbf{v}_A = 6 \text{ ft/s} \longrightarrow, \quad \mathbf{v}_B = v_B \longrightarrow$



Since $\mathbf{v}_A$ and $\mathbf{v}_B$ are parallel, the instantaneous center lies at infinity, so $\omega_{AB} = 0$ and $\mathbf{v}_B = \mathbf{v}_A$.

Acceleration analysis.

Rod AB: $\mathbf{a}_A = 0$ since $\mathbf{v}_A$ is constant. $\quad \boldsymbol{\alpha}_{AB} = \alpha_{AB} \circlearrowleft = \alpha_{AB}\mathbf{k}$

$$\mathbf{a}_B = \mathbf{a}_A + \mathbf{a}_{B/A} = \mathbf{a}_A + \mathbf{a}_{AB} \times \mathbf{r}_{B/A} - \omega_{AB}^2 \mathbf{r}_{B/A}$$
$$= 0 + \alpha_{AB}\mathbf{k} \times (-10\cos 30°\mathbf{i} + 5\mathbf{j}) - 0$$
$$\mathbf{a}_B = -(10\cos 30°)\alpha_{AB}\mathbf{j} - 5\alpha_{AB}\mathbf{j} \qquad (1)$$

Rod BD: $\mathbf{a}_D = 0, \quad \boldsymbol{\alpha}_{BD} = \alpha_{BD}\mathbf{k}$

$$\mathbf{a}_B = \mathbf{a}_D + \mathbf{a}_{B/D} = 0 + \boldsymbol{\alpha}_{BD} \times \mathbf{r}_{B/D} - \omega_{BD}^2 \mathbf{r}_{B/D}$$
$$= \alpha_{BD}\mathbf{k} \times (-4\mathbf{j}) - (1.5)^2(-4\mathbf{j})$$
$$= 4\alpha_{BD}\mathbf{i} + 9\mathbf{j} \qquad (2)$$

Equating the coefficients of $\mathbf{j}$ in the expressions (1) and (2) for $\mathbf{a}_B$.

$$-(10\cos 30°)\alpha_{AB} = 9 \qquad \alpha_{AB} = -1.0392$$

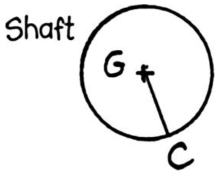
PROBLEM 15.112

The 18-in.-radius flywheel is rigidly attached to a 1.5-in.-radius shaft that can roll along parallel rails. Knowing that at the instant shown the center of the shaft has a velocity of 1.2 in./s and an acceleration of 0.5 in./s^2, both directed down to the left, determine the acceleration (*a*) of Point *A*, (*b*) of Point *B*.

SOLUTION

Velocity analysis.

Let Point *G* be the center of the shaft and Point *C* be the point of contact with the rails. Point *C* is the instantaneous center of the wheel and shaft since that point does not slip on the rails.



$$\mathbf{v}_G = r\omega, \quad \omega = \frac{v_G}{r} = \frac{1.2}{1.5} = 0.8 \text{ rad/s} \circlearrowleft$$

Acceleration analysis.

Since the shaft does not slip on the rails,

$$\mathbf{a}_C = a_C \nwarrow 20°$$

Also,

$$\mathbf{a}_G = [0.5 \text{ in./s}^2 \swarrow 20°]$$

$$\mathbf{a}_C = \mathbf{a}_G + (\mathbf{a}_{C/G})_t + (\mathbf{a}_{C/G})_n$$

$$[a_C \nwarrow 20°] = [0.5 \text{ in./s}^2 \swarrow 20°] + [1.5\alpha \nearrow 20°] + [1.5\omega^2 \nwarrow 20°]$$

Components $\swarrow$ 20°: $\quad 0.5 = -1.5\alpha \qquad \alpha = 0.33333 \text{ rad/s}^2 \circlearrowleft$

(*a*) *Acceleration of Point A.*

$$\mathbf{a}_A = \mathbf{a}_G + (\mathbf{a}_{A/G})_t + (\mathbf{a}_{A/G})_n$$

$$= [0.5 \swarrow 20°] + [18\alpha \leftarrow] + [18\omega^2 \downarrow]$$

$$= [0.4698 \leftarrow] + [0.1710 \downarrow] + [6 \leftarrow] + [11.52 \downarrow]$$

$$= [6.4698 \leftarrow] + [11.670 \downarrow] \qquad \mathbf{a}_A = 13.35 \text{ in./s}^2 \swarrow 61.0° \blacktriangleleft$$

(*b*) *Acceleration of Point B.*

$$\mathbf{a}_B = \mathbf{a}_G + (\mathbf{a}_{B/G})_t + (\mathbf{a}_{B/G})_n$$

$$= [0.5 \swarrow 20°] + [18\alpha \rightarrow] + [18\omega^2 \uparrow]$$

$$= [0.4698 \leftarrow] + [0.1710 \downarrow] + [6 \rightarrow] + [11.52 \uparrow]$$

$$= [5.5302 \rightarrow] + [11.349 \uparrow] \qquad \mathbf{a}_B = 12.62 \text{ in./s}^2 \nearrow 64.0° \blacktriangleleft$$

PROBLEM 15.117

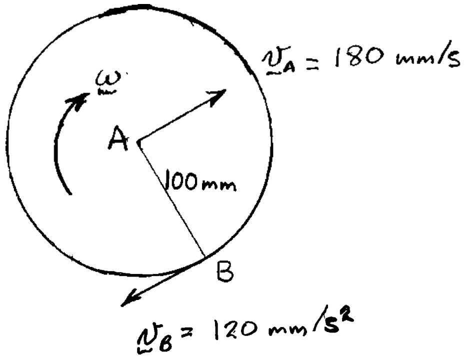
The 100 mm radius drum rolls without slipping on a portion of a belt which moves downward to the left with a constant velocity of 120 mm/s. Knowing that at a given instant the velocity and acceleration of the center A of the drum are as shown, determine the acceleration of Point D.

SOLUTION

Velocity analysis.

$$\mathbf{v}_A = \mathbf{v}_B + \mathbf{v}_{A/B}$$

$$[180 \text{ mm/s} \nearrow] = [120 \text{ mm/s} \swarrow] + [(100 \text{ mm})\omega \nearrow]$$



Components $\nearrow$:

$$180 = -120 = 100\omega$$

$$\omega = 3 \text{ rad/s} \circlearrowright$$

Acceleration analysis.

Point A moves on a path parallel to the belt. The path is assumed to be straight.

$$\mathbf{a}_A = 720 \text{ mm/s}^2 \swarrow 30°$$

Since the drum rolls without slipping on the belt, the component of acceleration of Point B on the drum parallel to the belt is the same as the belt acceleration. Since the belt moves at constant velocity, this component of acceleration is zero. Thus

$$\mathbf{a}_B = a_B \searrow 60°$$

Let the angular acceleration of the drum be $\alpha \circlearrowright$.

$$\mathbf{a}_B = \mathbf{a}_A + (\mathbf{a}_{B/A})_t + (\mathbf{a}_{B/A})_n$$

$$[a_B \nwarrow] = [720 \swarrow] + [r\alpha \nearrow] + [r\omega^2 \nwarrow]$$

Components $\swarrow$: $\quad 0 = 720 - 100\alpha$

$$\alpha = 7.2 \text{ rad/s} \circlearrowright$$

If you are a student using this Manual, you are using it without permission.*

Acceleration of Point D.

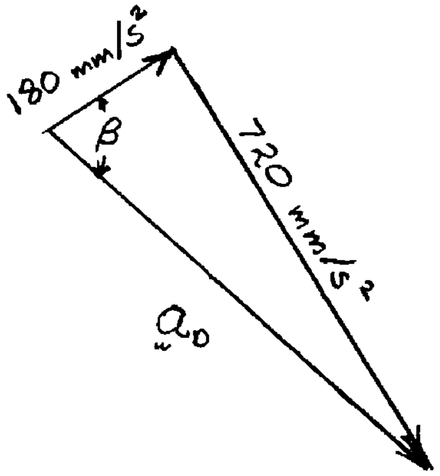
$$\mathbf{a}_D = \mathbf{a}_A + (\mathbf{a}_{D/A})_t + (\mathbf{a}_{D/A})_n$$

$$= [a_A \swarrow 30°] + [r\alpha \searrow 60°] + [r\omega^2 \measuredangle 30°]$$

$$= [720 \swarrow 30°] + [(100)(7.2) \searrow 60°] + [(100)(3)^2 \measuredangle 30°]$$

Components: $\measuredangle$ 30°: $-720 + 900 = 180 \text{ mm/s}^2$

Components: $\searrow$ 60°: 720 mm/s^2



$$a_D = \sqrt{180^2 + 720^2} = 742.16 \text{ mm/s}^2$$

$$\tan\beta = \frac{720}{180} \qquad \beta = 76.0°$$

$$\beta - 30° = 46.0°$$

$$\mathbf{a}_D = 742 \text{ mm/s}^2 \searrow 46.0° \blacktriangleleft$$

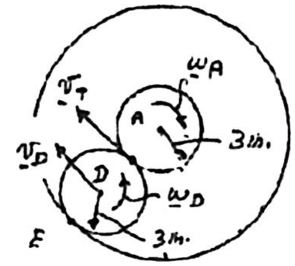
PROBLEM 15.118

In the planetary gear system shown the radius of gears *A*, *B*, *C*, and *D* is 3 in. and the radius of the outer gear *E* is 9 in. Knowing that gear *A* has a constant angular velocity of 150 rpm clockwise and that the outer gear *E* is stationary, determine the magnitude of the acceleration of the tooth of gear *D* that is in contact with (*a*) gear *A*, (*b*) gear *E*.

SOLUTION

Velocity. $T =$ Tooth of gear *D* in contact with gear *A*

Gears: $v_T = r\omega_A = (3 \text{ in.})\omega_A$



Since $v_E = 0$, *E* is instantaneous center of gear *D*.

$$v_T = 2r\omega_D$$

$$(3 \text{ in.})\omega_A = 2(3 \text{ in.})\omega_D$$

$$\omega_D = \frac{1}{2}\omega_A$$

$$v_D = r\omega_D = (3 \text{ in.})\frac{1}{2}\omega_A = (1.5 \text{ in.})\omega_A$$

Spider:

$$v_D = (6 \text{ in.})\omega_S$$

$$(1.5 \text{ in.})\omega_A = (6 \text{ in.})\omega_S$$

$$\omega_S = \frac{1}{4}\omega_A$$

$$\boldsymbol{\omega}_A = 150 \text{ rpm} = 15.708 \text{ rad/s} \circlearrowright$$

$$\boldsymbol{\omega}_D = \frac{1}{2}\omega_A = 7.854 \text{ rad/s} \circlearrowleft$$

$$\boldsymbol{\omega}_S = \frac{1}{4}\omega_A = 3.927 \text{ rad/s} \circlearrowright$$

Acceleration.

Spider: $\omega_S = 3.927 \text{ rad/s}$

$$a_D = (AD)\omega_S^2 = (6 \text{ in.})(3.927 \text{ rad/s})^2$$

$$\mathbf{a}_D = 92.53 \text{ in./s}^2 \nearrow$$

PROBLEM 15.119

The 200-mm-radius disk rolls without sliding on the surface shown. Knowing that the distance BG is 160 mm and that at the instant shown the disk has an angular velocity of 8 rad/s counterclockwise and an angular acceleration of 2 rad/s^2 clockwise, determine the acceleration of A.

SOLUTION

Units: m, m/s, m/s^2

Unit vectors: $\mathbf{i} = 1 \longrightarrow$, $\mathbf{j} = 1\uparrow$, $\mathbf{k} = 1 \circlearrowleft$

Geometric analysis. Let P be the point where the disk contacts the flat surface.

$$\mathbf{r}_{G/A} = 0.200\mathbf{j} \qquad \mathbf{r}_{B/G} = -0.16\mathbf{i}$$

$$\mathbf{r}_{A/B} = -\sqrt{0.600}\mathbf{i} - 0.200\mathbf{j}$$

Velocity analysis. $\boldsymbol{\omega}_G = (8 \text{ rad/s})\mathbf{k}, \quad \mathbf{v}_P = 0, \ \mathbf{v}_A = v_A\mathbf{i}$

$$\mathbf{v}_B = \mathbf{v}_P + \mathbf{v}_{G/P} = \mathbf{v}_P + \boldsymbol{\omega}_G \times \mathbf{r}_{G/P}$$

$$= 0 + 8\mathbf{k} \times (-0.160\mathbf{i} + 0.200\mathbf{j}) = -1.6\mathbf{i} - 1.28\mathbf{j}$$

$$\mathbf{v}_A = \mathbf{v}_B + \mathbf{v}_{A/B} = \mathbf{v}_B + \boldsymbol{\omega}_{AB} \times \mathbf{r}_{A/B}$$

$$v_A\mathbf{i} = -1.6\mathbf{i} - 1.28\mathbf{j} + \omega_{AB}\mathbf{k} \times (-\sqrt{0.600}\mathbf{i} - 0.200\mathbf{j})$$

$$= -1.6\mathbf{i} - 1.28\mathbf{j} - 0.77460\omega_{AB}\mathbf{j} + 0.2\omega_{AB}\mathbf{i}$$

Resolve into components and transpose terms.

$\mathbf{j}$: $\quad 0.77460\omega_{AB} = -1.28 \qquad \omega_{AB} = -1.6525 \text{ rad/s}$ ◀

Acceleration analysis: $\mathbf{a}_A = \mathbf{a}_A\mathbf{j}, \quad \mathbf{a}_G = -2 \text{ rad/s}^2\mathbf{k}$

$$\mathbf{a}_P = (\omega_G^2 r)\mathbf{j} = (8)^2(0.2)\mathbf{j} = (12.8 \text{ m/s}^2)\mathbf{j}$$

$$\mathbf{a}_B = \mathbf{a}_P + \mathbf{a}_{B/P} = \mathbf{a}_P + \mathbf{a}_G \times \mathbf{r}_{B/P} - \omega_G^2\mathbf{r}_{B/P}$$

$$= 12.8\mathbf{j} + (-2\mathbf{k}) \times (-0.160\mathbf{i} + 0.200\mathbf{j}) - (8)^2(-0.160\mathbf{i} + 0.200\mathbf{j})$$

$$= 12.8\mathbf{j} + 0.32\mathbf{j} + 0.4\mathbf{i} + 10.24\mathbf{i} - 12.8\mathbf{j}$$

$$= 10.64\mathbf{i} + 0.32\mathbf{j}$$

$$\mathbf{a}_A = \mathbf{a}_B + \mathbf{a}_{A/B} = \mathbf{a}_B + \alpha_{AB}\mathbf{k} \times \mathbf{r}_{A/B} - \omega_{AB}^2\mathbf{r}_{A/B}$$

$$= 10.64\mathbf{i} + 0.32\mathbf{j} + \alpha_{AB}\mathbf{k} \times (-\sqrt{0.600}\mathbf{i} - 0.200\mathbf{j}) - (1.6525)^2(-\sqrt{0.600}\mathbf{i} - 0.200\mathbf{j})$$

$$= 10.64\mathbf{i} + 0.32\mathbf{j} - 0.77460\alpha_{AB}\mathbf{j} + 0.2\alpha_{AB}\mathbf{i} + 2.115\mathbf{i} + 0.54615\mathbf{j}$$

$$a_A\mathbf{i} = 12.755\mathbf{i} + 0.86615\mathbf{j} + 0.2\alpha_{AB}\mathbf{i} - 0.77460\alpha_{AB}\mathbf{j}$$

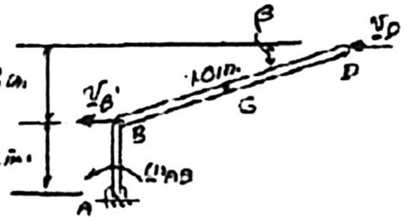
PROBLEM 15.124

Arm AB has a constant angular velocity of 16 rad/s counterclockwise. At the instant when $\theta = 90°$, determine the acceleration (*a*) of collar D, (*b*) of the midpoint G of bar BD.

SOLUTION



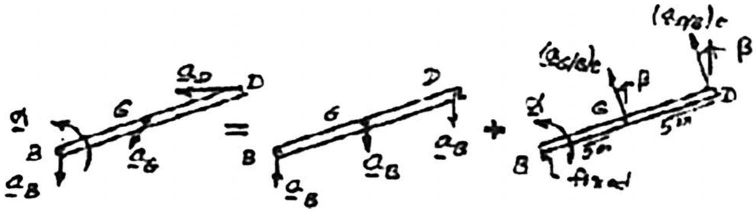
Rod AB:

$$a_B = (AB)\omega_{AB}^2$$
$$= (3 \text{ in.})(16 \text{ rad/s})^2$$
$$\mathbf{a}_B = 768 \text{ in./s}^2 \downarrow$$

Rod BD: instantaneous center is at OD; $\boldsymbol{\omega}_{BD} = 0$

$$\sin\beta = (3 \text{ in.})/(10 \text{ in.}) = 0.3; \quad \beta = 17.46°$$

<u>Acceleration</u>.

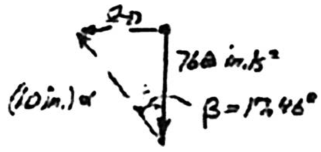


<u>Plane motion</u> = <u>Trans. with B</u> + <u>Rotation about B</u>

(*a*)

$$\mathbf{a}_D = \mathbf{a}_B + \mathbf{a}_{D/B} = a_B + (\mathbf{a}_{D/B})_t + (\mathbf{a}_{D/B})_n$$
$$= [a_B \downarrow] + [(BD)\alpha \nwarrow \beta] + [(BD)\omega_{BD}^2 \angle \beta]$$
$$= [768 \text{ in./s}^2 \downarrow] + [(10 \text{ in.})\alpha \nwarrow \beta] + [(10 \text{ in.})(0)^2 \angle \beta]$$
$$\mathbf{a}_D \leftrightarrow = [768 \text{ in./s} \downarrow] + [(10 \text{ in.})\alpha \nwarrow \beta]$$

Vector diagram:



$$\mathbf{a}_D = (768 \text{ in./s}^2)\tan 17.46°$$
$$= 241.62 \text{ in./s}^2$$

$$\mathbf{a}_D = 242 \text{ in./s}^2 \longleftarrow \blacktriangleleft$$

$$(10 \text{ in.})\alpha = (768 \text{ in./s}^2)/\cos 17.46°$$
$$(10 \text{ in.})\alpha = 805.08 \text{ in./s}^2$$
$$\boldsymbol{\alpha} = 80.5 \text{ rad/s}^2 \circlearrowleft$$

PROBLEM 15.126

A straight rack rests on a gear of radius $r = 3$ in. and is attached to a block B as shown. Knowing that at the instant shown $\theta = 20°$, the angular velocity of gear D is 3 rad/s clockwise, and it is speeding up at a rate of 2 rad/s^2, determine (*a*) the angular acceleration of *AB*, (*b*) the acceleration of block *B*.

SOLUTION

Let Point P on the gear and Point Q on the rack be located at the contact point between them.

Units: inches, in./s, in./s^2

Unit vectors: $\mathbf{i} = 1 \longrightarrow$, $\mathbf{j} = 1 \uparrow$, $\mathbf{k} = 1$ ↺

Geometry: $\mathbf{r}_{P/D} = 3(\sin\theta\mathbf{i} + \cos\theta\mathbf{j})$

$$\mathbf{r}_{B/Q} = \frac{3}{\tan\theta}(\cos\theta\mathbf{i} - \sin\theta\mathbf{j})$$

$$\theta = 20°$$

Gear D: $\boldsymbol{\omega}_{\text{gear}} = 3\text{ rad/s}$ ↻ $\qquad \boldsymbol{\alpha}_{\text{gear}} = 2\text{ rad/s}^2$ ↻

$v_P = \omega_{\text{gear}} r = (3)(3) = 9\text{ in./s} \qquad \mathbf{v}_P = 9\text{ in./s} \searrow \theta$

$(a_P)_n = \omega_{\text{gear}}^2 r = (3)^2(3) = 27\text{ in./s}^2 \qquad (\mathbf{a}_P)_n = 27\text{ in./s}^2 \swarrow \theta$

$(a_P)_t = \alpha_{\text{gear}} r = (2)(3) = 6\text{ in./s}^2 \qquad (\mathbf{a}_P)_t = 6\text{ in./s}^2 \searrow \theta$

Velocity analysis.

Gear to rack contact: $\mathbf{v}_Q = \mathbf{v}_P = 9\text{ in./s} \searrow \theta$

Rack *AQB*: $\boldsymbol{\omega}_{AB} = \omega_{AB}$ ↺, $\qquad \boldsymbol{\alpha}_{AB} = \alpha_{AB}$ ↺

$\mathbf{v}_B = v_B \longrightarrow, \qquad \mathbf{a}_B = a_B \longrightarrow$

$$\mathbf{v}_B = \mathbf{v}_Q + \mathbf{v}_{B/Q} = \mathbf{v}_Q + \omega_{AB}\mathbf{k} \times \mathbf{r}_{B/Q}$$

$$v_B\mathbf{i} = 9(\cos\theta\mathbf{i} - \sin\theta\mathbf{j}) + \omega_{AB}\mathbf{k} \times (7.74535\mathbf{i} - 2.81908\mathbf{j})$$

$$= (9\cos\theta + 2.81907\omega_{AB})\mathbf{i} + (-9\sin\theta + 2.81907\omega_{AB})\mathbf{j}$$

Equating like components,

j: $\qquad 0 = -9\sin\theta + 7.74535\omega_{AB}$

$\omega_{AB} = 0.39742 \qquad \omega_{AB} = 0.39742\text{ rad/s}$ ↺

PROBLEM 15.131

Knowing that at the instant shown bar *AB* has a constant angular velocity of 4 rad/s clockwise, determine the angular acceleration (*a*) of bar *BD*, (*b*) of bar *DE*.

SOLUTION

Relative position vectors.

$$\mathbf{r}_{B/A} = -(20\text{ in.})\mathbf{i} - (40\text{ in.})\mathbf{j}$$
$$\mathbf{r}_{D/B} = (40\text{ in.})\mathbf{i}$$
$$\mathbf{r}_{D/E} = (20\text{ in.})\mathbf{i} - (25\text{ in.})\mathbf{j}$$

Velocity analysis.

Bar *AB* (Rotation about *A*):

$$\boldsymbol{\omega}_{AB} = 4\text{ rad/s} \circlearrowright = -(4\text{ rad/s})\mathbf{k}$$

$$\mathbf{r}_{B/A} = -(20\text{ in.})\mathbf{i} - (40\text{ in.})\mathbf{j} \qquad \mathbf{v}_B = \boldsymbol{\omega}_{AB} \times \mathbf{r}_{B/A} = (-4\mathbf{k}) \times (-20\mathbf{i} - 40\mathbf{j})$$
$$\mathbf{v}_B = -(160\text{ in./s})\mathbf{i} + (80\text{ in./s})\mathbf{j}$$

Bar *BD* (Plane motion = Translation with *B* + Rotation about *B*):

$$\boldsymbol{\omega}_{BD} = \omega_{BD}\mathbf{k} \qquad \mathbf{r}_{D/B} = (40\text{ in.})\mathbf{i}$$
$$\mathbf{v}_D = \mathbf{v}_B + \boldsymbol{\omega}_{BD} \times \mathbf{r}_{D/B} = \mathbf{v}_B + (\omega_{BD}\mathbf{k}) \times (40\mathbf{i})$$
$$\mathbf{v}_D = -(160\text{ in/s})\mathbf{i} + (40\omega_{BD} + 80\text{ in./s})\mathbf{j}$$

Bar *DE* (Rotation about *E*):

$$\boldsymbol{\omega}_{DE} = \omega_{DE}\mathbf{k}$$
$$\mathbf{r}_{D/E} = (20\text{ in.})\mathbf{i} - (25\text{ in.})\mathbf{j}$$
$$\mathbf{v}_D = \boldsymbol{\omega}_{DE} \times \mathbf{r}_{D/E} = (\omega_{DE}\mathbf{k}) \times (20\mathbf{i} - 25\mathbf{j})$$
$$\mathbf{v}_D = 20\omega_{DE}\mathbf{j} + 25\omega_{DE}\mathbf{i}$$

Equating components of the two expression for $\mathbf{v}_D$,

i: $\quad -160 = 25\omega_{DE} \qquad \omega_{DE} = -6.4\text{ rad/s}$

j: $\quad 40\omega_{BE} + 80 = 20\omega_{DE} \qquad 40\omega_{BD} + 80 = 20(-6.4) \qquad \omega_{BD} = -5.2\text{ rad/s}$

Summary of angular velocities: $\boldsymbol{\omega}_{AB} = 4\text{ rad/s}$ ↻ $\boldsymbol{\omega}_{DE} = 6.4\text{ rad/s}$ ↻ $\boldsymbol{\omega}_{BD} = 5.2\text{ rad/s}$ ↻

Acceleration analysis. $\boldsymbol{\alpha}_{AB} = 0, \quad \boldsymbol{\alpha}_{BD} = \alpha_{BD}\mathbf{k}, \quad \boldsymbol{\alpha}_{DE} = \alpha_{DE}\mathbf{k}$

Bar AB (Rotation about A):

$$\mathbf{a}_B = \boldsymbol{\alpha}_{AB} \times \mathbf{r}_{B/A} - \omega_{AB}^2 \mathbf{r}_{B/A}$$
$$= 0 - (4)^2(-20\mathbf{i} - 40\mathbf{j})$$
$$= (320\text{ in./s}^2)\mathbf{i} + (640\text{ in./s}^2)\mathbf{j}$$

Bar BD (Translation with B + Rotation about B):

$$\mathbf{a}_D = \mathbf{a}_B + \boldsymbol{\alpha}_{BD} \times \mathbf{r}_{D/B} - \omega_{BD}^2\ \mathbf{r}_{D/B}$$
$$= 320\mathbf{i} + 640\mathbf{j} + \alpha_{BD}\mathbf{k} \times (40\mathbf{i}) - (5.2)^2(40)\mathbf{i}$$
$$= 320\mathbf{i} + 640\mathbf{j} + 40\alpha_{BD}\mathbf{j} - 1081.6\mathbf{i}$$
$$= -761.60\mathbf{i} + (640 + 40\alpha_{BD})\mathbf{j} \qquad (1)$$

Bar DE (Rotation about E):

$$\mathbf{a}_D = \boldsymbol{\alpha}_{DE} \times \mathbf{r}_{D/E} - \omega_{DE}^2 \mathbf{r}_{D/E}$$
$$= \alpha_{DE}\mathbf{k} \times (20\mathbf{i} - 25\mathbf{j}) - (6.4)^2(20\mathbf{i} - 25\mathbf{j})$$
$$= -20\alpha_{DE}\mathbf{j} + 25\alpha_{DE}\mathbf{i} - 819.20\mathbf{i} + 1024\mathbf{j}$$
$$= (25\alpha_{DE} - 819.20)\mathbf{i} + (20\alpha_{DE} + 1024)\mathbf{j} \qquad (2)$$

Equate like components of $\mathbf{a}_D$ expressed by Eqs. (1) and (2).

i: $-761.60 = 25\alpha_{DE} - 819.20 \qquad \alpha_{DE} = 2.3040\text{ rad/s}^2$

j: $640 + 40\alpha_{BD} = (20)(2.304) + 1024 \qquad \alpha_{BD} = 10.752\text{ rad/s}^2$

(*a*) Angular acceleration of bar *BD*. $\boldsymbol{\alpha}_{BD} = 10.75\text{ rad/s}^2$ ↺ ◀

(*b*) Angular acceleration of bar *DE*. $\boldsymbol{\alpha}_{DE} = 2.30\text{ rad/s}^2$ ↺ ◀

PROBLEM 15.132

Knowing that at the instant shown bar *AB* has a constant angular velocity of 4 rad/s clockwise, determine the angular acceleration (*a*) of bar *BD*, (*b*) of bar *DE*.

SOLUTION

Velocity analysis.

<u>Bar *AB*</u> (Rotation about *A*): $\boldsymbol{\omega}_{AB} = 4 \text{ rad/s} \circlearrowright = -(4 \text{ rad/s})\mathbf{k}$

$$\mathbf{r}_{B/A} = -(175 \text{ mm})\mathbf{i} \qquad \mathbf{v}_B = \boldsymbol{\omega}_{AB} \times \mathbf{r}_{B/A} = (-4\mathbf{k}) \times (-175\mathbf{i})$$

$$\mathbf{v}_B = (700 \text{ mm/s})\mathbf{j}$$

<u>Bar *BD*</u> (Plane motion = Translation with B + Rotation about B):

$$\boldsymbol{\omega}_{BD} = \omega_{BD}\mathbf{k} \qquad \mathbf{r}_{D/B} = -(200 \text{ mm})\mathbf{j}$$

$$\mathbf{v}_D = \mathbf{v}_B + \boldsymbol{\omega}_{BD} \times \mathbf{r}_{D/B} = 700\mathbf{j} + (\omega_{BD}\mathbf{k}) \times (-200\mathbf{j})$$

$$\mathbf{v}_D = 700\mathbf{j} + 200\omega_{BD}\mathbf{i}$$

<u>Bar *DE*</u> (Rotation about E): $\boldsymbol{\omega}_{DE} = \omega_{DE}\mathbf{k}$

$$\mathbf{r}_{D/E} = -(275 \text{ mm})\mathbf{i} + (75 \text{ mm})\mathbf{j}$$

$$\mathbf{v}_D = \boldsymbol{\omega}_{DE} \times \mathbf{r}_{D/E} = (\omega_{DE}\mathbf{k}) \times (-275\mathbf{i} + 75\mathbf{j})$$

$$\mathbf{v}_D = -275\omega_{DE}\mathbf{j} - 75\omega_{DE}\mathbf{i}$$

Equating components of the two expressions for $\mathbf{v}_D$,

$\mathbf{j}$: $700 = -275\omega_{DE}$ $\quad \omega_{DE} = -2.5455 \text{ rad/s}$ $\quad \boldsymbol{\omega}_{DE} = 2.55 \text{ rad/s} \circlearrowright$

$\mathbf{i}$: $200\omega_{BD} = -75\omega_{BD}$ $\quad \omega_{DE} = -\dfrac{3}{8}\omega_{BD}$

$$\omega_{BD} = -\left(\frac{3}{8}\right)(-2.5455) = 0.95455 \text{ rad/s} \qquad \boldsymbol{\omega}_{BD} = 0.955 \text{ rad/s} \circlearrowleft$$

Acceleration analysis. $\boldsymbol{\alpha}_{AB} = 0$

<u>Bar *AB*</u>: $\mathbf{a}_B = -\omega_{AB}^2\mathbf{r}_{B/A} = -(4)^2(-175\mathbf{i}) = (2800 \text{ mm/s}^2)\mathbf{i}$

<u>Bar *BD*</u>: $\boldsymbol{\alpha}_{BD} = \alpha_{BD}\mathbf{k}$

$$\mathbf{a}_D = \mathbf{a}_B + \boldsymbol{\alpha}_{BD} \times \mathbf{r}_{D/B} - \omega_{BD}^2\mathbf{r}_{D/B}$$

$$= 2800\mathbf{i} + \alpha_{BD}\mathbf{k} \times (-200\mathbf{j}) - (0.95455)^2(-200\mathbf{j})$$

$$= (2800 + 200\,\alpha_{BD})\mathbf{i} + 182.23\mathbf{j} \qquad (1)$$

PROBLEM 15.135

Robert's linkage is named after Richard Robert (1789–1864) and can be used to draw a close approximation to a straight line by locating a pen at Point *F*. The distance *AB* is the same as *BF*, *DF* and *DE*. Knowing that at the instant shown bar *AB* has a constant angular velocity of 4 rad/s clockwise, determine (*a*) the angular acceleration of bar *DE*, (*b*) the acceleration of Point *F*.

SOLUTION

Units: inches, in./s, in./s^2

Unit vectors: $\mathbf{i} = 1 \longrightarrow, \; \mathbf{j} = 1\uparrow, \; \mathbf{k} = 1 \circlearrowleft.$

Geometry:

$$\mathbf{r}_{B/A} = 3\mathbf{i} + \sqrt{12^2 - 3^2}\,\mathbf{j} = 3\mathbf{i} + \sqrt{135}\,\mathbf{j}$$

$$\mathbf{r}_{D/B} = 6\mathbf{i} \qquad \mathbf{r}_{F/B} = 3\mathbf{i} - \sqrt{135}\,\mathbf{j}$$

$$\mathbf{r}_{D/E} = -3\mathbf{i} + \sqrt{135}\,\mathbf{j}$$

Velocity analysis: $\boldsymbol{\omega}_{AB} = 4 \text{ rad/s}^2 \circlearrowright = -4\,\mathbf{k}$

Bar *AB*: $\mathbf{v}_B = \boldsymbol{\omega}_{AB} \times \mathbf{r}_{B/A} = -4\mathbf{k} \times (3\mathbf{i} + \sqrt{135}\,\mathbf{j}) = 4\sqrt{135}\,\mathbf{i} - 12\mathbf{j}$

Object *BDF*:

$$\mathbf{v}_D = \mathbf{v}_B + \mathbf{v}_{D/B} = \mathbf{v}_B + \boldsymbol{\omega}_{BD} \times \mathbf{r}_{D/B}$$
$$= 4\sqrt{135}\,\mathbf{i} - 12\mathbf{j} + \omega_{BD}\mathbf{k} \times 6\mathbf{i}$$
$$= 4\sqrt{135}\,\mathbf{i} - 12\mathbf{j} + 6\omega_{BD}\mathbf{j} \qquad (1)$$

Bar *DE*:

$$\mathbf{v}_D = \omega_{DE} \times \mathbf{r}_{D/E} = \omega_{DE}\mathbf{k} \times (-3\mathbf{i} + \sqrt{135}\,\mathbf{j})$$
$$= -\sqrt{135}\,\omega_{DE}\mathbf{i} - 3\omega_{DE}\mathbf{j} \qquad (2)$$

Equating like components of $\mathbf{v}_D$ from Eqs. (1) and (2),

$$\mathbf{i}: \qquad 4\sqrt{135} = -\sqrt{135}\,\omega_{DE} \qquad (3)$$

$$\mathbf{j}: \qquad -12 + 6\omega_{BD} = -3\omega_{DE} \qquad (4)$$

From Eq. (3), $\omega_{DE} = -4 \qquad \omega_{DE} = 5 \text{ rad/s} \circlearrowright$

From Eq. (4), $\omega_{BD} = \dfrac{1}{6}(12 - 3\omega_{DE}) = 5 \qquad \omega_{BD} = 4 \text{ rad/s} \circlearrowright$

Acceleration Analysis: $\boldsymbol{\alpha}_{AB} = 0$

Bar AB:

$$\mathbf{a}_B = \boldsymbol{\alpha}_{AB} \times \mathbf{r}_{B/A} - \omega_{AB}^2 \mathbf{r}_{B/A}$$
$$= 0 - (4)^2(3\mathbf{i} + \sqrt{135}\mathbf{j})$$
$$= -48\mathbf{i} - 16\sqrt{135}\mathbf{j}$$

Object BDF:

$$\mathbf{a}_D = \mathbf{a}_B + \mathbf{a}_{D/B} = \mathbf{a}_B + \boldsymbol{\alpha}_{BD} \times \mathbf{r}_{D/B} - \omega_{BD}^2 \mathbf{r}_{D/B}$$

$$\mathbf{a}_D = -48\mathbf{i} - 16\sqrt{135}\mathbf{j} + \alpha_{BD}\mathbf{k} \times (6\mathbf{i}) - (4)^2(6\mathbf{i})$$
$$= -144\mathbf{i} - 16\sqrt{135}\mathbf{j} + 6\alpha_{BD}\mathbf{j} \tag{5}$$

Bar DE:

$$\mathbf{a}_D = \boldsymbol{\alpha}_{DE} \times \mathbf{r}_{D/E} - \omega_{DE}^2 \mathbf{r}_{D/E}$$

$$\mathbf{a}_D = \alpha_{DE}\mathbf{k} \times (-3\mathbf{i} + \sqrt{135}\mathbf{j}) - (4)^2(-3\mathbf{i} + \sqrt{135}\mathbf{j})$$
$$= -\sqrt{135}\alpha_{DE}\mathbf{i} - 3\alpha_{DE}\mathbf{j} + 48\mathbf{i} - 16\sqrt{135}\mathbf{j} \tag{6}$$

Equating like components of $\mathbf{a}_D$ from Eqs. (5) and (6),

$$\mathbf{i}: \quad -144 = -\sqrt{135}\alpha_{DE} + 48 \tag{7}$$

$$\mathbf{j}: \quad -16\sqrt{135} + 6\alpha_{BD} = -3\alpha_{DE} - 16\sqrt{135} \tag{8}$$

From Eq. (7), $\alpha_{DE} = \dfrac{192}{\sqrt{135}}$

From Eq. (8), $\alpha_{BD} = -\dfrac{1}{2}\alpha_{BD} = -\dfrac{96}{\sqrt{135}}$

(*a*) Angular acceleration of bar DE: $\boldsymbol{\alpha}_{DE} = 16.53 \text{ rad/s}^2$ ⤸ ◀

(*b*) Acceleration of Point F:

$$\mathbf{a}_F = \mathbf{a}_B + \mathbf{a}_{F/B} = \mathbf{a}_B + \alpha_{BD} \times \mathbf{r}_{F/B} - \omega_{BD}^2 \mathbf{r}_{F/B}$$
$$= -48\mathbf{i} - 16\sqrt{135}\mathbf{j} + \left(-\frac{96}{\sqrt{135}}\mathbf{k}\right) \times (3\mathbf{i} - \sqrt{135}\mathbf{j}) - (4)^2(3\mathbf{i} - \sqrt{135}\mathbf{j})$$
$$= -48\mathbf{i} - 16\sqrt{135}\mathbf{j} - \frac{288}{\sqrt{135}}\mathbf{j} - 96\mathbf{i} - 48\mathbf{i} + 16\sqrt{135}\mathbf{j}$$
$$= -192\mathbf{i} - \frac{288}{\sqrt{135}}\mathbf{j}$$

$$\mathbf{a}_F = -(192.0 \text{ in./s}^2)\mathbf{i} - (24.8 \text{ in./s}^2)\mathbf{j} = 193.6 \text{ in./s}^2 \measuredangle 7.36^\circ \blacktriangleleft$$

PROBLEM 15.136

For the oil pump rig shown, link AB causes the beam BCE to oscillate as the crank OA revolves. Knowing that OA has a radius of 0.6 m and a constant clockwise angular velocity of 20 rpm, determine the velocity and acceleration of Point D at the instant shown.

SOLUTION

Units: meters, m/s, m/s^2

Unit vectors: $\mathbf{i} = 1 \longrightarrow, \quad \mathbf{j} = 1 \uparrow, \quad \mathbf{k} = 1 \circlearrowleft.$

Crank OA: $\mathbf{r}_{OA} = 0.6 \text{ m}, \quad \boldsymbol{\omega}_{OA} = 20 \text{ rpm} \circlearrowright = 2.0944 \text{ rad/s} \circlearrowright$

$$\mathbf{v}_A = \omega_{OA} r_{OA} = (2.0944)(0.6) \qquad \mathbf{v}_A = 1.25664 \text{ m/s} \uparrow$$

$$\boldsymbol{\alpha}_{OA} = 0 \qquad (a_A)_t = 0$$

$$(\mathbf{a}_A)_n = \omega_{OA}^2 r_{OA} = (2.0944)^2(0.6) = 2.6319 \text{ m/s}^2$$

$$\mathbf{a}_A = 2.6319 \text{ m/s}^2 \longrightarrow$$

Rod AB: $\mathbf{v}_B = v_A \uparrow,$

Since $\mathbf{v}_B$ and $\mathbf{v}_A$ are parallel, $\mathbf{v}_A = \mathbf{v}_B$ and $\omega_{AB} = 0.$

$$\mathbf{v}_B = 1.25664 \text{ m/s} \uparrow$$

$$\begin{aligned}\mathbf{a}_B &= \mathbf{a}_A + \mathbf{a}_{B/A} = \mathbf{a}_A + \alpha_{AB}\mathbf{k} \times \mathbf{r}_{B/A} - \omega_{AB}^2 \mathbf{r}_{B/A} \\ &= 2.6319\mathbf{i} + \alpha_{AB}\mathbf{k} \times (0.6\mathbf{i} + 2\mathbf{j}) - 0 \\ &= (2.6319 - 2\alpha_{AB})\mathbf{i} + 0.6\alpha_{AB}\mathbf{j} \qquad (1)\end{aligned}$$

Beam BCE: Point C is a pivot.

$$v_B = \omega_{BCE} r_{BC} \qquad \omega_{BCE} = \frac{v_B}{r_{BC}} = \frac{1.25664}{3} = 0.41888$$

$$v_E = \omega_{BCE} r_{CE} = (0.41888)(3.3) = 1.38230$$

$$\boldsymbol{\omega}_{BCE} = 0.41888 \text{ rad/s} \circlearrowright \qquad \mathbf{v}_E = 1.38230 \text{ m/s} \downarrow$$

$$\begin{aligned}\mathbf{a}_B &= \boldsymbol{\alpha}_{BCE} \times \mathbf{r}_{B/C} - \omega_{BCE}^2 r_{B/C} \\ &= \alpha_{BCE}\mathbf{k} \times (-3\mathbf{i}) - (0.41888)^2(-3\mathbf{i}) \\ &= 0.52638\mathbf{i} - 3\alpha_{BCE}\mathbf{j} \qquad (2)\end{aligned}$$

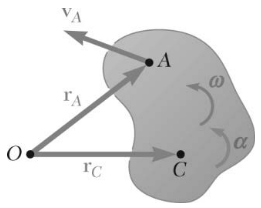
PROBLEM 15.137



Denoting by $\mathbf{r}_A$ the position vector of Point A of a rigid slab that is in plane motion, show that (a) the position vector $\mathbf{r}_C$ of the instantaneous center of rotation is

$$\mathbf{r}_C = \mathbf{r}_A + \frac{\boldsymbol{\omega} \times \mathbf{v}_A}{\omega^2}$$

where $\boldsymbol{\omega}$ is the angular velocity of the slab and $\mathbf{v}_A$ is the velocity of Point A, (b) the acceleration of the instantaneous center of rotation is zero if, and only if,

$$\mathbf{a}_A = \frac{\alpha}{\omega}\mathbf{v}_A + \boldsymbol{\omega} \times \mathbf{v}_A$$

where $\boldsymbol{\alpha} = \alpha\mathbf{k}$ is the angular acceleration of the slab.

SOLUTION

(a) At the instantaneous center C, $\mathbf{v}_C = 0$

$$\mathbf{v}_A = \mathbf{v}_C + \boldsymbol{\omega}\times\mathbf{r}_{A/C} = \boldsymbol{\omega}\times\mathbf{r}_{A/C}$$

$$\boldsymbol{\omega}\times\mathbf{v}_A = \boldsymbol{\omega}\times(\boldsymbol{\omega}\times\mathbf{r}_{A/C}) = -\omega^2\mathbf{r}_{A/C}$$

$$\mathbf{r}_{A/C} = -\frac{\boldsymbol{\omega}\times\mathbf{v}_A}{\omega^2} = -\mathbf{r}_{C/A} \qquad \text{or} \qquad \mathbf{r}_{C/A} = \frac{\boldsymbol{\omega}\times\mathbf{v}_A}{\omega^2}$$

$$\mathbf{r}_C - \mathbf{r}_A = -\frac{\boldsymbol{\omega}\times\mathbf{v}_A}{\omega^2}$$

$$\mathbf{r}_C = \mathbf{r}_A + \frac{\boldsymbol{\omega}\times\mathbf{v}_A}{\omega^2} \blacktriangleleft$$

(b)

$$\mathbf{a}_A = \mathbf{a}_C + \boldsymbol{\alpha}\times\mathbf{r}_{A/C} + \boldsymbol{\omega}\times\mathbf{v}_{A/C}$$

$$= \mathbf{a}_C - \alpha\mathbf{k}\times\frac{\boldsymbol{\omega}\times\mathbf{v}_A}{\omega^2} + \boldsymbol{\omega}\times(\mathbf{v}_A - \mathbf{v}_C)$$

$$= \mathbf{a}_C - \frac{\alpha\omega}{\omega^2}\mathbf{k}\times(\mathbf{k}\times\mathbf{v}_A) + \boldsymbol{\omega}\times\mathbf{v}_A$$

$$= \mathbf{a}_C + \frac{\alpha}{\omega}\mathbf{v}_A + \boldsymbol{\omega}\times\mathbf{v}_A$$

Set $\mathbf{a}_C = 0$.

$$\mathbf{a}_A = \frac{\alpha}{\omega}\mathbf{v}_A + \boldsymbol{\omega}\times\mathbf{v}_A \blacktriangleleft$$

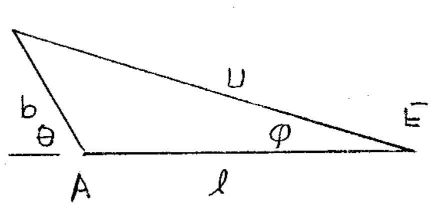
PROBLEM 15.144

Crank AB rotates with a constant clockwise angular velocity $\boldsymbol{\omega}$. Using the method of Section 15.9, derive expressions for the angular velocity of rod BD and the velocity of the point on the rod coinciding with Point E in terms of θ, ω, b, and l.

SOLUTION

Law of cosines for triangle ABE.



$$u^2 = l^2 + b^2 - 2bl\cos(180° - \theta)$$
$$= l^2 + b^2 + 2bl\cos\theta$$
$$\cos\varphi = \frac{l + b\cos\theta}{u}$$
$$\tan\varphi = \frac{b\sin\theta}{l + b\cos\theta}$$

$$\frac{d}{dt}(\tan\varphi) = \sec^2\varphi\dot{\varphi} = \frac{(l + b\cos\theta)(b\cos\theta)\dot{\theta} + (b\sin\theta)(b\cos\theta)\dot{\theta}}{(l + b\cos\theta)^2}$$

$$\dot{\varphi} = \frac{(\cos^2\varphi)[bl\cos\theta + b^2(\cos^2\theta + \sin^2\theta)]\dot{\theta}}{(l + b\cos\theta)^2}$$
$$= \frac{bl\cos\theta + b^2}{u^2}\dot{\theta} = \frac{b(b + l\cos\theta)}{l^2 + b^2 + 2bl\cos\theta}\dot{\theta}$$

But, $\dot{\theta} = \omega$, $\dot{\varphi} = \omega_{BD}$, and $v_E = -\dot{u}$

Hence,

$$\omega_{BD} = \frac{b(b + l\cos\theta)}{l^2 + b^2 + 2bl\cos\theta}\omega \circlearrowright ◀$$

Differentiate the expression for u^2.

$$2u\dot{u} = -2bl\sin\theta\dot{\theta}$$
$$v_E = -\dot{u} = \frac{bl\sin\theta}{l^2 + b^2 + 2bl\cos\theta}\omega$$

$$\mathbf{v}_E = \frac{bl\sin\theta}{l^2 + b^2 + 2bl\cos\theta}\omega \measuredangle \tan^{-1}\left(\frac{b\sin\theta}{l + b\cos\theta}\right) ◀$$

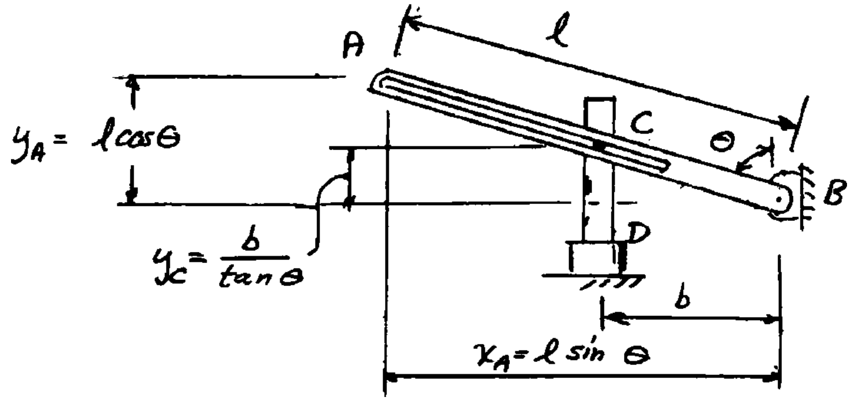
PROBLEM 15.146*

Pin C is attached to rod CD and slides in a slot cut in arm AB. Knowing that rod CD moves vertically upward with a constant velocity $\mathbf{v}_0$, derive an expression for (*a*) the angular velocity of arm AB, (*b*) the components of the velocity of Point A; and (*c*) an expression for the angular acceleration of arm AB.

SOLUTION



(*a*)

$$y_C = \frac{b\cos\theta}{\sin\theta}$$

$$v_C = v_0 = \frac{dy_C}{dt} = b\frac{d}{d\theta}\left(\frac{\cos\theta}{\sin\theta}\right)\frac{d\theta}{dt}$$

$$= b\frac{-\sin^2\theta - \cos^2\theta}{\sin^2\theta}\dot{\theta} = -\frac{b}{\sin^2\theta}\dot{\theta}$$

$$\dot{\theta} = -\frac{v_0\sin^2\theta}{b} \qquad (1)$$

But $\omega = \dot{\theta}$ $\qquad \boldsymbol{\omega} = \frac{v_0}{b}\sin^2\theta$ ↻ ◀

(*b*)

$$x_A = l\sin\theta$$

$$\dot{x}_A = l\cos\theta\dot{\theta} = -\frac{v_0 l}{b}(\sin^2\theta\cos\theta)$$

$$y_A = l\cos\theta$$

$$\dot{y}_A = -l\sin\theta\dot{\theta} = \frac{v_0 l}{b}\sin^3\theta \uparrow$$

PROBLEM 15.148*

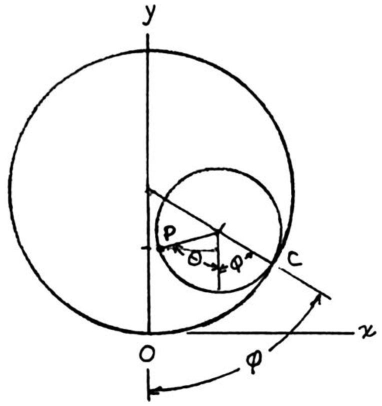
A wheel of radius r rolls without slipping along the inside of a fixed cylinder of radius R with a constant angular velocity $\boldsymbol{\omega}$. Denoting by P the point of the wheel in contact with the cylinder at $t = 0,$ derive expressions for the horizontal and vertical components of the velocity of P at any time t. (The curve described by Point P is a *hypocycloid*.)

SOLUTION

Define angles θ and φ as shown.

$$\dot{\theta} = \omega, \qquad \theta = \omega t$$

Since the wheel rolls without slipping, the arc OC is equal to arc PC.



$$r(\varphi + \theta) = R\varphi$$

$$\varphi = \frac{r\theta}{R - r}$$

$$\dot{\varphi} = \frac{r\dot{\theta}}{R - r} = \frac{r\omega}{R - r}$$

$$\varphi = \frac{r\omega t}{R - r}$$

$$x_P = (R - r)\sin\varphi - r\sin\theta$$

$$(v_P)_x = \dot{x}_P$$

$$= (R - r)\cos\varphi\dot{\varphi} - r\cos\theta\dot{\theta}$$

$$= (R - r)\left(\cos\frac{r\omega t}{R - r}\right)\left(\frac{r\omega}{R - r}\right) - r(\cos\omega t)(\omega)$$

$$(v_P)_x = r\omega\left(\cos\frac{r\omega t}{R - r} - \cos\omega t\right) \blacktriangleleft$$

$$y_P = R - (R - r)\cos\varphi - r\cos\theta$$

$$(v_P)_y = \dot{y}_P$$

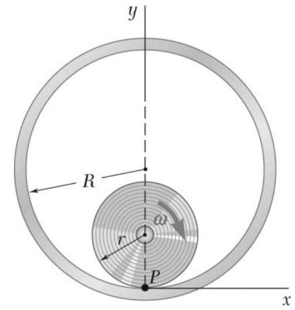
$$= (R - r)\sin\varphi\dot{\varphi} + r\sin\theta\dot{\theta}$$

$$= (R - r)\left(\sin\frac{r\omega t}{R - r}\right)\left(\frac{r\omega}{R - r}\right) + r(\sin\omega t)(\omega)$$

$$(v_P)_y = r\omega\left(\sin\frac{r\omega t}{R - r} + \sin\omega t\right) \blacktriangleleft$$

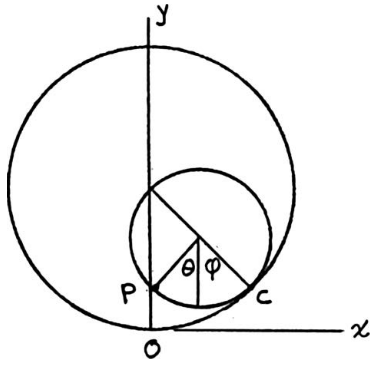
PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. If you are a student using this Manual, you are using it without permission.*

PROBLEM 15.149*



In Problem 15.148, show that the path of P is a vertical straight line when $r = R/2$. Derive expressions for the corresponding velocity and acceleration of P at any time t.

SOLUTION



Define angles θ and φ as shown.

$$\dot{\theta} = \omega, \quad \theta = \omega t, \quad \ddot{\theta} = 0$$

Since the wheel rolls without slipping, the arc OC is equal to arc PC.

$$r(\varphi + \theta) = R\theta$$
$$= 2r\theta$$
$$\varphi = 0$$
$$\dot{\varphi} = \dot{\theta} = \omega$$
$$\ddot{\varphi} = \ddot{\theta} = 0$$

$$x_P = (R - r)\sin\varphi - r\sin\theta$$
$$= r\sin\theta - r\sin\theta$$
$$= 0$$

The path is the y axis. ◀

$$y_P = R - (R - r)\cos\varphi - r\cos\theta$$
$$= R - r\cos\theta - r\cos\theta$$
$$= R(1 - \cos\theta)$$
$$v = \dot{y}_P = R\sin\theta\dot{\theta}$$

$\mathbf{v} = (R\omega\sin\omega t)\mathbf{j}$ ◀

$$a = \dot{v}$$
$$= (R\cos\theta\dot{\theta}^2 - \sin\theta\ddot{\theta})$$
$$= R\omega^2\cos\theta$$

$\mathbf{a} = (R\omega^2\cos\omega t)\mathbf{j}$ ◀

PROBLEM 15.CQ8

A person walks radially inward on a platform that is rotating counterclockwise about its center. Knowing that the platform has a constant angular velocity **ω** and the person walks with a constant speed **u** relative to the platform, what is the direction of the acceleration of the person at the instant shown?

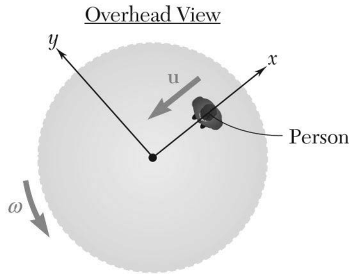
(*a*) Negative *x*

(*b*) Negative *y*

(*c*) Negative *x* and positive *y*

(*d*) Positive *x* and positive *y*

(*e*) Negative *x* and negative *y*



SOLUTION

The $\omega^2 r$ term will be in the negative *x*-direction and the Coriolis acceleration will be in the negative *y*-direction.

Answer: (*e*) ◀

PROBLEM 15.150

Pin P is attached to the collar shown; the motion of the pin is guided by a slot cut in rod BD and by the collar that slides on rod AE. Knowing that at the instant considered the rods rotate clockwise with constant angular velocities, determine for the given data the velocity of pin P.

$\omega_{AE} = 8$ rad/s, $\omega_{BD} = 3$ rad/s

SOLUTION

$$AB = 500 \text{ mm} = 0.5 \text{ m}, \quad AP = 0.5\tan 30°, \quad BP = \frac{0.5}{\cos 30°}$$

$$\boldsymbol{\omega}_{AE} = 8 \text{ rad/s} \circlearrowright, \qquad \boldsymbol{\omega}_{BD} = 3 \text{ rad/s} \circlearrowright$$

Let P' be the coinciding point on AE and u_1 be the outward velocity of the collar along the rod AE.

$$\mathbf{v}_P = \mathbf{v}_{P'} + \mathbf{v}_{P/AE} = [(AP)\omega_{AE} \downarrow] + [u_1 \longrightarrow]$$

Let P'' be the coinciding point on BD and u_2 be the outward speed along the slot in rod BD.

$$\mathbf{v}_P = \mathbf{v}_{P''} + \mathbf{v}_{P/BD} = [(BP)\omega_{BD} \searrow 30°] + [u_2 \measuredangle 60°]$$

Equate the two expressions for $\mathbf{v}_P$ and resolve into components.

$$\xrightarrow{+}: \quad u_1 = \left(\frac{0.5}{\cos 30°}\right)(3)(\cos 30°) + u_2 \cos 60°$$

or $$u_1 = 1.5 + 0.5u_2 \tag{1}$$

$$+\uparrow: \quad -(0.5\tan 30°)(8) = -\left(\frac{0.5}{\cos 30°}\right)(3)\sin 30° + u_2 \sin 60°$$

$$u_2 = \frac{1}{\sin 60°}[1.5\tan 30° - 4\tan 30°] = -1.66667 \text{ m/s}$$

From (1), $$u_1 = 1.5 + (0.5)(-1.66667) = 0.66667 \text{ m/s}$$

$$\mathbf{v}_P = [(0.5\tan 30°)(8) \downarrow] + [0.66667 \longrightarrow] = [2.3094 \text{ m/s} \downarrow] + [0.66667 \text{ m/s} \longrightarrow]$$

$$v_P = -\sqrt{2.3094^2 + 0.66667^2} = 2.4037 \text{ m/s}$$

$$\tan\beta = \frac{2.3094}{0.66667} \qquad \beta = 73.9°$$

$$\mathbf{v}_P = 2.40 \text{ m/s} \searrow 73.9° \blacktriangleleft$$

PROBLEM 15.155

Bar *AB* rotates clockwise with a constant angular velocity of 8 rad/s and rod *EF* rotates clockwise with a constant angular velocity of 6 rad/s. Determine at the instant shown (*a*) the angular velocity of bar *BD*, (*b*) the relative velocity of collar *D* with respect to rod *EF*.

SOLUTION

Bar AB. (Rotation about *A*) $\omega_{AB} = 8 \text{ rad/s} \circlearrowright$

$$\mathbf{v}_B = (12)(8) = 96 \text{ in./s} \longrightarrow$$

Rod EF. (Rotation about *E*) $\omega_{EF} = 6 \text{ rad/s.} \circlearrowright$

$$\mathbf{v}_{D'} = (12)(6) = 72 \text{ in./s} \longleftarrow$$

Bar BD. Assume angular velocity is $\omega_{BD} \circlearrowleft$.

Plane motion = Translation with *B* + Rotation about *B*.

$$\mathbf{v}_D = \mathbf{v}_B + \mathbf{v}_{D/B} = [96 \longrightarrow] + [24\omega_{BD} \uparrow] + [12\omega_{BD} \longrightarrow] \quad (1)$$

Collar D. Sliding on rotating rod *EF* with relative velocity $u \uparrow$.

$$\mathbf{v}_D = \mathbf{v}_{D'} + \mathbf{v}_{D/EF} = [72 \longleftarrow] + [u \uparrow] \quad (2)$$

Matching the expressions (1) and (2) for $\mathbf{v}_D$,

Components $\longrightarrow$: $96 + 12\omega_{BD} = -72$ $\qquad \omega_{BD} = -14$

(*a*) $\boldsymbol{\omega}_{BD} = 14.00 \text{ rad/s} \circlearrowright$ ◀

Components $\uparrow$: $24\omega_{BD} = u$ $\qquad u = (24)(-14) = -336 \text{ in./s}$

(*b*) $\mathbf{v}_{D/EF} = 28.0 \text{ ft/s} \downarrow$ ◀

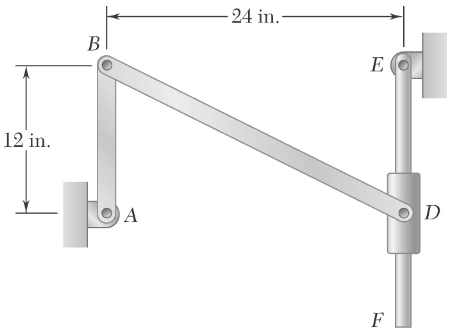
PROBLEM 15.156



Bar *AB* rotates clockwise with a constant angular velocity of 4 rad/s. Knowing that the magnitude of the velocity of collar *D* is 20 ft/s and that the angular velocity of bar *BD* is counterclockwise at the instant shown, determine (*a*) the angular velocity of bar *EF*, (*b*) the relative velocity of collar *D* with respect to rod *EF*.

SOLUTION

Bar AB. (Rotation about *A*) $\boldsymbol{\omega}_{AB} = 4 \text{ rad/s} \circlearrowright$

$$\mathbf{v}_B = (1 \text{ ft})(4 \text{ rad/s}) = 4 \text{ ft/s} \longrightarrow$$

Bar BD. Angular velocity is $\omega_{BD} \circlearrowleft$.

Plane motion = Translation with *B* + Rotation about *B*.

$$\mathbf{v}_D = \mathbf{v}_B + \mathbf{v}_{D/B} = [4 \longrightarrow] + [2\omega_{BD} \uparrow] + [1\omega_{BD} \longrightarrow]$$

Magnitude of $\mathbf{v}_D$: $v_D = 20$ ft/s

$$v_D^2 = (4 + \omega_{BD})^2 + (2\omega_{BD})^2 = (20)^2$$

$$5\omega_{BD}^2 + 8\omega_{BD} - 384 = 0$$

$$\omega_{BD} = \frac{-8 \pm 88}{10}$$

Positive root $\omega_{BD} = 8 \text{ rad/s} \circlearrowleft$

$$\mathbf{v}_D = [4 \longrightarrow] + [(2)(8) \uparrow] + [(1)(8) \longrightarrow] = [12 \longrightarrow] + [16 \uparrow] \quad (1)$$

Rod EF. (Rotation about *E*) Angular velocity = $\omega_{EF} \circlearrowleft$

$$\mathbf{v}_{D'} = [(1)\omega_{EF} \longrightarrow]$$

Collar D. Slides on rotating rod *EF* with relative velocity $u \uparrow$.

$$\mathbf{v}_D = \mathbf{v}_{D'} + \mathbf{v}_{D/EF} = [1\omega_{EF} \longrightarrow] + [u \uparrow] \quad (2)$$

Matching the expressions (1) and (2) for $\mathbf{v}_D$,

(*a*) Component $\longrightarrow$: $12 = 1\omega_{EF}$ $\boldsymbol{\omega}_{EF} = 12.00 \text{ rad/s} \circlearrowleft$ ◀

(*b*) Component $\uparrow$: $16 = u$ $\mathbf{v}_{D/EF} = 16 \text{ ft/s} \uparrow$ ◀

PROBLEM 15.157

The motion of pin P is guided by slots cut in rods AD and BE. Knowing that bar AD has a constant angular velocity of 4 rad/s clockwise and bar BE has an angular velocity of 5 rad/s counterclockwise and is slowing down at a rate of 2 rad/s^2, determine the velocity of P for the position shown.

SOLUTION

Units: meters, m/s, m/s^2

Unit vectors: $\mathbf{i} = 1 \longrightarrow, \quad \mathbf{j} = 1 \uparrow, \quad \mathbf{k} = 1 \circlearrowleft.$

Geometry: Slope angle θ of rod BE.

$$\tan\theta = \frac{0.15}{0.3} = 0.5 \qquad \theta = 26.565° \measuredangle$$

$$\mathbf{r}_{P/A} = 0.1\mathbf{i} + 0.15\mathbf{j} \qquad \mathbf{r}_{P/B} = -0.3\mathbf{i} + 0.15\mathbf{j}$$

Angular velocities: $\boldsymbol{\omega}_{AD} = -(4 \text{ rad/s})\mathbf{k} \qquad \boldsymbol{\omega}_{BE} = (5 \text{ rad/s})\mathbf{k}$

Angular accelerations: $\boldsymbol{\alpha}_{AD} = 0 \qquad \boldsymbol{\alpha}_{BE} = -(2 \text{ rad/s}^2)\mathbf{k}$

Velocity of Point P' on rod AD coinciding with the pin:

$$\mathbf{v}_{P'} = \boldsymbol{\omega}_{AD} \times \mathbf{r}_{P/A} = (-4\mathbf{k}) \times (0.1\mathbf{i} + 0.15\mathbf{j}) = 0.6\mathbf{i} - 0.4\mathbf{j}$$

Velocity of the pin relative to rod AD:

$$\mathbf{v}_{P/AD} = u_1 \uparrow = u_1\mathbf{j}$$

Velocity of P: $\mathbf{v}_P = \mathbf{v}_{P'} + \mathbf{v}_{P/AD} = 0.6\mathbf{i} - 0.4\mathbf{j} + u_1\mathbf{j}$

Velocity of Point P'' on rod BE coinciding with the pin:

$$\mathbf{v}_{P''} = \boldsymbol{\omega}_{BE} \times \mathbf{r}_{P/B} = 5\mathbf{k} \times (-0.3\mathbf{i} + 0.15\mathbf{j}) = -0.75\mathbf{i} - 1.5\mathbf{j}$$

Velocity of the pin relative to rod BE:

$$\mathbf{v}_{P/BE} = u_2 \nwarrow \theta = -u_2 \cos\theta\,\mathbf{i} + u_2 \sin\theta\,\mathbf{j}$$

Velocity of P:

$$\mathbf{v}_P = \mathbf{v}_{P''} + \mathbf{v}_{P/BE}$$
$$= -0.75\mathbf{i} - 1.5\mathbf{j} - u_2\cos\theta\,\mathbf{i} + u_2\sin\theta\,\mathbf{j}$$

If you are a student using this Manual, you are using it without permission.*

PROBLEM 15.157 (Continued)

Equating the two expressions for $\mathbf{v}_P$ and resolving into components,

i: $$0.6 = -0.75 - u_2 \cos\theta$$

$$u_2 = -\frac{1.35}{\cos 26.565°} = -1.50965$$

j: $$-0.4 + u_1 = -1.5 + u_2 \sin\theta$$

$$u_1 = -1.1 + (-1.50935)\sin 26.535° = -1.77500$$

Velocity of *P*:

$$\mathbf{v}_P = 0.6\mathbf{i} - 0.4\mathbf{j} - 1.775\mathbf{j} = 0.6\mathbf{i} - 2.175\mathbf{j}$$

$\mathbf{v}_P = 2.26$ m/s ⦪ 74.6° ◀

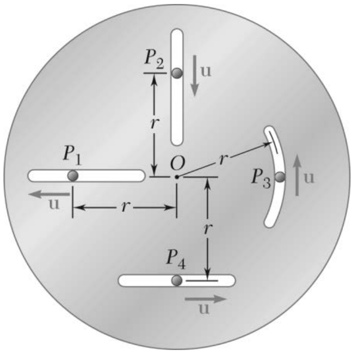
PROBLEM 15.158



Four pins slide in four separate slots cut in a circular plate as shown. When the plate is at rest, each pin has a velocity directed as shown and of the same constant magnitude u. If each pin maintains the same velocity relative to the plate when the plate rotates about O with a constant counterclockwise angular velocity ω, determine the acceleration of each pin.

SOLUTION

For each pin: $\mathbf{a}_P = \mathbf{a}_{P'} + \mathbf{a}_{P/F} + \mathbf{a}_C$

Acceleration of the coinciding Point P′ of the plate.

For each pin $\mathbf{a}_{P'} = r\omega^2$ towards the center O.

Acceleration of the pin relative to the plate.

For pins P_1, P_2 and P_4, $\mathbf{a}_{P/F} = 0$

For pin P_3, $\mathbf{a}_{P/F} = \dfrac{u^2}{r} \leftarrow$

Coriolis acceleration $\mathbf{a}_C$.

For each pin $a_C = 2\omega u$ with $\mathbf{a}_C$ in a direction obtained by rotating $\mathbf{u}$ through $90°$ in the sense of $\boldsymbol{\omega}$, i.e., ⤺.

Then $\mathbf{a}_1 = [r\omega^2 \rightarrow] + [2\omega u \downarrow]$ $\qquad \mathbf{a}_1 = r\omega^2\mathbf{i} - 2\omega u\mathbf{j}$ ◀

$\mathbf{a}_2 = [r\omega^2 \downarrow] + [2\omega u \rightarrow]$ $\qquad \mathbf{a}_2 = 2\omega u\mathbf{i} - r\omega^2\mathbf{j}$ ◀

$\mathbf{a}_3 = [r\omega^2 \leftarrow] + \left[\dfrac{u^2}{r} \leftarrow\right] + [2\omega u \leftarrow]$ $\qquad \mathbf{a}_3 = -\left(r\omega^2 + \dfrac{u^2}{r} + 2\omega u\right)\mathbf{i}$ ◀

$\mathbf{a}_4 = [r\omega^2 \uparrow] + [2\omega u \uparrow]$ $\qquad \mathbf{a}_4 = (r\omega^2 + 2\omega u)\mathbf{j}$ ◀

PROBLEM 15.165

At the instant shown the length of the boom AB is being *increased* at the constant rate of 0.2 m/s and the boom is being lowered at the constant rate of 0.08 rad/s. Determine (*a*) the velocity of Point B, (*b*) the acceleration of Point B.

SOLUTION

Velocity of coinciding Point B′ on boom.

$$\mathbf{v}_{B'} = r\omega = (6)(0.08) = 0.48 \text{ m/s} \searrow 60°$$

Velocity of Point B relative to the boom.

$$\mathbf{v}_{B/\text{boom}} = 0.2 \text{ m/s} \nearrow 30°$$

(*a*) *Velocity of Point B.*

$$\mathbf{v}_B = \mathbf{v}_{B'} + \mathbf{v}_{B/\text{boom}}$$

$$\xrightarrow{+}: \quad (v_B)_x = 0.48 \cos 60° + 0.2 \cos 30° = 0.4132 \text{ m/s}$$

$$+\uparrow: \quad (v_B)_y = -0.48 \sin 60° + 0.2 \sin 30° = -0.3157 \text{ m/s}$$

$$v_B = \sqrt{(0.4132)^2 + (0.3157)^2}$$

$$= 0.520 \text{ m/s}$$

$$\tan\beta = -\frac{0.3157}{0.4132}, \quad \beta = -37.4°$$

$$\mathbf{v}_B = 0.520 \text{ m/s} \searrow 37.4° \blacktriangleleft$$

Acceleration of coinciding Point B′ on boom.

$$\mathbf{a}_{B'} = r\omega^2 = (6)(0.08)^2 = 0.0384 \text{ m/s}^2 \swarrow 30°$$

Acceleration of B relative to the boom.

$$\mathbf{a}_{B/\text{boom}} = 0$$

Coriolis acceleration.

$$2\omega u = (2)(0.08)(2) = 0.032 \text{ m/s}^2 \searrow 60°$$

PROBLEM 15.166

The sleeve BC is welded to an arm that rotates about A with a constant angular velocity ω. In the position shown rod DF is being moved to the left at a constant speed $u = 400$ mm/s relative to the sleeve. For the given angular velocity ω, determine the acceleration (*a*) of Point D, (*b*) of the point of rod DF that coincides with Point E.

$\omega = (3 \text{ rad/s})\mathbf{i}$.

SOLUTION

(*a*) Point D.

$$\mathbf{v}_{D/F} = \mathbf{v}_{D/BC} = (0.4 \text{ m/s})\mathbf{k}; \quad a_{D/F} = 0$$

$$\overrightarrow{AD} = -(0.12 \text{ m})\mathbf{j} + (0.3 \text{ m})\mathbf{k}$$

$$\mathbf{a}_{D'} = \boldsymbol{\omega} \times (\omega \times \overrightarrow{AD})$$

$$= -\omega^2(\overline{AD})$$

$$= -(3 \text{ rad/s})^2 \overline{AD}$$

$$= +(1.08 \text{ m/s}^2)\mathbf{j} - (2.70 \text{ m/s}^2)\mathbf{k}$$

$$\mathbf{a}_c = 2\boldsymbol{\omega} \times \mathbf{v}_{D/F}$$

$$= 2[(3 \text{ rad/s})\mathbf{i}] \times (0.40 \text{ m/s})\mathbf{k}$$

$$= -(2.4 \text{ m/s}^2)\mathbf{j}$$

$$\mathbf{a}_D = \mathbf{a}_{D'} + \mathbf{a}_{D/F} + \mathbf{a}_c$$

$$= [+(1.08 \text{ m/s}^2)\mathbf{j} - (2.70 \text{ m/s}^2)\mathbf{k}] + 0 + [-(2.4 \text{ m/s})\mathbf{j}]$$

$$\mathbf{a}_D = -(1.32 \text{ m/s})\mathbf{j} - (2.70 \text{ m/s})\mathbf{k} \blacktriangleleft$$

(*b*) Point P of DF that coincides with E.

$$\mathbf{v}_{P/F} = \mathbf{v}_{P/BC} = (0.40 \text{ m/s})\mathbf{k}; \quad \mathbf{a}_{P/F} = 0$$

$$\overrightarrow{AE} = -(0.120 \text{ m})\mathbf{j}$$

$$\mathbf{a}_{P'} = \boldsymbol{\omega} \times (\boldsymbol{\omega} \times \overrightarrow{AE}) = -\omega^2 AE = -(3 \text{ rad/s})^2 AE = (1.08 \text{ m/s}^2)\mathbf{j}$$

$$\mathbf{a}_c = 2\boldsymbol{\omega} \times \mathbf{v}_{P/F}$$

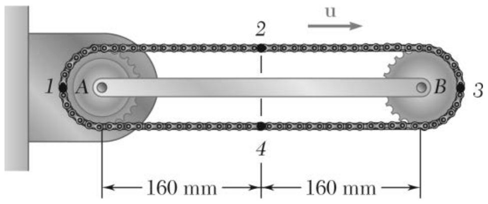
PROBLEM 15.168



A chain is looped around two gears of radius 40 mm that can rotate freely with respect to the 320-mm arm *AB*. The chain moves about arm *AB* in a clockwise direction at the constant rate of 80 mm/s relative to the arm. Knowing that in the position shown arm *AB* rotates clockwise about *A* at the constant rate $\omega = 0.75$ rad/s, determine the acceleration of each of the chain links indicated.

Links 1 and 2.

SOLUTION

Let the arm *AB* be a rotating frame of reference. $\Omega = 0.75 \text{ rad/s} \circlearrowright = -(0.75 \text{ rad/s})\mathbf{k}$:

Link 1:

$$\mathbf{r}_1 = -(40 \text{ mm})\mathbf{i}, \quad \mathbf{v}_{1/AB} = u \uparrow = (80 \text{ mm/s})\mathbf{j}$$

$$\mathbf{a}'_1 = -\Omega^2\mathbf{r}_1 = -(0.75)^2(-40) = (22.5 \text{ mm/s})\mathbf{i}$$

$$\mathbf{a}_{1/AB} = \frac{u^2}{\rho} = \frac{80^2}{40} 160 \text{ mm/s} \rightarrow = (160 \text{ mm/s}^2)\mathbf{i}$$

$$2\Omega \times \mathbf{v}_{P/AB} = (2)(-0.75\mathbf{k}) \times (80\mathbf{j})$$

$$= (120 \text{ mm/s})\mathbf{i}$$

$$\mathbf{a}_1 = \mathbf{a}'_1 + \mathbf{a}_{1/AB} + 2\Omega \times \mathbf{v}_{1/AB}$$

$$= (302.5 \text{ mm/s}^2)\mathbf{i}$$

$$\mathbf{a}_1 = 303 \text{ mm/s}^2 \longrightarrow \blacktriangleleft$$

Link 2:

$$\mathbf{r}_2 = (160 \text{ mm})\mathbf{i} + (40 \text{ mm})\mathbf{j}$$

$$\mathbf{v}_{2/AB} = u \rightarrow = (80 \text{ mm/s})\mathbf{i}$$

$$\mathbf{a}'_2 = -\Omega^2\mathbf{r}_2$$

$$= -(0.75)^2(160\mathbf{i} + 40\mathbf{j})$$

$$= -(90 \text{ mm/s}^2)\mathbf{i} - (22.5 \text{ mm/s}^2)\mathbf{j}$$

$$\mathbf{a}_{2/AB} = 0$$

$$2\Omega \times \mathbf{v}_{2/AB} = (2)(-0.75\mathbf{k}) \times (80\mathbf{i})$$

$$= -(120 \text{ mm/s}^2)\mathbf{j}$$

$$\mathbf{a}^2 = \mathbf{a}'_2 + \mathbf{a}_{2/AB} + 2\Omega \times \mathbf{v}_{2/AB}$$

$$= -90\mathbf{i} - 22.5\mathbf{j} - 120\mathbf{j}$$

$$= -(90 \text{ mm/s}^2)\mathbf{i} - (142.5 \text{ mm/s}^2)\mathbf{j}$$

$$\mathbf{a}_2 = \sqrt{(90)^2 + (142.5)^2}$$

$$= 168.5 \text{ mm/s}^2$$

$$\tan\beta = \frac{142.5}{90}, \quad \beta = 57.7°$$

$$\mathbf{a}_2 = 168.5 \text{ mm/s}^2 \swarrow 57.7° \blacktriangleleft$$

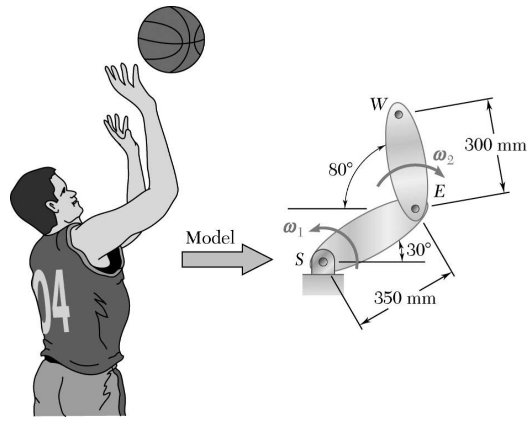
PROBLEM 15.170



A basketball player shoots a free throw in such a way that his shoulder can be considered a pin joint at the moment of release as shown. Knowing that at the instant shown the upper arm *SE* has a constant angular velocity of 2 rad/s counterclockwise and the forearm *EW* has a constant clockwise angular velocity of 4 rad/s with respect to *SE*, determine the velocity and acceleration of the wrist *W*.

SOLUTION

Units: meters, m/s, m/s^2

Unit vectors: $\mathbf{i} = 1 \longrightarrow, \quad \mathbf{j} = 1 \uparrow, \quad \mathbf{k} = 1 \circlearrowleft$

Relative positions:

$$\mathbf{r}_{E/S} = (0.35\cos 30°)\mathbf{i} + (0.35\sin 30°)\mathbf{j} = 0.30311\mathbf{i} + 0.175\mathbf{j}$$

$$\mathbf{r}_{W/E} = -(0.3\cos 80°)\mathbf{i} + (0.3\sin 80°)\mathbf{j} = -0.05209\mathbf{i} + 0.29544\mathbf{j}$$

$$\mathbf{r}_{W/S} = \mathbf{r}_{E/S} + \mathbf{r}_{W/E} = 0.25101\mathbf{i} + 0.47044\mathbf{j}$$

Use a frame of reference rotating with the upper arm *SE* with angular velocity

$$\mathbf{\Omega} = (2\text{ rad/s})\mathbf{k} \quad (\dot{\mathbf{\Omega}} = 0)$$

The motion of the wrist *W* relative to this frame is a rotation about the elbow *E* with angular velocity

$$\boldsymbol{\omega} = -(4\text{ rad/s})\mathbf{k} \quad (\dot{\boldsymbol{\omega}} = 0)$$

Motion of Point *W′* in the frame coinciding with *W*.

$$\mathbf{v}_{W'} = \mathbf{\Omega} \times \mathbf{r}_{W/S} = (2\mathbf{k}) \times (0.25101\mathbf{i} + 0.47044\mathbf{j})$$
$$= -0.94088\mathbf{i} + 0.50204\mathbf{j}$$

$$\mathbf{a}_{W'} = -\Omega^2 \mathbf{r}_{W/S} = -(2)^2(0.25101\mathbf{i} + 0.47044\mathbf{j})$$
$$= -1.00408\mathbf{i} - 1.88176\mathbf{j}$$

Motion of *W* relative to the frame.

$$\mathbf{v}_{W/SE} = \boldsymbol{\omega} \times \mathbf{r}_{W/E} = (-4\mathbf{k}) \times (-0.05210\mathbf{i} + 0.29544\mathbf{j})$$
$$= 1.18176\mathbf{i} + 0.2084\mathbf{j}$$

$$\mathbf{a}_{W/SE} = -\omega^2 \mathbf{r}_{W/E} = -(4)^2(-0.05210\mathbf{i} + 0.29544\mathbf{j})$$
$$= 0.8336\mathbf{i} - 4.72708\mathbf{j}$$

Velocity of *W*: $\mathbf{v}_W = \mathbf{v}_{W'} + \mathbf{v}_{W/SE} = 0.24088\mathbf{i} + 0.71044\mathbf{j}$

$$\mathbf{v}_W = 0.750\text{ m/s} \measuredangle 71.3° \blacktriangleleft$$

PROBLEM 15.171

The human leg can be crudely approximated as two rigid bars (the femur and the tibia) connected with a pin joint. At the instant shown the veolcity and acceleration of the ankle is zero. During a jump, the velocity of the ankle *A* is zero, the tibia *AK* has an angular velocity of 1.5 rad/s counterclockwise and an angular acceleration of 1 rad/s^2 counterclockwise. Determine the relative angular velocity and angular acceleration of the femur *KH* with respect to *AK* so that the velocity and acceleration of *H* are both straight up at the instant shown.

SOLUTION

Units: inches, in./s, in./s^2

Unit vectors: $\mathbf{i} = 1 \longrightarrow, \quad \mathbf{j} = 1 \uparrow, \quad \mathbf{k} = 1 \circlearrowleft$

Relative positions:
$$\mathbf{r}_{K/A} = (12 \text{ in.})\mathbf{i} + (12 \text{ in.})\mathbf{j}$$
$$\mathbf{r}_{H/K} = -(14 \text{ in.})\mathbf{i} + (14 \text{ in.})\mathbf{j}$$
$$\mathbf{r}_{H/A} = \mathbf{r}_{K/A} + \mathbf{r}_{H/K} = -(2 \text{ in.})\mathbf{i} + (26 \text{ in.})\mathbf{j}$$

Use a frame of reference moving with the lower leg *AK* with angular velocity
$$\mathbf{\Omega} = 1.5 \text{ rad/s} \circlearrowleft = (1.5 \text{ rad/s})\mathbf{k}$$

and angular acceleration
$$\dot{\mathbf{\Omega}} = 1.0 \text{ rad/s} \circlearrowleft = (1.0 \text{ rad/s}^2)\mathbf{k}$$

The motion of the hip *H* relative to this frame is a rotation about the knee *K* with angular velocity
$$\boldsymbol{\omega} = \omega\mathbf{k}$$

and angular acceleration
$$\boldsymbol{\alpha} = \alpha\mathbf{k}$$

Both $\boldsymbol{\omega}$ and $\boldsymbol{\alpha}$ are measured relative to the lower leg *AK*.

Motion of Point H' in the frame coinciding with *H*.
$$\mathbf{v}_{H'} = \mathbf{\Omega} \times \mathbf{r}_{H/A} = 1.5\mathbf{k} \times (-2\mathbf{i} + 26\mathbf{j})$$
$$= -(39 \text{ in./s})\mathbf{i} - (3 \text{ in./s})\mathbf{j}$$
$$\mathbf{a}_{H'} = \dot{\mathbf{\Omega}} \times \mathbf{r}_{H/A} - \Omega^2 \mathbf{r}_{H/A}$$
$$= (1.0\mathbf{k}) \times (-2\mathbf{i} + 26\mathbf{j}) - (1.5)^2(-2\mathbf{i} + 26\mathbf{j})$$
$$= -26\mathbf{i} - 2\mathbf{j} + 4.5\mathbf{i} - 58.5\mathbf{j}$$
$$= -(21.5 \text{ in./s}^2)\mathbf{i} - (60.5 \text{ in./s}^2)\mathbf{j}$$

Motion of H relative to the frame.

$$\mathbf{v}_{H/AK} = \omega\mathbf{k}\times\mathbf{r}_{H/K} = \omega\mathbf{k}\times(-14\mathbf{i}+14\mathbf{j})$$
$$= -14\omega\mathbf{i} - 14\omega\mathbf{j}$$
$$\mathbf{a}_{H/AK} = \alpha\mathbf{k}\times\mathbf{r}_{H/K} - \omega^2\mathbf{r}_{H/K}$$
$$= \alpha\mathbf{k}\times(-14\mathbf{i}+14\mathbf{j}) - \omega^2(-14\mathbf{i}+14\mathbf{j})$$
$$= -14\alpha\mathbf{i} - 14\alpha\mathbf{j} + 14\omega^2\mathbf{i} - 14\omega^2\mathbf{j}$$

Velocity of H.

$$\mathbf{v}_H = \mathbf{v}_H \uparrow = \mathbf{v}_H\mathbf{j}$$
$$\mathbf{v}_H = \mathbf{v}_{H'} + \mathbf{v}_{H/AK}$$
$$v_H\mathbf{j} = -39\mathbf{i} - 3\mathbf{j} - 14\omega\mathbf{i} - 14\omega\mathbf{j}$$

Resolve into components.

i: $\quad 0 = -39 - 14\omega \qquad \omega = -\dfrac{39}{14} = -2.7857 \text{ rad/s}$

j: $\quad v_H = -3 - 14\omega \qquad v_H = -36 \text{ in./s}$

Relative angular velocity: $\boldsymbol{\omega} = -(2.79 \text{ rad/s})\mathbf{k} = 2.79 \text{ rad/s} \circlearrowright$ ◀

Coriolis acceleration:
$$2\boldsymbol{\Omega}\times\mathbf{v}_{H/AK} = (2)(1.5\mathbf{k})\times(-14\omega\mathbf{i} - 14\omega\mathbf{j})$$
$$= 42\omega\mathbf{i} - 42\omega\mathbf{j} = -(117 \text{ in./s}^2)\mathbf{i} + (117 \text{ in./s}^2)\mathbf{j}$$

Acceleration of H.

$$\mathbf{a}_H = a_H \uparrow = a_H\mathbf{j}$$
$$\mathbf{a}_H = \mathbf{a}_{H'} + \mathbf{a}_{H/AK} + 2\boldsymbol{\Omega}\times\mathbf{v}_{H/AK}$$
$$a_H\mathbf{j} = -21.5\mathbf{i} - 60.5\mathbf{j} - 14\alpha\mathbf{i} - 14\alpha\mathbf{j} + 14\omega^2\mathbf{i} - 14\omega^2\mathbf{j} - 117\mathbf{i} + 117\mathbf{j}$$

Resolve into components.

i: $\quad 0 = -21.5 - 14\alpha + (14)(-2.7857)^2 - 117$

$$\alpha = -2.1327 \text{ rad/s}^2$$

j: $\quad a_H = -60.5 - (14)(-2.1327) - (14)(-2.7857)^2 + 117$

$$= -22.284 \text{ in./s}^2$$

Relative angular acceleration: $\boldsymbol{\alpha} = -(2.13 \text{ rad/s}^2)\mathbf{k} = 2.13 \text{ rad/s}^2 \circlearrowright$ ◀

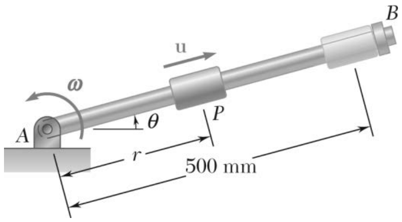
PROBLEM 15.172



The collar P slides outward at a constant relative speed u along rod AB, which rotates counterclockwise with a constant angular velocity of 20 rpm. Knowing that $r = 250$ mm when $\theta = 0$ and that the collar reaches B when $\theta = 90°$, determine the magnitude of the acceleration of the collar P just as it reaches B.

SOLUTION

$$\omega = 20 \text{ rpm} = \frac{(20)(2\pi)}{60} = \frac{2\pi}{3} \text{ rad/s}$$

$$\alpha = 0$$

$$\theta = 90° = \frac{\pi}{2} \text{ radians}$$

Uniform rotational motion. $\theta = \theta_0 + \omega t$

$$t = \frac{\theta - \theta_0}{\omega} = \frac{\frac{\pi}{2}}{\frac{2\pi}{3}} = 0.75 \text{ s}$$

Uniform motion along rod. $r = r_0 + ut$

$$u = \frac{r - r_0}{t} = \frac{0.5 - 0.25}{0.75} = \frac{1}{3} \text{ m/s},$$

$$\mathbf{v}_{P/AB} = \frac{1}{3} \text{ m/s} \uparrow$$

Acceleration of coinciding Point P′ on the rod. $(r = 0.5 \text{ m})$

$$\mathbf{a}_{P'} = r\omega^2$$

$$= (0.5)\left(\frac{2\pi}{3}\right)^2$$

$$= \frac{2\pi^2}{9} \text{ m/s}^2 \downarrow$$

$$= 2.1932 \text{ m/s}^2 \downarrow$$

Acceleration of collar P relative to the rod. $\mathbf{a}_{P/AB} = 0$

Coriolis acceleration. $2\boldsymbol{\omega} \times \mathbf{v}_{P/AB} = 2\omega u = (2)\left(\frac{2\pi}{3}\right)\left(\frac{1}{3}\right) = 1.3963 \text{ m/s}^2 \longleftarrow$

Acceleration of collar P. $\mathbf{a}_P = \mathbf{a}_{P'} + \mathbf{a}_{P/AB} + 2\boldsymbol{\omega} \times \mathbf{v}_{P/AB}$

$$\mathbf{a}_P = [2.1932 \text{ m/s}^2 \downarrow] + [1.3963 \text{ m/s}^2 \longleftarrow]$$

$$\mathbf{a}_P = 2.60 \text{ m/s}^2 \swarrow 57.5°$$

$a_P = 2.60 \text{ m/s}^2$ ◀

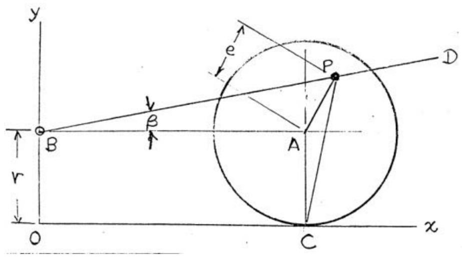
PROBLEM 15.175

Pin P is attached to the wheel shown and slides in a slot cut in bar BD. The wheel rolls to the right without slipping with a constant angular velocity of 20 rad/s. Knowing that $x = 480$ mm when $\theta = 0$, determine (*a*) the angular acceleration of the bar and (*b*) the relative acceleration of pin P with respect to the bar when $\theta = 0$.

SOLUTION

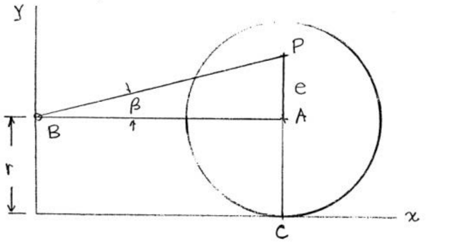
Coordinates.



$$x_A = (x_A)_0 + r\theta, \qquad y_A = r$$
$$x_B = 0, \qquad y_B = r$$
$$x_C = x_A, \qquad y_C = 0$$
$$x_P = x_A + e\sin\theta, \qquad y_P = r + e\cos\theta$$

Data:

$$(x_A)_0 = 480 \text{ mm} = 0.48 \text{ m}$$
$$r = 200 \text{ mm} = 0.20 \text{ m}$$
$$e = 140 \text{ mm} = 0.14 \text{ m}$$
$$\theta = 0 \qquad x_P = 480 \text{ mm} = 0.48 \text{ m}$$



Velocity analysis.

$$\boldsymbol{\omega}_{AC} = 20 \text{ rad/s} \circlearrowright, \qquad \boldsymbol{\omega}_{BD} = \omega_{BD} \circlearrowright$$

$$\mathbf{v}_P = (r+e)\omega_{AC} \longrightarrow$$
$$= (0.20 + 0.14)(20)$$
$$= 6.8 \text{ m/s} \longrightarrow$$

$$\mathbf{v}_{P'} = [x_P\omega_{BD} \downarrow] + [e\omega_{BD} \longrightarrow]$$

$$\mathbf{v}_{P/F} = [u\cos\beta \longrightarrow] + [u\sin\beta \uparrow]$$

$$\tan\beta = \frac{e}{x_P} = \frac{0.14}{0.48}$$
$$\beta = 16.260°$$

Use $\mathbf{v}_P = \mathbf{v}_{P'} + \mathbf{v}_{P/F}$ and resolve into components.

$$\xrightarrow{+}: \quad 6.8 = 0.14\omega_{BD} + u\cos\beta \tag{1}$$

$$+\downarrow: \quad 0 = 0.48\omega_{BD} - u\sin\beta \tag{2}$$

Solving (1) and (2), $\omega_{BD} = 3.8080$ rad/s, $u = 6.528$ m/s

$$= \alpha_{BP}\mathbf{k} \times (0.11233\mathbf{i} + 0.04088\mathbf{j}) - \omega_{BP}^2(0.11233\mathbf{i} + 0.04088\mathbf{j})$$
$$= -0.04088\alpha_{BP}\mathbf{i} + 0.11233\alpha_{BP}\mathbf{j} - 0.11233\omega_{BP}^2\mathbf{i} - 0.04088\omega_{BP}^2\mathbf{j}$$

Velocity of *P*: $\mathbf{v}_P = \mathbf{v}_{P'} + \mathbf{v}_{\text{rel}}$

Resolve into components.

i: $-1.2044 = -0.04088\omega_{BP} + u\cos 20°$

j: $0.56165 = 0.11233\omega_{BP} + u\sin 20°$

Solving the simultaneous equations for ω_{BP} and u,

$$\omega_{BP} = 7.8612 \text{ rad/s} \qquad u = -0.93971 \text{ m/s}$$

Angular velocity of BP: $\boldsymbol{\omega}_{BP} = 7.86 \text{ rad/s} \circlearrowleft$ ◄

Relative velocity: $\mathbf{v}_{\text{rel}} = -0.93971(\cos 20°\mathbf{i} + \sin 20°\mathbf{j})$

Coriolis acceleration:

$$2\boldsymbol{\omega}_{BP} \times \mathbf{v}_{\text{rel}} = (2)(7.8612\mathbf{k}) \times (-0.93971\cos 20°\mathbf{i} - 0.93971\sin 20°\mathbf{j})$$
$$= (5.0532 \text{ m/s}^2)\mathbf{i} - (13.8835 \text{ m/s}^2)\mathbf{j}$$

Acceleration of *P*: $\mathbf{a}_{P'} = \mathbf{a}_{P'} + \mathbf{a}_{\text{rel}} + 2\boldsymbol{\omega}_{BP} \times \mathbf{v}_{\text{rel}}$

Resolve into components.

i: $-2.3265 = -0.04088\alpha_{BP} - 0.11233\omega_{BP}^2 + \dot{u}\cos 20° + 5.0532$

$$-0.04088\alpha_{BP} + \dot{u}\cos 20° = -0.43788 \qquad (1)$$

j: $-6.2467 = 0.11233\alpha_{BP} - 0.04088\omega_{BP}^2 + \dot{u}\sin 20° - 13.8835$

$$0.11233\alpha_{BP} + \dot{u}\sin 20° = 10.1631 \qquad (2)$$

Solving Eqs. (1) and (2) simultaneously,

$$\alpha_{BP} = 81.146 \text{ rad/s}^2 \quad \dot{u} = 3.0641 \text{ m/s}^2$$

Angular acceleration of BP: $\boldsymbol{\alpha}_{BP} = 81.1 \text{ rad/s}^2 \circlearrowleft$ ◄

PROBLEM 15.177

The Geneva mechanism shown is used to provide an intermittent rotary motion of disk S. Disk D rotates with a constant counterclockwise angular velocity ω_D of 8 rad/s. A pin P is attached to disk D and can slide in one of the six equally spaced slots cut in disk S. It is desirable that the angular velocity of disk S be zero as the pin enters and leaves each of the six slots; this will occur if the distance between the centers of the disks and the radii of the disks are related as shown. Determine the angular velocity and angular acceleration of disk S at the instant when $\phi = 150°$.

SOLUTION

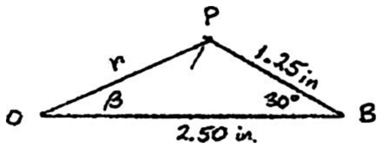
Geometry:

Law of cosines. $\quad r^2 = 1.25^2 + 2.50^2 - (2)(1.25)(2.50)\cos 30°$

$$r = 1.54914 \text{ in.}$$

Law of sines. $\quad \dfrac{\sin\beta}{1.25} = \dfrac{\sin 30°}{r}$

$$\beta = 23.794°$$



Let disk S be a rotating frame of reference.

$$\mathbf{\Omega} = \omega_S \circlearrowright, \quad \dot{\mathbf{\Omega}} = \alpha_S \circlearrowright$$

Motion of coinciding Point P′ on the disk.

$$\mathbf{v}_{P'} = r\omega_S = 1.54914\omega_S \searrow \beta$$

$$\mathbf{a}_{P'} = -\alpha_S \mathrm{k} \times \mathrm{r}_{P/O} - \omega_S^2 \mathrm{r}_{P/O} = [1.54914\alpha_S \searrow \beta] + [1.54914\omega_S^2 \swarrow \beta]$$

Motion relative to the frame.

$$\mathbf{v}_{P/S} = u \swarrow \beta \quad \mathrm{a}_{P/S} = \dot{u} \swarrow \beta$$

Coriolis acceleration. $\quad 2\omega_S u \searrow \beta$

$$\mathbf{v}_P = \mathbf{v}_{P'} + \mathbf{v}_{P/S} = [1.54914\omega_S \searrow \beta] + [u \swarrow \beta]$$

$$\mathbf{a}_P = \mathbf{a}_P + \mathbf{a}_{P/S} + 2\omega_S u \searrow$$

$$= [1.54914\alpha_S \searrow \beta] + [1.54914\omega_S^2 \swarrow \beta] + [\dot{u} \swarrow \beta] + [2\omega_S u \searrow \beta]$$

Motion of disk D. (Rotation about B)

$$\mathbf{v}_P = (BP)\omega_D = (1.25)(8) = 10 \text{ in./s} \swarrow 30°$$

$$\mathbf{a}_P = [(BP)\alpha_D \swarrow 60°] + [(BP)\omega_S^2 \searrow 30°] = 0 + [(1.25)(8)^2 \searrow 30°]$$

$$= 80 \text{ in./s}^2 \searrow 30°$$

PROBLEM 15.179

At the instant shown, bar *BC* has an angular velocity of 3 rad/s and an angular acceleration of 2 rad/s^2, both counterclockwise. Determine the angular acceleration of the plate.

SOLUTION

Relative position vectors.

$$\mathbf{r}_{B/D} = (4\text{ in.})\mathbf{i} + (3\text{ in.})\mathbf{j}$$

$$\mathbf{r}_{B/C} = -(6\text{ in.})\mathbf{i} + (3\text{ in.})\mathbf{j}$$

Velocity analysis.

$$\boldsymbol{\omega}_{BC} = 3\text{ rad/s} \circlearrowleft$$

Bar *BC* (Rotation about *C*):

$$\boldsymbol{\omega}_{BC} = (3\text{ rad/s})\mathbf{k}$$

$$\mathbf{v}_B = \boldsymbol{\omega}_{BC} \times \mathbf{r}_{B/C} = 3\mathbf{k} \times (-6\mathbf{i} + 3\mathbf{j})$$

$$= -(9\text{ in./s})\mathbf{i} - (18\text{ in./s})\mathbf{j}$$

Plate (Rotation about *D*):

$$\omega_P = \omega_P \mathbf{k}$$

Let Point B' be the point in the plate coinciding with *B*.

$$\mathbf{v}_{B'} = \boldsymbol{\omega}_P \times \mathbf{r}_{B/D} = \omega_P \mathbf{k} \times (4\mathbf{i} + 3\mathbf{j})$$

$$= -3\omega_P \mathbf{i} + 4\omega_P \mathbf{j}$$

Let plate be a rotating frame.

$$\mathbf{v}_{B/F} = v_{\text{rel}}\mathbf{j}$$

$$\mathbf{v}_B = \mathbf{v}_{B'} + \mathbf{v}_{B/F}$$

$$= -3\omega_P \mathbf{i} + (4\omega_P + v_{\text{rel}})\mathbf{j}$$

Equate like components of $\mathbf{v}_B$.

$$\mathbf{i}: \quad -9 = -3\omega_P \qquad \boldsymbol{\omega}_P = (3\text{ rad/s})\mathbf{k}$$

$$\mathbf{j}: \quad -18 = (4)(3) + v_{\text{rel}} \qquad \mathbf{v}_{\text{rel}} = -(30\text{ in./s})\mathbf{j}$$

Acceleration analysis.

$$\boldsymbol{\alpha}_{BC} = 2\text{ rad/s}^2 \circlearrowleft$$

Bar *BC*:

$$\boldsymbol{\alpha}_{BC} = (2\text{ rad/s}^2)\mathbf{k}$$

$$\mathbf{a}_B = \boldsymbol{\alpha}_{BC} \times \mathbf{r}_{B/C} - \omega_{BC}^2\,\mathbf{r}_{B/C}$$

$$= 2\mathbf{k} \times (-6\mathbf{i} + 3\mathbf{j}) - (3)^2(-6\mathbf{i} + 3\mathbf{j})$$

$$= -12\mathbf{j} - 6\mathbf{i} + 54\mathbf{i} - 27\mathbf{j} = (48\text{ in./s}^2)\mathbf{i} - (39\text{ in./s}^2)\mathbf{j}$$

Plate:

$$\boldsymbol{\alpha}_P = \alpha_P \mathbf{k}$$

$$\mathbf{a}_{B'} = \boldsymbol{\alpha}_P \times \mathbf{r}_{B/D} - \omega_P^2\,\mathbf{r}_{B/D}$$

$$= \alpha_P \mathbf{k} \times (4\mathbf{i} + 3\mathbf{j}) - (3)^2(4\mathbf{i} + 3\mathbf{j})$$

$$= -3\alpha_P \mathbf{i} + 4\alpha_P \mathbf{j} - 36\mathbf{i} - 27\mathbf{j}$$

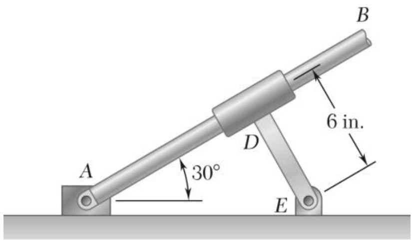
PROBLEM 15.181*



Rod *AB* passes through a collar which is welded to link *DE*. Knowing that at the instant shown block *A* moves to the right at a constant speed of 75 in./s, determine (*a*) the angular velocity of rod *AB*, (*b*) the velocity relative to the collar of the point of the rod in contact with the collar, (*c*) the acceleration of the point of the rod in contact with the collar. (*Hint:* Rod *AB* and link *DE* have the same $\boldsymbol{\omega}$ and the same $\boldsymbol{\alpha}$.)

SOLUTION

Let $\boldsymbol{\omega} = \omega \circlearrowleft$ and $\boldsymbol{\alpha} = \alpha \circlearrowleft$ be the angular velocity and angular acceleration of the link *DE* and collar rigid body. Let *F* be a frame of reference moving with this body. The rod *AB* slides in the collar relative to the frame of reference with relative velocity $\mathbf{u} = u \angle 30°$ and relative acceleration $\dot{\mathbf{u}} = \dot{u} \angle 30°$. Note that this relative motion is a translation that applies to all points along the rod. Let Point *A* be moving with the end of the rod and A' be moving with the frame. Point *E* is a fixed point.

Geometry. $\qquad \mathbf{r}_{A'/E} = \dfrac{6 \text{ in.}}{\sin 30°} = 12 \text{ in.} \longleftarrow$

Velocity analysis. $\qquad \mathbf{v}_A = 75 \text{ in./s} \longrightarrow$

$$\mathbf{v}_{A'} = 12\omega \downarrow$$

$\mathbf{v}_A = \mathbf{v}_{A'} + \mathbf{u}$ Resolve into components.

$$\xrightarrow{+}: \quad 75 = 0 + u\cos 30° \quad u = \frac{75}{\cos 30°} = 86.603 \text{ in./s}$$

$$+\uparrow: \quad 0 = -12\omega + u\sin 30° \quad \omega = \frac{u\sin 30°}{12} = 3.6085 \text{ rad/s}$$

(*a*) Angular velocity. $\qquad \boldsymbol{\omega} = 3.61 \text{ rad/s} \circlearrowleft$ ◀

(*b*) Velocity of rod *AB* relative to the collar. $\qquad \mathbf{u} = 86.6 \text{ in./s} \angle 30°$ ◀

(*c*) Acceleration analysis. $\qquad \mathbf{a}_A = 0$

$$\mathbf{a}_{A'} = [12\alpha \downarrow] + [12\omega^2 \longrightarrow] = [12\alpha \downarrow] + [156.25 \longrightarrow]$$

Coriolis acceleration.

$$\mathbf{a}_c = 2\omega u \searrow 60° = 625.01 \text{ in./s}^2 \searrow 60°$$

$\mathbf{a}_A = \mathbf{a}_{A'} + \dot{\mathbf{u}} + \mathbf{a}_c$ Resolve into components.

$$\xrightarrow{+}: \quad 0 = 156.25 + \dot{u}\cos 30° - 625.01\cos 60°$$

$$\dot{u} = 180.43 \text{ in./s}^2$$

$$+\uparrow: \quad 0 = -12\alpha + \dot{u}\sin 30° + 625.01\sin 60°$$

$$\alpha = 52.624 \text{ rad/s}^2$$

PROBLEM 15.182*

Solve Problem 15.181, assuming that block A moves to the left at a constant speed of 75 in./s.

PROBLEM 15.181 Rod AB passes through a collar which is welded to link DE. Knowing that at the instant shown block A moves to the right at a constant speed of 75 in./s, determine (*a*) the angular velocity of rod AB, (*b*) the velocity relative to the collar of the point of the rod in contact with the collar, (*c*) the acceleration of the point of the rod in contact with the collar. (*Hint:* Rod AB and link DE have the same $\boldsymbol{\omega}$ and the same $\boldsymbol{\alpha}$.)

SOLUTION

Let $\boldsymbol{\omega} = \omega \circlearrowleft$ and $\boldsymbol{\alpha} = \alpha \circlearrowleft$ be the angular velocity and angular acceleration of the link DE and collar rigid body. Let F be a frame of reference moving with this body. The rod AB slides in the collar relative to the frame of reference with relative velocity $\mathbf{u} = u \measuredangle 30°$ and relative acceleration $\dot{\mathbf{u}} = \dot{u} \measuredangle 30°$. Note that this relative motion is a translation that applies to all points along the rod. Let Point A be moving with the end of the rod and A' be moving with the frame. Point E is a fixed point.

Geometry. $$\mathbf{r}_{A'/E} = \frac{6 \text{ in.}}{\sin 30°} = 12 \text{ in.} \longleftarrow$$

Velocity analysis. $$\mathbf{v}_A = 75 \text{ in./s} \longleftarrow$$

$$\mathbf{v}_{A'} = 12\omega \downarrow$$

$$\mathbf{v}_A = \mathbf{v}_{A'} + \mathbf{u} \quad \text{Resolve into components.}$$

$$\xrightarrow{+}: \quad -75 = 0 + u\cos 30° \quad u = \frac{75}{\cos 30°} = -86.603 \text{ in./s}$$

$$+\uparrow: \quad 0 = -12\omega + u\sin 30° \quad \omega = \frac{u \sin 30°}{12} = -3.6085 \text{ rad/s}$$

(*a*) Angular velocity. $\boldsymbol{\omega} = 3.61 \text{ rad/s} \circlearrowright$ ◀

(*b*) Velocity of rod AB relative to the collar. $\mathbf{u} = 86.6 \text{ in./s} \measuredangle 30°$ ◀

Acceleration analysis. $$\mathbf{a}_A = 0$$

$$\mathbf{a}_{A'} = [12\alpha \downarrow] + [12\omega^2 \longrightarrow] = [12\alpha \downarrow] + [156.25 \longrightarrow]$$

Coriolis acceleration. $$\mathbf{a}_c = 2\omega u \searrow 60° = 625.01 \text{ in./s}^2 \searrow 60°$$

$$\mathbf{a}_A = \tilde{\mathbf{a}}_{A'} + \dot{\mathbf{u}} + \mathbf{a}_c \quad \text{Resolve into components.}$$

$$\xrightarrow{+}: \quad 0 = 156.25 + \dot{u}\cos 30° - 625.01\cos 60°$$

$$\dot{u} = 180.43 \text{ in./s}^2$$

$$+\uparrow: \quad 0 = -12\alpha + \dot{u}\sin 30° + 625.01\sin 60°$$

$$\alpha = 52.624 \text{ rad/s}^2$$

PROBLEM 15.182* (Continued)

For rod AB, $\omega_{AB} = 3.6085 \text{ rad/s} \circlearrowleft$

$$\alpha_{AB} = 52.624 \text{ rad/s}^2 \circlearrowleft$$

Let P be the point on AB coinciding with collar D.

$$\mathbf{r}_{P/A} = 12\cos 30° \measuredangle 30° = 10.392 \text{ in.} \measuredangle 30°.$$

$$\mathbf{a}_P = \mathbf{a}_A + (\mathbf{a}_{P/A})_t + (\mathbf{a}_{P/A})_n$$

$$= 0 + [(10.392)(52.624) \searrow 60°] + [(10.392)(3.6085)^2 \swarrow 30°]$$

$$= [546.87 \searrow 60°] + [135.32 \swarrow 30°] = [390.63 \leftarrow] + [405.94 \downarrow]$$

$$\mathbf{a}_P = 563 \text{ in./s}^2 \swarrow 46.1° \blacktriangleleft$$

PROBLEM 15.183*

In Problem 15.157, determine the acceleration of pin *P*.

PROBLEM 15.157 The motion of pin *P* is guided by slots cut in rods *AD* and *BE*. Knowing that bar *AD* has a constant angular velocity of 4 rad/s clockwise and bar *BE* has an angular velocity of 5 rad/s counterclockwise and is slowing down at a rate of 2 rad/s^2, determine the velocity of *P* for the position shown.

SOLUTION

Units: meters, m/s, m/s^2

Unit vectors: $\mathbf{i} = 1 \longrightarrow, \quad \mathbf{j} = 1 \uparrow, \quad \mathbf{k} = 1 \circlearrowleft$

From the solution of Problem 15.157,

$$\theta = 26.565° \qquad R = 0.100 \text{ m}$$

$$\mathbf{r}_{P/A} = 0.1\mathbf{i} + 0.15\mathbf{j} \qquad \mathbf{r}_{P/B} = -0.3\mathbf{i} + 0.15\mathbf{j}$$

$$\boldsymbol{\omega}_{AD} = -(4 \text{ rad/s})\mathbf{k} \qquad \boldsymbol{\omega}_{BE} = (5 \text{ rad/s}^2)\mathbf{k}$$

$$\boldsymbol{\alpha}_{AD} = 0 \qquad \boldsymbol{\alpha}_{BE} = -(2 \text{ rad/s}^2)\mathbf{k}$$

$$\mathbf{v}_{P/AD} = u_1\mathbf{j} = -(1.775 \text{ m/s})\mathbf{j}$$

$$\begin{aligned}\mathbf{v}_{P/BE} &= -u_2 \cos\theta\mathbf{i} + u_2 \sin\theta\mathbf{j} \\ &= (-1.50935)(-\cos 26.565°\mathbf{i} + \sin 26.565°)\mathbf{j} \\ &= (1.35 \text{ m/s})\mathbf{i} + (0.675 \text{ m/s})\mathbf{j}\end{aligned}$$

Acceleration of Point *P′* on rod *AD* coinciding with the pin:

$$\begin{aligned}\mathbf{a}_{P'} &= \boldsymbol{\alpha}_{AD} \times \mathbf{r}_{P/A} - \omega_{AD}^2 \mathbf{r}_{P/A} \\ &= 0 - (4)^2(0.1\mathbf{i} + 0.15\mathbf{j}) = -1.6\mathbf{i} - 2.4\mathbf{j}\end{aligned}$$

Acceleration of the pin relative to rod *AD*:

$$\begin{aligned}\mathbf{a}_{P/AD} &= \dot{u}_1\mathbf{j} - \frac{u_1^2}{R}\mathbf{i} = \dot{u}_1\mathbf{j} - \frac{(1.775)^2}{0.15}\mathbf{i} \\ &= \dot{u}_1\mathbf{j} - 21.004\mathbf{i}\end{aligned}$$

Coriolis acceleration: $\mathbf{a}_1 = 2\boldsymbol{\omega}_{AD} \times \mathbf{v}_{P/AD}$

$$\mathbf{a}_1 = 2(-4\mathbf{k}) \times (-1.775\mathbf{j}) = -14.2\mathbf{i}$$

Acceleration of *P*: $\mathbf{a}_P = \mathbf{a}_{P'} + \mathbf{a}_{P/AD} + \mathbf{a}_1$

$$\mathbf{a}_P = -36.804\mathbf{i} - 2.4\mathbf{j} + \dot{u}_1\mathbf{j}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

Acceleration of Point P'' on rod BE coinciding with the pin

$$\mathbf{a}_{P''} = \boldsymbol{\alpha}_{BE} \times \mathbf{r}_{P/B} - \omega_{BE}^2 \mathbf{r}_{P/E}$$
$$= (-2\mathbf{k}) \times (-0.3\mathbf{i} + 0.15\mathbf{j}) - (5)^2(-0.3\mathbf{i} + 0.15\mathbf{j})$$
$$= 0.6\mathbf{j} + 0.3\mathbf{i} + 7.5\mathbf{i} - 3.75\mathbf{j} = 7.8\mathbf{i} - 3.15\mathbf{j}$$

Acceleration of the pin relative to the rod BE:

$$\mathbf{a}_{P/BE} = \dot{u}_2(-\cos\theta\,\mathbf{i} + \sin\theta\,\mathbf{j})$$

Coriolis acceleration:

$$\mathbf{a}_2 = 2\boldsymbol{\omega}_{BE} \times \mathbf{v}_{P/BE}$$
$$= (2)(5\mathbf{k}) \times (1.35\mathbf{i} - 0.675\mathbf{j}) = -13.5\mathbf{j} + 6.75\mathbf{i}$$

Acceleration of P:

$$\mathbf{a}_P = \mathbf{a}_{P''} + \mathbf{a}_{P/BE} + \mathbf{a}_2$$

$$\mathbf{a}_P = 7.8\mathbf{i} - 3.15\mathbf{j} + \dot{u}_2(-\cos\theta\mathbf{i} + \sin\theta\mathbf{j}) + 13.5\mathbf{j} + 6.75\mathbf{i}$$
$$= 14.55\mathbf{i} + 10.35\mathbf{j} - \dot{u}_2\cos\theta\mathbf{i} + \dot{u}_2\sin\theta\mathbf{j}$$

Equating the two expressions for $\mathbf{a}_P$ and resolving into components,

i:
$$-36.804 = 14.55 - \dot{u}_2\cos\theta$$
$$\dot{u}_2 = \frac{36.804 + 14.55}{\cos 26.565^\circ} = 57.415 \text{ m/s}^2$$

j:
$$-2.4 + \dot{u}_1 = 10.35 + \dot{u}_2\sin\theta$$
$$\dot{u}_1 = 12.75 + 57.415\sin 26.565^\circ = 38.426 \text{ m/s}^2$$

Acceleration of the pin.

$$\mathbf{a}_P = -36.804\mathbf{i} - 2.4\mathbf{j} + 38.427\mathbf{j}$$
$$= -36.804\mathbf{i} + 36.027\mathbf{j}$$

$$\mathbf{a}_P - (36.8 \text{ m/s}^2)\mathbf{i} + (36.0 \text{ m/s}^2)\mathbf{j} = 51.5 \text{ m/s}^2 \measuredangle 44.4^\circ \blacktriangleleft$$

PROBLEM 15.184

At the instant considered, the radar antenna shown rotates about the origin of coordinates with an angular velocity $\boldsymbol{\omega} = \omega_x \mathbf{i} + \omega_y \mathbf{j} + \omega_z \mathbf{k}$. Knowing that $(v_A)_y = 300$ mm/s, $(v_B)_y = 180$ mm/s, and $(v_B)_z = 360$ mm/s, determine (*a*) the angular velocity of the antenna, (*b*) the velocity of Point *A*.

SOLUTION

$$\mathbf{r}_A = (0.3 \text{ m})\mathbf{i} - (0.25 \text{ m})\mathbf{k}$$

$$\mathbf{v}_A = (v_A)_x \mathbf{i} + (0.3 \text{ m/s})\,\mathbf{j} + (v_A)_z \mathbf{k}$$

$$\mathbf{v}_A = \boldsymbol{\omega} \times \mathbf{r}_A: \quad (v_A)_x \mathbf{i} + 0.3\mathbf{j} + (v_A)_z \mathbf{k} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \omega_x & \omega_y & \omega_z \\ 0.3 & 0 & -0.25 \end{vmatrix}$$

$$(v_A)_x \mathbf{i} + 0.3\mathbf{j} + (v_A)_z \mathbf{k} = -0.25\omega_y \mathbf{i} + (0.3\omega_z + 0.25\omega_x)\mathbf{j} - 0.3\omega_y \mathbf{k}$$

$$\mathbf{i}: \quad (v_A)_x = -0.25\omega_y \qquad (1)$$

$$\mathbf{j}: \quad 0.3 = 0.3\omega_z + 0.25\omega_x \qquad (2)$$

$$\mathbf{k}: \quad (v_A)_z = -0.3\omega_y \qquad (3)$$

$$\mathbf{r}_B = (0.3 \text{ m})\mathbf{i} - (0.25 \text{ m})\mathbf{j}$$

$$\mathbf{v}_B = (v_B)_x \mathbf{i} + (0.18 \text{ m/s})\mathbf{j} + (0.36 \text{ m/s})\mathbf{k}$$

$$\mathbf{v}_B = \boldsymbol{\omega} \times \mathbf{r}_B: \quad (v_B)_x \mathbf{i} + 0.18\mathbf{j} + 0.36\mathbf{k} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \omega_x & \omega_y & \omega_z \\ 0.3 & -0.25 & 0 \end{vmatrix}$$

$$(v_B)_x \mathbf{i} + 0.18\mathbf{j} + 0.36\mathbf{k} = 0.25\omega_z \mathbf{i} + 0.3\omega_z \mathbf{j} - (0.25\omega_x + 0.3\omega_y)\mathbf{k}$$

$$\mathbf{i}: \quad (v_B)_x = 0.3\omega_z \qquad (4)$$

$$\mathbf{j}: \quad 0.18 = 0.3\omega_z \qquad (5)$$

$$\mathbf{k}: \quad 0.36 = -0.25\omega_x - 0.3\omega_y \qquad (6)$$

From Eq. (5), $\omega_z = 0.6$ rad/s

If you are a student using this Manual, you are using it without permission.*

PROBLEM 15.186

Plate *ABD* and rod *OB* are rigidly connected and rotate about the ball-and-socket joint *O* with an angular velocity $\boldsymbol{\omega} = \omega_x\,\mathbf{i} + \omega_x\,\mathbf{j} + \omega_z\,\mathbf{k}$. Knowing that $\mathbf{v}_A = (80\text{ mm/s})\mathbf{i} + (360\text{ mm/s})\mathbf{j} + (v_A)_z\,\mathbf{k}$ and $\omega_x = 1.5\text{ rad/s}$, determine (*a*) the angular velocity of the assembly, (*b*) the velocity of Point *D*.

SOLUTION

$$\omega_x = 1.5\text{ rad/s} \qquad \boldsymbol{\omega} = (1.5\text{ rad/s})\mathbf{i} + \omega_y\mathbf{j} + \omega_z\mathbf{k}$$

$$\mathbf{r}_A = -(160\text{ mm})\mathbf{i} + (120\text{ mm})\mathbf{j} + (80\text{ mm})\mathbf{k}$$

$$\mathbf{r}_D = +(160\text{ mm})\mathbf{i} + (120\text{ mm})\mathbf{j} - (80\text{ mm})\mathbf{k}$$

(*a*)

$$\mathbf{v}_A = \boldsymbol{\omega}\times\mathbf{r}_A$$

$$= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1.5 & \omega_y & \omega_z \\ -160 & +120 & +80 \end{vmatrix}$$

$$\mathbf{v}_A = (80\omega_y - 120\omega_z)\mathbf{i} + (-160\omega_z - 120)\mathbf{j} + (180 + 160\omega_y)\mathbf{k}$$

But we are given:

$$\mathbf{v}_A = (80\text{ mm/s})\mathbf{i} + (360\text{ mm/s})\mathbf{j} + (v_A)_z\mathbf{k}$$

$$(v_A)_x:\quad 80\omega_y - 120\omega_z = 80 \tag{1}$$

$$(v_A)_y:\quad -160\omega_x - 120 = 360 \qquad \omega_z = -3\text{ rad/s} \tag{2}$$

$$(v_A)_z:\quad 180 + 160\omega_y = (v_A)_z \tag{3}$$

Substitute $\omega_z = -3.0\text{ rad/s}$ into Eq. (1):

$$80\omega_y - 120(-3) = 80$$

$$\omega_y = -3.5\text{ rad/s}$$

Substitute $\omega_y = -3.5\text{ rad/s}$ into Eq. (3):

$$180 + 160(-3.5) = (v_A)_z$$

$$(v_A)_z = -380\text{ in./s}$$

We have: $\boldsymbol{\omega} = (1.5\text{ rad/s})\mathbf{i} - (3.5\text{ rad/s})\mathbf{j} - (3.0\text{ rad/s})\mathbf{k}$ ◀

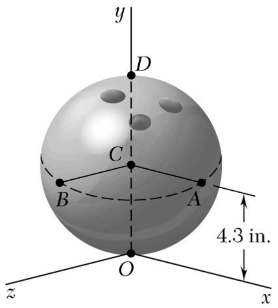
PROBLEM 15.187



The bowling ball shown rolls without slipping on the horizontal xz plane with an angular velocity $\omega = \omega_x\mathbf{i} + \omega_y\mathbf{j} + \omega_z\mathbf{k}$. Knowing that $\mathbf{v}_A = (14.4 \text{ ft/s})\mathbf{i} - (14.4 \text{ ft/s})\mathbf{j} + (10.8 \text{ ft/s})\mathbf{k}$ and $\mathbf{v}_D = (28.8 \text{ ft/s})\mathbf{i} + (21.6 \text{ ft/s})\mathbf{k}$, determine (*a*) the angular velocity of the bowling ball, (*b*) the velocity of its center C.

SOLUTION

Radius of ball: 4.3 in. = 0.35833 ft

At the given instant, the origin is not moving.

$$\mathbf{v}_A = \boldsymbol{\omega} \times \mathbf{r}_A: \quad 14.4\mathbf{i} - 14.4\mathbf{j} + 10.8\mathbf{k} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \omega_x & \omega_y & \omega_z \\ 0.35833 & 0.35833 & 0 \end{vmatrix}$$

$$14.4\mathbf{i} - 14.4\mathbf{j} + 10.8\mathbf{k} = -0.35833\omega_z\mathbf{i} + 0.35833\omega_z\mathbf{j} + 0.35833(\omega_x - \omega_y)\mathbf{k}$$

$$\mathbf{i}: \quad -0.35833\omega_z = 14.4 \qquad \omega_z = -40.186 \text{ rad/s}$$

$$\mathbf{j}: \quad 0.35833\omega_z = -14.4 \qquad \omega_z = -40.186 \text{ rad/s}$$

$$\mathbf{k}: \quad 0.35833(\omega_x - \omega_y) = 10.8 \qquad \omega_x - \omega_y = 30.140 \text{ rad/s}$$

$$\mathbf{v}_D = \boldsymbol{\omega} \times \mathbf{r}_D: \quad 28.8\mathbf{i} + 21.6\mathbf{k} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \omega_x & \omega_y & \omega_z \\ 0 & 0.71667 & 0 \end{vmatrix}$$

$$28.8\mathbf{i} + 21.6\mathbf{k} = -0.71667\omega_z\mathbf{i} + 0.71667\omega_x\mathbf{k}$$

$$\mathbf{i}: \quad -0.71667\omega_z = 28.8 \qquad \omega_z = -40.186 \text{ rad/s}$$

$$\mathbf{k}: \quad 0.71667\omega_x = 21.6 \qquad \omega_x = 30.140 \text{ rad/s}$$

$$\omega_y = \omega_x - 30.140 = 0$$

(*a*) *Angular velocity.* $\boldsymbol{\omega} = (30.1 \text{ rad/s})\mathbf{i} - (40.2 \text{ rad/s})\mathbf{k}$ ◀

(*b*) *Velocity of Point C.*

$$\mathbf{v}_C = \boldsymbol{\omega} \times \mathbf{r}_C = (30.140\mathbf{i} - 40.186\mathbf{k}) \times 0.35833\mathbf{j}$$

$$= 14.4\mathbf{i} + 10.8\mathbf{k}$$

$\mathbf{v}_C = (14.4 \text{ ft/s})\mathbf{i} + (10.8 \text{ ft/s})\mathbf{k}$ ◀

	**PROBLEM 15.188** The rotor of an electric motor rotates at the constant rate $\omega_1 = 1800$ rpm. Determine the angular acceleration of the rotor as the motor is rotated about the y axis with a constant angular velocity $\boldsymbol{\omega}_2$ of 6 rpm counterclockwise when viewed from the positive y axis.

SOLUTION

$$\omega_1 = 1800 \text{ rpm}$$
$$= 60\pi \text{ rad/s}$$
$$\omega_2 = 6 \text{ rpm}$$
$$= 0.2\pi \text{ rad/s}$$

Total angular velocity.

$$\boldsymbol{\omega} = \omega_2 \mathbf{j} + \omega_1 \mathbf{k}$$
$$\boldsymbol{\omega} = (0.2\pi \text{ rad/s})\mathbf{j} + (60\pi \text{ rad/s})\mathbf{k}$$

Angular acceleration.

Frame *Oxyz* is rotating with angular velocity $\boldsymbol{\Omega} = \omega_2 \mathbf{j}$.

$$\boldsymbol{\alpha} = \dot{\boldsymbol{\omega}}$$
$$= \dot{\boldsymbol{\omega}}_{Oxyz} + \boldsymbol{\Omega} \times \boldsymbol{\omega}$$
$$= 0 + \omega_2 \mathbf{j} \times (\omega_2 \mathbf{j} + \omega_1 \mathbf{k})$$
$$= \omega_2 \omega_1 \mathbf{i}$$
$$\boldsymbol{\alpha} = (0.2\pi)(60\pi)\mathbf{i}$$
$$= (12\pi^2 \text{ rad/s}^2)\mathbf{i}$$

$$\boldsymbol{\alpha} = (118.4 \text{ rad/s}^2)\mathbf{i} \blacktriangleleft$$

PROBLEM 15.189

The disk of a portable sander rotates at the constant rate $\omega_1 = 4400$ rpm as shown. Determine the angular acceleration of the disk as a worker rotates the sander about the *z* axis with an angular velocity of 0.5 rad/s and an angular acceleration of 2.5 rad/s^2, both clockwise when viewed from the positive *z* axis.

SOLUTION

Spin rate: $\omega_1 = 4400 \text{ rpm} = 460.77 \text{ rad/s}$

Angular velocity of disk relative to the housing:

$$\boldsymbol{\omega}_1 = (460.77 \text{ rad/s})\,\mathbf{j}$$

Angular motion of the housing:

$$\boldsymbol{\omega}_2 = -(0.5 \text{ rad/s})\mathbf{k} \qquad \dot{\boldsymbol{\omega}}_2 = -(2.5 \text{ rad/s}^2)\mathbf{k}$$

Consider a frame of reference rotating with angular velocity

$$\boldsymbol{\Omega} = \omega_2\mathbf{k} = -(0.5 \text{ rad/s})\mathbf{k}$$

Angular velocity of the disk:

$$\begin{aligned}\boldsymbol{\omega} &= \boldsymbol{\omega}_1 + \boldsymbol{\omega}_2\\ &= (460.77 \text{ rad/s})\mathbf{j} - (0.5 \text{ rad/s})\mathbf{k}\end{aligned}$$

Angular acceleration of the disk:

$$\begin{aligned}\boldsymbol{\alpha} &= \dot{\boldsymbol{\omega}}_1 + \dot{\boldsymbol{\omega}}_2 + \boldsymbol{\Omega}\times(\boldsymbol{\omega}_1 + \boldsymbol{\omega}_2)\\ &= 0 - 2.5\mathbf{k} + (-0.5\mathbf{k})\times(460.77\mathbf{j} - 0.5\mathbf{k})\\ &= (230.38 \text{ rad/s}^2)\mathbf{i} - (2.5 \text{ rad/s}^2)\mathbf{k}\end{aligned}$$

$$\boldsymbol{\alpha} = (230 \text{ rad/s}^2)\mathbf{i} - (2.5 \text{ rad/s}^2)\mathbf{k} \blacktriangleleft$$

PROBLEM 15.190

Knowing that the turbine rotor shown rotates at a constant rate $\omega_1 = 9000$ rpm, determine the angular acceleration of the rotor if the turbine housing has a constant angular velocity of 2.4 rad/s clockwise as viewed from (*a*) the positive *y* axis, (*b*) the positive *z* axis.

SOLUTION

Spin rate: $\omega_1 = 9000 \text{ rpm} = 942.48 \text{ rad/s}$

Angular velocity of the rotor relative to the axle:

$$\boldsymbol{\omega}_1 = -(942.48 \text{ rad/s})\mathbf{i}$$

(*a*) Axle rotates with angular velocity $\boldsymbol{\omega}_2 = -(2.4 \text{ rad/s})\mathbf{j}$

Consider a frame of reference rotating with angular velocity

$$\boldsymbol{\Omega} = \omega_2 \mathbf{j}$$

Angular acceleration:

$$\begin{aligned}\boldsymbol{\alpha} &= \dot{\boldsymbol{\omega}}_1 \mathbf{i} + \dot{\boldsymbol{\omega}}_2 \mathbf{j} + \boldsymbol{\Omega} \times (\boldsymbol{\omega}_1 + \boldsymbol{\omega}_2) \\ &= 0 + 0 + \boldsymbol{\Omega} \times \boldsymbol{\omega}_1 \\ &= (-2.4\mathbf{j}) \times (-942.48\mathbf{i})\end{aligned}$$

$$\boldsymbol{\alpha} = -(2260 \text{ rad/s}^2)\mathbf{k} \blacktriangleleft$$

(*b*) Axle rotates with angular velocity $\boldsymbol{\omega}_2 = -(2.4 \text{ rad/s})\mathbf{k}$.

$$\boldsymbol{\Omega} = -(2.4 \text{ rad/s})\mathbf{k}$$

$$\boldsymbol{\alpha} = \boldsymbol{\Omega} \times \boldsymbol{\omega}_1 = (-2.4\mathbf{k}) \times (-942.48\mathbf{i})$$

$$\boldsymbol{\alpha} = (2260 \text{ rad/s}^2)\mathbf{j} \blacktriangleleft$$

PROBLEM 15.191

In the system shown, disk A is free to rotate about the horizontal rod OA. Assuming that disk B is stationary $(\omega_2 = 0)$, and that shaft OC rotates with a constant angular velocity ω_1, determine (*a*) the angular velocity of disk A, (*b*) the angular acceleration of disk A.

SOLUTION

Disk A (In rotation about O):

Since $\omega_y = \omega_1,$

$$\boldsymbol{\omega}_A = \omega_x \mathbf{i} + \omega_1 \mathbf{j} + \omega_z \mathbf{k}$$

Point D is point of contact of wheel and disk.

$$\mathbf{r}_{D/O} = -r\mathbf{j} - R\mathbf{k}$$

$$\mathbf{v}_D = \boldsymbol{\omega}_A \times \mathbf{r}_{D/O}$$

$$= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \omega_x & \omega_1 & \omega_z \\ 0 & -r & -R \end{vmatrix}$$

$$\mathbf{v}_D = (-R\omega_1 + r\omega_z)\mathbf{i} + R\omega_1 \mathbf{j} - r\omega_x \mathbf{k}$$

Since $\omega_2 = 0,\ \mathbf{v}_D = 0.$

Each component of $\mathbf{v}_D$ is zero.

$$(v_D)_z = r\omega_x = 0; \quad \omega_x = 0$$

$$(v_D)_x = -R\omega_1 + r\omega_z = 0; \quad \omega_z = \left(\frac{R}{r}\right)\omega_1$$

(*a*) Angular velocity.

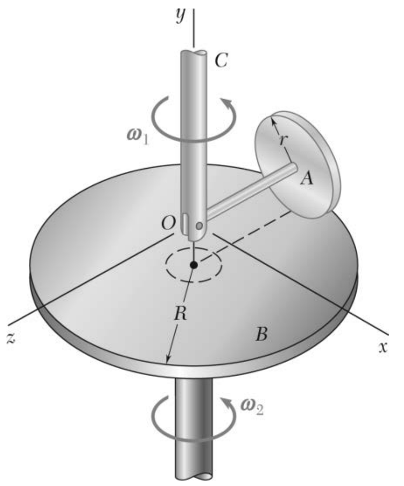
$$\boldsymbol{\omega}_A = \omega_1 \mathbf{j} + \left(\frac{R}{r}\right)\omega_1 \mathbf{k} \ \blacktriangleleft$$

(*b*) Angular acceleration. Disk A rotates about y axis at rate ω_1.

$$\boldsymbol{\alpha}_A = \frac{d\boldsymbol{\omega}_A}{dt} = \boldsymbol{\omega}_y \times \boldsymbol{\omega}_A = \omega_1 \mathbf{j} \times \left(\omega_1 \mathbf{j} + \frac{R}{r}\omega_1 \mathbf{k}\right)$$

$$\boldsymbol{\alpha}_A = \frac{R}{r}\omega_1^2 \mathbf{i} \ \blacktriangleleft$$

If you are a student using this Manual, you are using it without permission.*



PROBLEM 15.192

In the system shown, disk A is free to rotate about the horizontal rod OA. Assuming that shaft OC and disk B rotate with constant angular velocities ω_1 and ω_2, respectively, both counterclockwise, determine (*a*) the angular velocity of disk A, (*b*) the angular acceleration of disk A.

SOLUTION

Disk A (in rotation about O):

Since $\omega_y = \omega_1$, $\quad \boldsymbol{\omega}_A = \omega_x \mathbf{i} + \omega_1 \mathbf{j} + \omega_z \mathbf{k}$

Point D is point of contact of wheel and disk.

$$\mathbf{r}_{D/O} = -r\mathbf{j} - R\mathbf{k}$$

$$\mathbf{v}_D = \boldsymbol{\omega}_A \times \mathbf{r}_{D/O} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \omega_x & \omega_1 & \omega_z \\ 0 & -r & -R \end{vmatrix}$$

$$\mathbf{v}_D = (-R\omega_1 + r\omega_z)\mathbf{i} + R\omega_x \mathbf{j} - r\omega_x \mathbf{k} \qquad (1)$$

Disk B: $\quad \boldsymbol{\omega}_B = \omega_2 \mathbf{j}$

$$\mathbf{v}_D = \boldsymbol{\omega}_B \times \mathbf{r}_{D/O} = \omega_2 \mathbf{j} \times (-r\mathbf{j} - R\mathbf{k}) = -R\omega_2 \mathbf{i} \qquad (2)$$

From Eqs. 1 and 2: $\quad \mathbf{v}_D = \mathbf{v}_D: \quad (-R\omega_1 - r\omega_z)\mathbf{i} + R\omega_x \mathbf{j} - r\omega_x \mathbf{k} = -R\omega_2 \mathbf{i}$

Coefficients of **k**: $\quad -r\omega_x = 0; \qquad \omega_x = 0$

Coefficients of **i**: $\quad (-R\omega_1 + r\omega_z) = -R\omega_2; \quad \omega_z = \frac{R}{r}(\omega_1 - \omega_2)$

(*a*) Angular velocity. $\quad \boldsymbol{\omega}_A = \omega_1 \mathbf{j} + \frac{R}{r}(\omega_1 - \omega_2)\mathbf{k}$ ◀

(*b*) Angular acceleration. Disk A rotates about y axis at rate ω_1.

$$\boldsymbol{\alpha}_A = \frac{d\boldsymbol{\omega}_A}{dt} = \boldsymbol{\omega}_y \times \boldsymbol{\omega}_A = \omega_1 \mathbf{j} \times \left[\omega_1 \mathbf{j} + \frac{R}{r}(\omega_1 - \omega_2)\mathbf{k}\right] \qquad \boldsymbol{\alpha}_A = \frac{R}{r}\omega_1(\omega_1 - \omega_2)\mathbf{i}$$ ◀

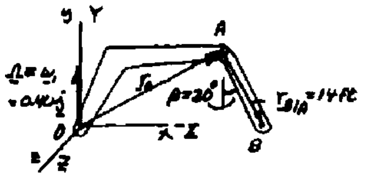
PROBLEM 15.194

The cab of the backhoe shown rotates with the constant angular velocity $\boldsymbol{\omega}_1 = (0.4 \text{ rad/s})\mathbf{j}$ about the *y* axis. The arm *OA* is fixed with respect tot he cab, while the arm *AB* rotates about the horizontal axle *A* at the constant rate $\omega_2 = d\beta/dt = 0.6$ rad/s. Knowing that $\beta = 30°$, determine (*a*) the angular velocity and angular acceleration of *AB*, (*b*) the velocity and acceleration of Point *B*.

SOLUTION



$$\mathbf{r}_A = 20\mathbf{i} + 8\mathbf{j} \qquad \text{(ft)}$$
$$\mathbf{r}_{B/A} = 7\mathbf{i} - 12.12\mathbf{j} \qquad \text{(ft)}$$
$$\mathbf{r}_B = 27\mathbf{i} - 4.12\mathbf{j} \qquad \text{(ft)}$$

O_{XYZ} is fixed; O_{xyz} rotates with $\boldsymbol{\Omega} = 0.40\mathbf{j}$

Angular velocity of *AB*

With respect to rotating frame: $\boldsymbol{\omega}_2 = +(0.60 \text{ rad/s})\mathbf{k}$

With respect to fixed frame: $\boldsymbol{\omega} = \boldsymbol{\omega}_1 + \boldsymbol{\omega}_2 = (0.40 \text{ rad/s})\mathbf{j} + (0.60 \text{ rad/s})\mathbf{k}$ ◀

Angular acceleration of *AB*

$$\boldsymbol{\alpha} = (\dot{\boldsymbol{\omega}})_{Oxyz} = (\dot{\boldsymbol{\omega}})_{Oxyz} + \boldsymbol{\Omega} \times \boldsymbol{\omega}$$

$$\boldsymbol{\alpha} = 0 + (0.40\mathbf{j}) \times (0.40\mathbf{j} + 0.60\mathbf{k}) \qquad \boldsymbol{\alpha} = (0.24 \text{ rad/s}^2)\mathbf{i} \text{ ◀}$$

Motion of *B* relative to rotating frame O_{xyz}.

Since *A* does not move relative to O_{xyz},

$$(\mathbf{v}_{B/F}) = (\dot{\mathbf{r}}_B)_{Oxyz} = (\dot{\mathbf{r}}_A)_{Oxyz} + (\dot{\mathbf{r}}_{B/A})_{Oxyz} = 0 + \boldsymbol{\omega}' \times \mathbf{r}_{B/A}$$
$$= (0.60\mathbf{k}) \times (7\mathbf{i} - 12.12\mathbf{j})$$
$$\mathbf{v}_{B/F} = (7.27 \text{ ft/s})\mathbf{i} + (4.2 \text{ ft/s})\mathbf{j} \qquad (1)$$

$$(\mathbf{a}_{B/F}) = (\ddot{\mathbf{r}}_A)_{Oxyz} + (\ddot{\mathbf{r}}_{B/A})_{Oxyz} = 0 + \boldsymbol{\omega}' \times (\boldsymbol{\omega}' \times \mathbf{r}_{B/A})$$
$$= (0.60\mathbf{k}) \times (7.27\mathbf{i} - 4.2\mathbf{j})$$
$$\mathbf{a}_{B/F} = (2.52 \text{ ft/s}^2)\mathbf{i} + (4.36 \text{ ft/s}^2)\mathbf{j} \qquad (2)$$

Motion of B' of frame O_{xyz} which coincides with *B*.

$$\mathbf{v}_{B'} = \boldsymbol{\Omega} \times \mathbf{r}_B = (0.40\mathbf{j}) \times (27\mathbf{i} - 4.12\mathbf{j})$$
$$\mathbf{v}_{B'} = -(10.8 \text{ ft/s})\mathbf{k} \qquad (3)$$

$$\mathbf{a}_{B'} = \boldsymbol{\Omega} \times (\boldsymbol{\Omega} \times \mathbf{r}_B) = \boldsymbol{\Omega} \times \mathbf{v}_{B'} = (0.4\mathbf{j}) \times (-10.8\mathbf{k})$$
$$\mathbf{a}_{B'} = -(4.32 \text{ ft/s}^2)\mathbf{i} \qquad (4)$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. If you are a student using this Manual, you are using it without permission.*

PROBLEM 15.194 (Continued)

Velocity of B using Equations (1) and (3):

$$\mathbf{v}_{B'} = \mathbf{v}_{B'} + \mathbf{v}_{B/F} = -10.8\mathbf{k} + 7.27\mathbf{i} + 4.2\mathbf{j}$$

$$\mathbf{v}_B = (7.27 \text{ ft/s})\mathbf{i} + (4.2 \text{ ft/s})\mathbf{j} - (10.8 \text{ ft/s})\mathbf{k} \blacktriangleleft$$

Acceleration of B

$$\mathbf{a}_B = \mathbf{a}_{B'} + \mathbf{a}_{B/F} + \mathbf{a}_C$$

We first compute the Coriolis acceleration. $\mathbf{a}_C$

$$\mathbf{a}_C = 2\mathbf{\Omega} \times \mathbf{v}_{B/F} = 2(0.40\mathbf{j}) \times (7.27\mathbf{i} + 4.2\mathbf{j})$$

Recalling Equations (2) and (4), we now write

$$\mathbf{a}_B = -4.32\mathbf{i} - 2.52\mathbf{i} + 4.36\mathbf{j} - 5.82\mathbf{k}$$

$$\mathbf{a}_B = -(6.84 \text{ ft/s}^2)\mathbf{i} + (4.36 \text{ ft/s}^2)\mathbf{j} - (5.82 \text{ ft/s}^2)\mathbf{k} \blacktriangleleft$$

PROBLEM 15.196

A 3-in.-radius disk spins at the constant rate $\omega_2 = 4$ rad/s about an axis held by a housing attached to a horizontal rod that rotates at the constant rate $\omega_1 = 5$ rad/s. Knowing that $\theta = 30°$, determine the acceleration of Point P on the rim of the disk.

SOLUTION

Angular velocity.

$$\boldsymbol{\omega} = \omega_1 \mathbf{i} + \omega_2 \mathbf{k}$$

$$\boldsymbol{\omega} = (5 \text{ rad/s})\mathbf{i} + (4 \text{ rad/s})\mathbf{k}$$

Angular acceleration. Frame *Oxyz* is rotating with angular velocity $\boldsymbol{\Omega} = \omega_1 \mathbf{i}$.

$$\boldsymbol{\alpha} = \dot{\boldsymbol{\omega}} = \dot{\boldsymbol{\omega}}_{Oxyz} + \boldsymbol{\Omega} \times \boldsymbol{\omega}$$

$$= 0 + \omega_1 \mathbf{i} \times (\omega_1 \mathbf{i} + \omega_2 \mathbf{k})$$

$$= -\omega_1 \omega_2 \mathbf{j}$$

$$= -(4)(5)\mathbf{j} = -20\mathbf{j}$$

$$\boldsymbol{\alpha} = -(20.0 \text{ rad/s}^2)\mathbf{j}$$

Geometry. $\theta = 30°$,

$$\mathbf{r}_P = (3 \text{ in.})(\cos 30° \mathbf{i} + \sin 30° \mathbf{j})$$

$$= (0.25 \text{ ft})(\cos 30° \mathbf{i} + \sin 30° \mathbf{j})$$

Velocity of Point P.

$$\mathbf{v}_P = \boldsymbol{\omega} \times \mathbf{r}_P$$

$$= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 5 & 0 & 4 \\ 0.25\cos 30° & 0.25\sin 30° & 0 \end{vmatrix}$$

$$= -(0.5 \text{ ft/s})\mathbf{i} + (0.86603 \text{ ft/s})\mathbf{j} + (0.625 \text{ ft/s})\mathbf{k}$$

Acceleration of Point P.

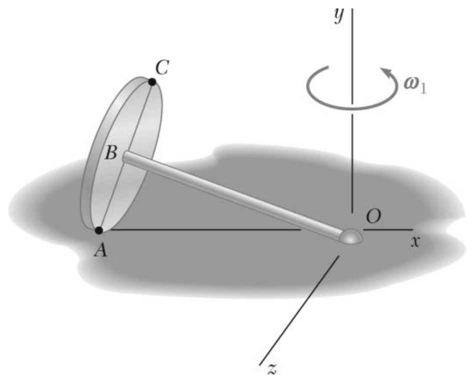
$$\mathbf{a}_P = \boldsymbol{\alpha} \times \mathbf{r}_P + \boldsymbol{\omega} \times \mathbf{v}_P$$

$$= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 0 & -20 & 0 \\ 0.25\cos 30° & 0.25\sin 30° & 0 \end{vmatrix} + \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 5 & 0 & 4 \\ -0.5 & 0.86603 & 0.625 \end{vmatrix}$$

$$= 4.3301\mathbf{k} - 3.4641\mathbf{i} - 5.125\mathbf{j} + 4.3301\mathbf{k}$$

$$\mathbf{a}_P = -(3.46 \text{ ft/s}^2)\mathbf{i} - (5.13 \text{ ft/s}^2)\mathbf{j} + (8.66 \text{ ft/s}^2)\mathbf{k} \blacktriangleleft$$

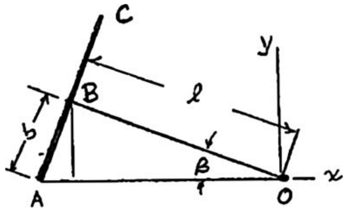
If you are a student using this Manual, you are using it without permission.*



PROBLEM 15.197

A 30 mm-radius wheel is mounted on an axle OB of length 100 mm. The wheel rolls without sliding on the horizontal floor, and the axle is perpendicular to the plane of the wheel. Knowing that the system rotates about the y axis at a constant rate $\omega_1 = 2.4$ rad/s, determine (a) the angular velocity of the wheel, (b) the angular acceleration of the wheel, (c) the acceleration of Point C located at the highest point on the rim of the wheel.

SOLUTION



Geometry.

$$l = 100 \text{ mm} = 0.1 \text{ m}$$

$$b = 30 \text{ mm} = 0.03 \text{ m}$$

$$\tan\beta = \frac{b}{l} = 0.3$$

$$\beta = 16.699°$$

$$\mathbf{r}_A = -l\sec\beta\mathbf{i}$$

$$\mathbf{r}_B = -l\cos\beta\mathbf{i} + b\cos\beta\mathbf{j}$$

(a) *Angular velocities.*

For the system, $\quad \mathbf{\Omega} = \omega_1\mathbf{j} = (2.4 \text{ rad/s})\mathbf{j}$

For the wheel, $\quad \boldsymbol{\omega} = \omega_x\mathbf{i} + \omega_y\mathbf{j} + \omega_z\mathbf{k}$

$$\mathbf{v}_A = \boldsymbol{\omega}\times\mathbf{r}_A = (\omega_x\mathbf{i} + \omega_y\mathbf{j} + \omega_z\mathbf{k})\times(-l\sec\beta\mathbf{i}) = 0$$

$$-(l\omega_z\sec\beta)\mathbf{j} - (l\omega_y\sec\beta)\mathbf{k} = 0$$

$$\omega_y = 0, \quad \omega_z = 0 \qquad \boldsymbol{\omega} = \omega_x\mathbf{i}$$

$$\mathbf{v}_B = \boldsymbol{\omega}\times\mathbf{r}_B$$

$$= \omega_x\mathbf{i}\times(-l\cos\beta\mathbf{i} + b\cos\beta\mathbf{j})$$

$$= (\omega_x b\cos\beta)\mathbf{k}$$

For the system, $\quad \mathbf{v}_B = \mathbf{\Omega}\times\mathbf{r}_B$

$$= \omega_1\mathbf{j}\times(-l\cos\beta\mathbf{i} + b\cos\beta\mathbf{j})$$

$$= (\omega_1 l\cos\beta)\mathbf{k}$$

Matching the two expressions for $\mathbf{v}_B$,

$$\omega_x b\cos\beta = \omega_1 l\cos\beta$$

or $\quad \omega_x = \dfrac{\omega_1 l}{b} = \dfrac{(2.4)(30)}{100} = 8 \text{ rad/s} \qquad \boldsymbol{\omega} = (8.00 \text{ rad/s})\mathbf{i}$ ◀

PROBLEM 15.198

At the instant shown, the robotic arm *ABC* is being rotated simultaneously at the constant rate $\omega_1 = 0.15$ rad/s about the *y* axis, and at the constant rate $\omega_2 = 0.25$ rad/s about the *z* axis. Knowing that the length of arm *ABC* is 1 m, determine (*a*) the angular acceleration of the arm, (*b*) the velocity of Point *C*, (*c*) the acceleration of Point *C*.

SOLUTION

Angular velocity:

$$\boldsymbol{\omega} = \omega_1 \mathbf{j} + \omega_2 \mathbf{k}$$
$$= (0.15 \text{ rad/s})\mathbf{j} + (0.25 \text{ rad/s})\mathbf{k}$$

Consider a frame of reference rotating with angular velocity

$$\boldsymbol{\Omega} = \omega_1 \mathbf{j} = (0.15 \text{ rad/s})\mathbf{j}$$

(*a*) *Angular acceleration of the arm.*

$$\boldsymbol{\alpha} = \dot{\boldsymbol{\omega}}_1 + \dot{\boldsymbol{\omega}}_2 + \boldsymbol{\Omega} \times (\boldsymbol{\omega}_1 + \boldsymbol{\omega}_2)$$
$$= 0 + 0 + (0.15\mathbf{j}) \times (0.15\mathbf{j} + 0.25\mathbf{k})$$

$$\boldsymbol{\alpha} = (0.0375 \text{ rad/s}^2)\mathbf{i} \blacktriangleleft$$

Arm *ABC* rotates about the fixed Point *A*.

$$\mathbf{r}_{C/A} = (1 \text{ m})(\cos 35°\mathbf{i} + \sin 35°)\mathbf{j}$$
$$= (0.81915 \text{ m})\mathbf{i} + (0.57358 \text{ m})\mathbf{j}$$

(*b*) *Velocity of Point C.* $\mathbf{v}_C = \boldsymbol{\omega} \times \mathbf{r}_{C/A}$

$$\mathbf{v}_C = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 0 & 0.15 & 0.25 \\ 0.81915 & 0.57358 & 0 \end{vmatrix}$$
$$= -0.14340\mathbf{i} + 0.20479\mathbf{j} - 0.12287\mathbf{k}$$

$$\mathbf{v}_C = -(0.1434 \text{ m/s})\mathbf{i} + (0.204 \text{ m/s})\mathbf{j} - (0.1229 \text{ m/s})\mathbf{k} \blacktriangleleft$$

(*c*) *Acceleration of C*: $\mathbf{a}_C = \boldsymbol{\alpha} \times \mathbf{r}_{C/A} + \boldsymbol{\omega} \times \mathbf{v}_C$

$$\mathbf{a}_C = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 0.0375 & 0 & 0 \\ 0.81915 & 0.57358 & 0 \end{vmatrix} + \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 0 & 0.15 & 0.25 \\ -0.14340 & 0.20479 & -0.12287 \end{vmatrix}$$
$$= 0.021509\mathbf{k} + 0.06962\mathbf{i} + 0.03585\mathbf{j} + 0.02151\mathbf{k}$$

$$\mathbf{a}_C = -(0.0696 \text{ m/s}^2)\mathbf{i} + (0.0359 \text{ m/s}^2)\mathbf{j} + (0.0430 \text{ m/s}^2)\mathbf{k} \blacktriangleleft$$

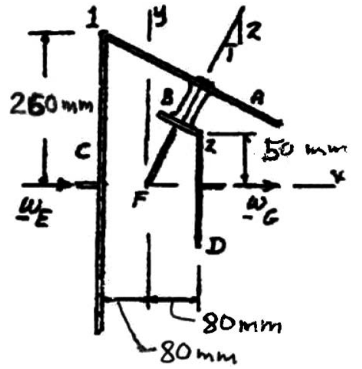
PROBLEM 15.199

In the planetary gear system shown, gears A and B are rigidly connected to each other and rotate as a unit about the inclined shaft. Gears C and D rotate with constant angular velocities of 30 rad/s and 20 rad/s, respectively (both counterclockwise when viewed from the right). Choosing the x axis to the right, the y axis upward, and the z axis pointing out of the plane of the figure, determine (a) the common angular velocity of gears A and B, (b) the angular velocity of shaft FH, which is rigidly attached to the inclined shaft.

SOLUTION



Place origin at F.

Point 1: $\mathbf{r}_1 = -(80\text{ mm})\mathbf{i} + (260\text{ mm})\mathbf{j}$

Point 2: $\mathbf{r}_2 = +(80\text{ mm})\mathbf{i} + (50\text{ mm})\mathbf{j}$

$$\boldsymbol{\omega}_E = +(30\text{ rad/s})\mathbf{i}$$

$$\boldsymbol{\omega}_G = +(20\text{ rad/s})\mathbf{i}$$

$$\mathbf{v}_1 = \boldsymbol{\omega}_E \times \mathbf{r}_1 = (30\mathbf{i}) \times (-80\mathbf{i} + 260\mathbf{j})$$

$$\mathbf{v}_1 = (7800\text{ mm/s})\mathbf{k} \quad (1)$$

$$\mathbf{v}_2 = \boldsymbol{\omega}_G \times \mathbf{r}_2 = (20\mathbf{i}) \times (80\mathbf{i} + 50\mathbf{j})$$

$$\mathbf{v}_2 = (1000\text{ mm/s})\mathbf{k} \quad (2)$$

Motion of gear unit AB: $\boldsymbol{\omega} = \omega_x\mathbf{i} + \omega_y\mathbf{j} + \omega_z\mathbf{k}$

$$\mathbf{v}_1 = \boldsymbol{\omega} \times \mathbf{r}_1 = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \omega_x & \omega_y & \omega_z \\ -80 & +260 & 0 \end{vmatrix}$$

$$= -260\omega_z\mathbf{i} - 80\omega_z\mathbf{j} + (260\omega_x + 80\omega_y)\mathbf{k}$$

Recall from Eq. (1) that $\mathbf{v} = 7800\mathbf{k}$.

$$7800\mathbf{k} = -260\omega_z\mathbf{i} - 80\omega_z\mathbf{j} + (260\omega_x + 80\omega_y)\mathbf{k}$$

Equate coefficients of unit vectors.

$$\omega_z = 0$$

$$7800 = 260\omega_x + 80\omega_y \quad (3)$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

$$\mathbf{v}_2 = \boldsymbol{\omega}\times\mathbf{r}_2 = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \omega_x & \omega_y & 0 \\ 80 & 50 & 0 \end{vmatrix} = (50\omega_x - 80\omega_y)\mathbf{k}$$

Recall from Eq. (2) that $\mathbf{v}_2 = 1000\mathbf{k}$, and write

$$1000 = 50\omega_x - 80\omega_y \qquad (4)$$

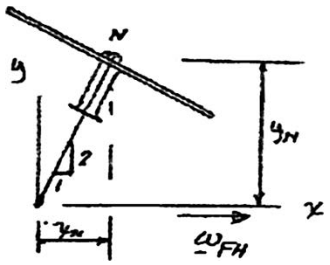
Add Eqs. (3) and (4): $8800 = 310\omega_x \qquad \omega_x = 28.387 \text{ rad/s}$

Eq. (4): $1000 = 50(28.387) - 80\omega_y \qquad \omega_y = 5.242 \text{ rad/s}$

(*a*) Common angular velocity of unit *AB*. $\boldsymbol{\omega} = (28.387 \text{ rad/s})\mathbf{i} + (5.242 \text{ rad/s})\mathbf{j}$

$$\boldsymbol{\omega} = (28.4 \text{ rad/s})\mathbf{i} + (5.24 \text{ rad/s})\mathbf{j} \blacktriangleleft$$

(*b*) Angular velocity of shaft *FH*. (See figure in text.)
Point *N* is at nut, which is a part of unit *AB* and also is a part of shaft *GH*.



$$x_N = \frac{1}{2}y_N$$

$$\mathbf{r}_N = x_N\mathbf{i} + y_N\mathbf{j}$$

$$\mathbf{r}_N = \frac{1}{2}y_N\mathbf{i} + y_N\mathbf{j}$$

Nut *N* as a part of unit *AB*: $\boldsymbol{\omega} = (28.387 \text{ rad/s})\mathbf{i} + (5.242 \text{ rad/s})\mathbf{j}$

$$\mathbf{v}_N = \boldsymbol{\omega}\times\mathbf{r}_N = (28.387\mathbf{i} + 5.242\mathbf{j})\times\left(\frac{1}{2}y_N\mathbf{i} + y_N\mathbf{j}\right)$$

$$\mathbf{v}_N = (28.387y_N - 2.621y_N)\mathbf{k} = +(25.766y_N)\mathbf{k} \qquad (5)$$

Nut *N* as a part of shaft *FH*. $\boldsymbol{\omega}_{FH} = \omega_{FH}\mathbf{i}$

$$\mathbf{v}_N = \boldsymbol{\omega}_{FH}\times\mathbf{r}_N = (\omega_{FH}\mathbf{i})\times\left(\frac{1}{2}y_N\mathbf{i} + y_N\mathbf{j}\right) = \omega_{FH}\,y_N\mathbf{k} \qquad (6)$$

Equating expressions for $\mathbf{v}_N$ from Eqs. (5) and (6),

$$+(25.766y_N)\mathbf{k} = \omega_{FH}\,y_N\mathbf{k}$$

$$\boldsymbol{\omega}_{FH} = (25.766 \text{ rad/s})\mathbf{i} \qquad \boldsymbol{\omega}_{FH} = (25.8 \text{ rad/s})\mathbf{i} \blacktriangleleft$$

PROBLEM 15.200

In Problem 15.199, determine (*a*) the common angular acceleration of gears *A* and *B*, (*b*) the acceleration of the tooth of gear *A* which is in contact with gear *C* at Point *I*.

SOLUTION

See the solution to part (*a*) of Problem 15.199 for the calculation of the common angular velocity of unit *AB*.

$$\boldsymbol{\omega} = (28.387 \text{ rad/s})\mathbf{i} + (5.242 \text{ rad/s})\mathbf{j}$$

The angular velocity vector ω rotates about the *x*-axis with angular velocity $\boldsymbol{\omega}_{FH}$. See part (*b*) of Problem 15.199 for the calculation of $\boldsymbol{\omega}_{FH}$.

$$\boldsymbol{\omega}_{FH} = (25.776 \text{ rad/s})\mathbf{i}$$

(*a*) Common angular acceleration of unit *AB*.

$$\begin{aligned}\boldsymbol{\alpha} &= \boldsymbol{\omega}_{FH} \times \boldsymbol{\omega} \\ &= (25.776\mathbf{i}) \times (28.387\mathbf{i} + 5.242\mathbf{j}) \\ &= 135.12\mathbf{k}\end{aligned}$$

$$\boldsymbol{\alpha} = 135.1 \text{ rad/s}^2\mathbf{k} \blacktriangleleft$$

The position and velocity vectors of a tooth at the contact Point 1 of gears *A* and *C* are

$$\begin{aligned}\mathbf{r}_1 &= -(80 \text{ mm})\mathbf{i} + (260 \text{ mm})\mathbf{j} \\ \mathbf{v}_1 &= (7800 \text{ mm/s})\mathbf{k}\end{aligned}$$

as determined in part (*a*) of Problem 15.199.

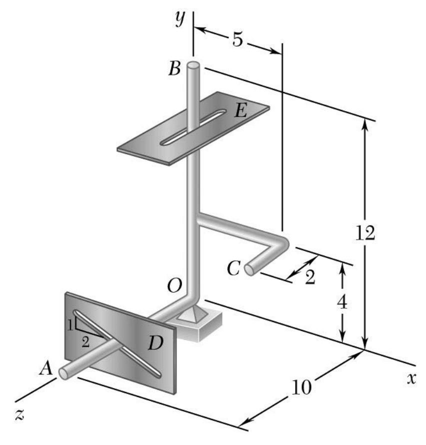
(*b*) Acceleration of the tooth at Point 1 of gear *A*.

$$\begin{aligned}\mathbf{a}_1 &= \boldsymbol{\alpha} \times \mathbf{r}_1 + \boldsymbol{\omega} \times \mathbf{v}_1 \\ &= (135.12\mathbf{k}) \times (-80\mathbf{i} + 260\mathbf{j}) + (28.387\mathbf{i} + 5.242\mathbf{j}) \times 7800\mathbf{k} \\ &= -10810\mathbf{j} - 35131\mathbf{i} - 221419\mathbf{j} + 40888\mathbf{i} \\ &= (5757 \text{ mm/s}^2)\mathbf{i} - (232229 \text{ mm/s}^2)\mathbf{j}\end{aligned}$$

$$\mathbf{a}_1 = (5.8 \text{ m/s}^2)\mathbf{i} - (232 \text{ m/s}^2)\mathbf{j} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. If you are a student using this Manual, you are using it without permission.*

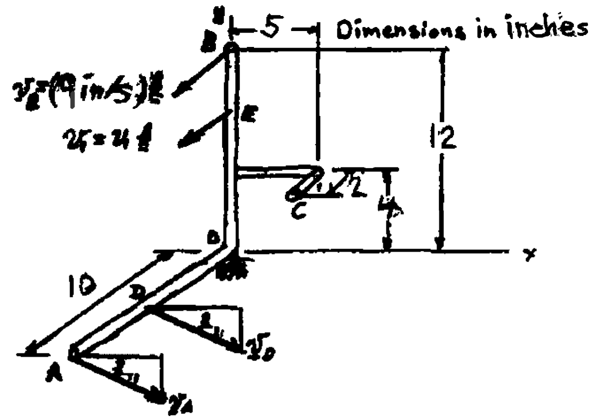
PROBLEM 15.201



Dimensions in in.

Several rods are brazed together to form the robotic guide arm shown which is attached to a ball-and-socket joint at *O*. Rod *OA* slides in a straight inclined slot while rod *OB* slides in a slot parallel to the *z* axis. Knowing that at the instant shown $\mathbf{v}_B = (9\text{ in./s})\mathbf{k}$, determine (*a*) the angular velocity of the guide arm, (*b*) the velocity of Point *A*, (*c*) the velocity of Point *C*.

SOLUTION



Since rod at *D* slides in slot which is of slope 1:2,

$$(v_D)_x = -2(v_D)_y$$

and

$$(v_A)_x = -2(v_A)_y$$

(*a*) Angular velocity.

$$\boldsymbol{\omega} = \omega_x\mathbf{i} + \omega_y\mathbf{j} + \omega_z\mathbf{k}$$

$$\mathbf{v}_B = \boldsymbol{\omega}\times\mathbf{r}_B: \quad (9\text{ in./s})\mathbf{k} = (\omega_x\mathbf{i} + \omega_y\mathbf{j} + \omega_z\mathbf{k})\times(12\text{ in.})\mathbf{j}$$

$$9\mathbf{k} = 12\omega_x\mathbf{k} - 12\omega_z\mathbf{i}$$

Coefficients of **k**: $9 = 12\omega_x \quad \omega_x = 0.75\text{ rad/s}$

Coefficients of **i**: $0 = -12\omega_z \quad \omega_z = 0$

$$\mathbf{v}_A = \boldsymbol{\omega}\times\mathbf{r}_A$$

$$\mathbf{v}_A = (0.75\mathbf{i} + \omega_y\mathbf{j})\times(10\mathbf{k})$$

$$(v_A)_x\mathbf{i} + (v_A)_y\mathbf{j} + (v_A)_z\mathbf{k} = -7.5\mathbf{j} + 10\omega_y\mathbf{i}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 15.201 (Continued)

Coefficients of **j**: $(v_A)_y = -7.5$

Coefficients of **i**: $(v_A)_x = 10\omega_y$

Coefficients of **k**: $(v_A)_z = 0$

Recall the Equations $(v_A)_x = -2(v_A)_y$

and $10\omega_y = -2(-7.5)$

So, $\omega_y = 1.5 \text{ rad/s}$ and $(v_A)_x = 15 \text{ in./s}$

$$\boldsymbol{\omega} = (0.75 \text{ rad/s})\mathbf{i} + (1.5 \text{ rad/s})\mathbf{j} \blacktriangleleft$$

(*b*) Velocity of *A*: $\mathbf{v}_A = (15 \text{ in./s})\mathbf{i} - (7.5 \text{ in./s})\mathbf{j} \blacktriangleleft$

(*c*) Velocity of *C*:

$$\mathbf{r}_C = 5\mathbf{i} + 4\mathbf{j} + 2\mathbf{k}$$

$$\mathbf{v}_C = \boldsymbol{\omega} \times \mathbf{r}_C$$

$$= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 0.75 & 1.5 & 0 \\ 5 & 4 & 2 \end{vmatrix}$$

$$= 3\mathbf{i} - 1.5\mathbf{j} + (3 - 7.5)\mathbf{k}$$

$$\mathbf{v}_C = (3 \text{ in./s})\mathbf{i} - (1.5 \text{ in./s})\mathbf{j} - (4.5 \text{ in./s})\mathbf{k} \blacktriangleleft$$

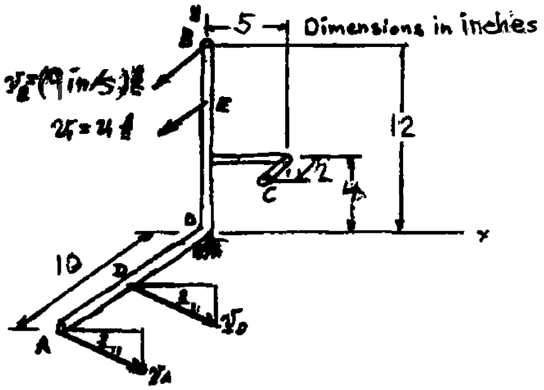
Dimensions in in.

PROBLEM 15.202

In Problem 15.201 the speed of Point B is known to be constant. For the position shown, determine (a) the angular acceleration of the guide arm, (b) the acceleration of Point C.

PROBLEM 15.201 Several rods are brazed together to form the robotic guide arm shown, which is attached to a ball-and-socket joint at O. Rod OA slides in a straight inclined slot while rod OB slides in a slot parallel to the z-axis. Knowing that at the instant shown $\mathbf{v}_B = (9 \text{ in./s})\mathbf{k}$, determine ($a$) the angular velocity of the guide arm, (b) the velocity of Point A, (c) the velocity of Point C.

SOLUTION



Since rod at D slides in slot which is of slope 1:2,

$$(v_D)_x = -2(v_D)_y$$

and

$$(v_A)_x = -2(v_A)_y$$

Angular velocity.

$$\boldsymbol{\omega} = \omega_x\mathbf{i} + \omega_y\mathbf{j} + \omega_z\mathbf{k}$$

$$\mathbf{v}_B = \boldsymbol{\omega}\times\mathbf{r}_B: \quad (9 \text{ in./s})\mathbf{k} = (\omega_x\mathbf{i} + \omega_y\mathbf{j} + \omega_z\mathbf{k})\times(12 \text{ in.})\mathbf{j}$$

$$9\mathbf{k} = 12\omega_x\mathbf{k} - 12\omega_z\mathbf{i}$$

Coefficients of **k**: $\quad 9 = 12\omega_x \quad \omega_x = 0.75 \text{ rad/s}$

Coefficients of **i**: $\quad 0 = -12\omega_z \quad \omega_z = 0$

$$\mathbf{v}_A = \boldsymbol{\omega}\times\mathbf{r}_A$$

$$\mathbf{v}_A = (0.75\mathbf{i} + \omega_y\mathbf{j})\times(10\mathbf{k})$$

$$(v_A)_x\mathbf{i} + (v_A)_y\mathbf{j} + (v_A)_z\mathbf{k} = -7.5\mathbf{j} + 10\omega_y\mathbf{i}$$

Coefficients of **j**: $\quad (v_A)_y = -7.5$

Coefficients of **i**: $\quad (v_A)_x = 10\omega_y$

Coefficients of **k**: $\quad (v_A)_z = 0$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. If you are a student using this Manual, you are using it without permission.*

Recall the Equations $(v_A)_x = -2(v_A)_y$

and $10\omega_y = -2(-7.5)$

So, $\omega_y = 1.5 \text{ rad/s}$ and $(v_A)_x = 15 \text{ in./s}$

$$\boldsymbol{\omega} = (0.75 \text{ rad/s})\mathbf{i} + (1.5 \text{ rad/s})\mathbf{j}$$

Velocity of A: $\mathbf{v}_A = (15 \text{ in./s})\mathbf{i} - (7.5 \text{ in./s})\mathbf{j}$

Velocity of C: $\mathbf{r}_C = 5\mathbf{i} + 4\mathbf{j} + 2\mathbf{k}$

$$\mathbf{v}_C = \boldsymbol{\omega} \times \mathbf{r}_C = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 0.75 & 1.5 & 0 \\ 5 & 4 & 2 \end{vmatrix} = 3\mathbf{i} - 1.5\mathbf{j} + (3 - 7.5)\mathbf{k}$$

$$\mathbf{v}_C = (3 \text{ in./s})\mathbf{i} - (1.5 \text{ in./s})\mathbf{j} - (4.5 \text{ in./s})\mathbf{k}$$

$$\mathbf{a}_B = \boldsymbol{\alpha} \times \mathbf{r}_B + \boldsymbol{\omega} \times (\boldsymbol{\omega} \times \mathbf{r}_C) = \boldsymbol{\alpha} \times \mathbf{r}_C + \boldsymbol{\omega} \times \mathbf{v}_B$$

$$\mathbf{a}_B = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \alpha_x & \alpha_y & \alpha_z \\ 0 & 12 & 0 \end{vmatrix} + \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 0.75 & 1.5 & 0 \\ 0 & 0 & 9 \end{vmatrix} = -12\alpha_z\mathbf{i} + 12\alpha_x\mathbf{k} + 13.5\mathbf{i} - 6.75\mathbf{j}$$

$$\mathbf{a}_B = (13.5 - 12\alpha_z)\mathbf{i} - 6.75\mathbf{j} + 12\alpha_x\mathbf{k} \quad (1)$$

$$(a_B)_x = 13.5 - 12\alpha_z = 0 \qquad \alpha_z = 1.125 \text{ rad/s}^2$$

$$(a_B)_y = -6.75 \qquad (a_B)_y = -6.75 \text{ in./s}^2$$

$$(a_B)_z = 12\alpha_x = 0 \qquad \alpha_x = 0$$

$$\mathbf{a}_A = \boldsymbol{\alpha} \times \mathbf{r}_A + \boldsymbol{\omega} \times (\boldsymbol{\omega} \times \mathbf{r}_A) = \boldsymbol{\alpha} \times \mathbf{r}_A + \boldsymbol{\omega} \times \mathbf{v}_A$$

$$\mathbf{a}_A = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 0 & \alpha_y & 1.125 \\ 0 & 0 & 10 \end{vmatrix} + \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 0.75 & 1.5 & 0 \\ 15 & -7.5 & 0 \end{vmatrix} = 10\alpha_y\mathbf{i} + (-5.625 - 22.5)\mathbf{k}$$

$$\mathbf{a}_A = 10\alpha_y\mathbf{i} - 28.125\mathbf{k}$$

Thus, $(a_A)_x = 10\alpha_y \quad (a_A)_y = 0 \quad (a_A)_z = -28.125 \text{ in./s}^2$

But $(a_A)_x = -2(a_A)_y = 0$

Therefore, $(a_A)_x = 10\alpha_y = 0 \quad \alpha_y = 0$

PROBLEM 15.203

Rod AB of length 25 in. is connected by ball-and-socket joints to collars A and B, which slide along the two rods shown. Knowing that collar B moves toward Point E at a constant speed of 20 in./s, determine the velocity of collar A as collar B passes through Point D.

SOLUTION

Geometry. $$l_{AB}^2 = x_{A/B}^2 + y_{A/B}^2 + z_{A/B}^2: \quad 25^2 = (-12)^2 + y_{A/B}^2 + (-20)^2$$

$$y_{A/B} = 9 \text{ in.}$$

$$\mathbf{r}_{A/B} = (-12 \text{ in.})\mathbf{i} + (9 \text{ in.})\mathbf{j} - (20 \text{ in.})\mathbf{k}$$

$$\mathbf{r}_{D/C} = (12 \text{ in.})\mathbf{i} - (9 \text{ in.})\mathbf{j},$$

$$l_{CD} = \sqrt{(12)^2 + (-9)^2} = 15 \text{ in.}$$

Velocity of collar B. $$\mathbf{v}_B = v_B \frac{r_{D/C}}{l_{CD}}$$

$$\mathbf{v}_B = (20)\frac{(12\mathbf{i} - 9\mathbf{j})}{15} = (16 \text{ in./s})\mathbf{i} - (12 \text{ in./s})\mathbf{j}$$

Velocity of collar A. $$\mathbf{v}_A = v_A \mathbf{j}$$

$$\mathbf{v}_A = \mathbf{v}_B + \mathbf{v}_{A/B}$$

where $$\mathbf{v}_{A/B} = \boldsymbol{\omega}_{AB} \times \mathbf{r}_{A/B}$$

Noting that $\mathbf{v}_{A/B}$ is perpendicular to $\mathbf{r}_{A/B}$, we get $\mathbf{r}_{B/A} \cdot \mathbf{v}_{B/A} = 0.$

Forming $\mathbf{r}_{A/B} \cdot \mathbf{v}_A$, we get $$\mathbf{r}_{A/B} \cdot \mathbf{v}_A = \mathbf{r}_{A/B} \cdot (\mathbf{v}_B + \mathbf{v}_{A/B})$$

$$= \mathbf{r}_{A/B} \cdot \mathbf{v}_B + \mathbf{r}_{A/B} \cdot \mathbf{v}_{A/B}$$

or $$\mathbf{r}_{A/B} \cdot \mathbf{v}_A = \mathbf{r}_{A/B} \cdot \mathbf{v}_B \qquad (1)$$

From Eq. (1), $$(-12\mathbf{i} + 9\mathbf{j} - 20\mathbf{k}) \cdot (v_A \mathbf{j}) = (-12\mathbf{i} + 9\mathbf{j} - 80\mathbf{k}) \cdot (16\mathbf{i} - 12\mathbf{j})$$

$$9v_A = (-12)(16) + (9)(-12)$$

or $$v_A = -33.333 \text{ in./s} \qquad \mathbf{v}_A = -(33.3 \text{ in./s})\mathbf{j} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. PROBLEM 15.204

Rod AB, of length 11 in., is connected by ball-and-socket joints to collars A and B, which slide along the two rods shown. Knowing that collar B moves downward at a constant speed of 54 in./s, determine the velocity of collar A when $c = 2$ in.

SOLUTION

Geometry. $l_{AB}^2 = x_{A/B}^2 + y_{A/B}^2 + z_{A/B}^2: \quad (11)^2 = (6)^2 + (-2)^2 + (z_{A/B})^2$

$z_{A/B} = 9 \text{ in.} \quad \mathbf{r}_{A/B} = (-6 \text{ in.})\mathbf{i} - (2 \text{ in.})\mathbf{j} + (9 \text{ in.})\mathbf{k}$

Velocity of collar B. $\mathbf{v}_B = -v_B\mathbf{j} = -(54 \text{ in./s})\mathbf{j}$

Velocity of collar A. $\mathbf{v}_A = v_A\mathbf{k}$

$\mathbf{v}_A = \mathbf{v}_B + \mathbf{v}_{A/B},$

where $\mathbf{v}_{A/B} = \boldsymbol{\omega}_{AB} \times \mathbf{r}_{A/B}$

Noting that $\mathbf{v}_{A/B}$ is perpendicular to $\mathbf{r}_{A/B}$, we get $\mathbf{r}_{B/A} \cdot \mathbf{v}_{B/A} = 0.$

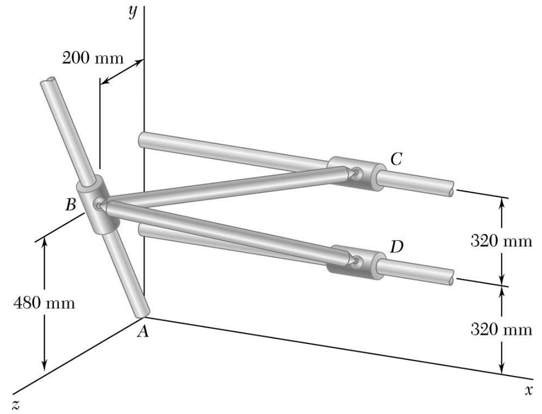
Forming $\mathbf{r}_{A/B} \cdot \mathbf{v}_A$, we get $\mathbf{r}_{A/B} \cdot \mathbf{v}_A = \mathbf{r}_{A/B} \cdot (\mathbf{v}_B + \mathbf{v}_{A/B}) = \mathbf{r}_{A/B} \cdot \mathbf{v}_B + \mathbf{r}_{A/B} \cdot \mathbf{v}_{A/B}$

or $\mathbf{r}_{A/B} \cdot \mathbf{v}_A = \mathbf{r}_{A/B} \cdot \mathbf{v}_B \quad (1)$

From Eq. (1), $(-6\mathbf{i} - 2\mathbf{j} + 9\mathbf{k}) \cdot v_A\mathbf{k} = (-6\mathbf{i} - 2\mathbf{j} + 9\mathbf{k}) \cdot (-54\mathbf{j})$

or $9v_A = 108$ $\qquad \mathbf{v}_A = (12.00 \text{ in./s})\mathbf{k}$ ◀

If you are a student using this Manual, you are using it without permission.*



PROBLEM 15.205

Rods *BC* and *BD* are each 840 mm long and are connected by ball-and-socket joints to collars which may slide on the fixed rods shown. Knowing that collar *B* moves toward *A* at a constant speed of 390 mm/s, determine the velocity of collar *C* for the position shown.

SOLUTION

Geometry.

$$l_{BC}^2 = x_{C/B}^2 + y_{C/B}^2 + z_{C/B}^2$$

$$(840)^2 = c^2 + (640-480)^2 + (200)^2 \qquad c = 800 \text{ mm}$$

$$\mathbf{r}_{C/B} = (800 \text{ mm})\mathbf{i} + (160 \text{ mm})\mathbf{j} - (200 \text{ mm})\mathbf{k}$$

Velocity of B.

$$\mathbf{v}_B = v_B\left(-\frac{12}{13}\mathbf{j} - \frac{5}{13}\mathbf{k}\right)$$

$$= (390 \text{ mm/s})\left(-\frac{12}{13}\mathbf{j} - \frac{5}{13}\mathbf{k}\right)$$

$$= -(360 \text{ mm/s})\mathbf{j} - (150 \text{ mm/s})\mathbf{k}$$

Velocity of C.

$$\mathbf{v}_C = v_C\mathbf{i}$$

$$\mathbf{v}_C = \mathbf{v}_B + \mathbf{v}_{C/B}$$

where

$$\mathbf{v}_{C/B} = \boldsymbol{\omega}_{BC} \times \mathbf{r}_{C/B}$$

Noting that $\mathbf{v}_{C/B}$ is perpendicular to $\mathbf{r}_{C/B}$, we get $\mathbf{r}_{C/B} \cdot \mathbf{v}_{C/B} = 0$

So that

$$\mathbf{r}_{C/B} \cdot \mathbf{v}_C = \mathbf{r}_{C/B} \cdot \mathbf{v}_B$$

$$(800\mathbf{i} + 160\mathbf{j} - 200\mathbf{k}) \cdot (-360\mathbf{j} - 150\mathbf{k}) = (800\mathbf{i} + 160\mathbf{j} - 200\mathbf{k}) \cdot (v_C\mathbf{i})$$

$$(160)(-360) + (-200)(-150) = 800\, v_C$$

$$v_C = -34.5 \text{ mm/s} \qquad \mathbf{v}_C = -(34.5 \text{ mm/s})\mathbf{i} \blacktriangleleft$$

Velocity of collar B.
$$\mathbf{v}_B = v_B \frac{\mathbf{r}_{D/C}}{l_{CD}}$$

$$\mathbf{v}_B = \frac{(50)(90\mathbf{i} - 180\mathbf{k})}{201.246}$$
$$= (22.3607 \text{ mm/s})\mathbf{i} - (44.7214 \text{ mm/s})\mathbf{k}$$

Velocity of collar A.
$$\mathbf{v}_A = v_A \mathbf{j}$$
$$\mathbf{v}_A = \mathbf{v}_B + \mathbf{v}_{A/B}$$

where
$$\mathbf{v}_{A/B} = \boldsymbol{\omega}_{AB} \times \mathbf{r}_{A/B}$$

Noting that $\mathbf{v}_{A/B}$ is perpendicular to $\mathbf{r}_{A/B}$, we get $\mathbf{r}_{B/A} \cdot \mathbf{v}_{B/A} = 0.$

Forming $\mathbf{r}_{A/B} \cdot \mathbf{v}_A$, we get
$$\mathbf{r}_{A/B} \cdot \mathbf{v}_A = \mathbf{r}_{A/B} \cdot (\mathbf{v}_B + \mathbf{v}_{A/B})$$
$$= \mathbf{r}_{A/B} \cdot \mathbf{v}_B + \mathbf{r}_{A/B} \cdot \mathbf{v}_{A/B}$$

or
$$\mathbf{r}_{A/B} \cdot \mathbf{v}_A = \mathbf{r}_{A/B} \cdot \mathbf{v}_B \qquad (1)$$

From Eq. (1), $(-60\mathbf{i} + 287.75\mathbf{j} - 60\mathbf{k}) \cdot (v_A\mathbf{j}) = (-60\mathbf{i} + 287.75\mathbf{j} - 60\mathbf{k}) \cdot (22.3607\mathbf{i} - 44.7214\mathbf{j})$

$$287.75 v_A = (-60)(22.3607) + (-60)(-44.7214)$$

or
$$v_A = 4.6626 \text{ mm/s}$$

$\mathbf{v}_A = (4.66 \text{ mm/s})\mathbf{j}$ ◀

PROBLEM 15.210

Two shafts *AC* and *EG*, which lie in the vertical *yz* plane, are connected by a universal joint at *D*. Shaft *AC* rotates with a constant angular velocity ω_1 as shown. At a time when the arm of the crosspiece attached to shaft *AC* is vertical, determine the angular velocity of shaft *EG*.

SOLUTION

Angular velocity of shaft AC. $\boldsymbol{\omega}_{AC} = \omega_1 \mathbf{k}$

Let $\omega_3 \mathbf{j}$ be the angular velocity of body *D* relative to shaft *AD*.

Angular velocity of body D. $\boldsymbol{\omega}_D = \omega_1 \mathrm{k} + \omega_3 \mathbf{j}$

Angular velocity of shaft EG. $\boldsymbol{\omega}_{EG} = \omega_2 (\cos 25° \mathbf{k} - \sin 25° \mathbf{j})$

Let $\omega_4 \mathbf{i}$ be the angular velocity of body *D* relative to shaft *EG*.

Angular velocity of body D. $\boldsymbol{\omega}_D = \omega_2 (\cos 25° \mathbf{k} - \sin 25° \mathbf{j}) + \omega_4 \mathbf{i}$

Equate the two expressions for ω_D and resolve into components.

$$\mathbf{i}: \quad 0 = \omega_4 \tag{1}$$

$$\mathbf{j}: \quad \omega_3 = -\omega_2 \sin 25° \tag{2}$$

$$\mathbf{k}: \quad \omega_1 = \omega_2 \cos 25° \tag{3}$$

From Eq. (3), $\omega_2 = \dfrac{\omega_1}{\cos 25°}$ $\quad \boldsymbol{\omega}_{EG} = \dfrac{\omega_2}{\cos 25°}(-\sin 25° \mathbf{j} + \cos 25° \mathbf{k})$ ◀

PROBLEM 15.211

Solve Problem 15.210, assuming that the arm of the crosspiece attached to the shaft *AC* is horizontal.

PROBLEM 15.210 Two shafts *AC* and *EG*, which lie in the vertical *yz* plane, are connected by a universal joint at *D*. Shaft *AC* rotates with a constant angular velocity ω_1 as shown. At a time when the arm of the crosspiece attached to shaft *AC* is vertical, determine the angular velocity of shaft *EG*.

SOLUTION

Angular velocity of shaft AC. $\boldsymbol{\omega}_{AC} = \omega_1 \mathbf{k}$

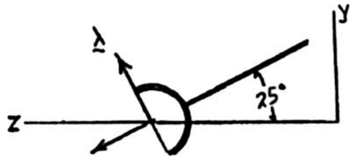
Let $\omega_3 \mathbf{i}$ be the angular velocity of body *D* relative to shaft *AD*.

Angular velocity of body D. $\boldsymbol{\omega}_D = \omega_1 \mathbf{k} + \omega_3 \mathbf{i}$

Angular velocity of shaft EG. $\boldsymbol{\omega}_{EG} = \omega_2 (\cos 25° \mathbf{k} - \sin 25° \mathbf{j})$

Let $\omega_4 \boldsymbol{\lambda}$ be the angular velocity of body *D* relative to shaft *EG*,

where $\boldsymbol{\lambda}$ is a unit vector along the clevis axle attached to shaft *EG*.



$$\boldsymbol{\lambda} = \cos 25° \mathbf{j} + \sin 25° \mathbf{k}$$

$$\omega_4 \boldsymbol{\lambda} = \omega_4 \cos 25° \mathbf{j} + \omega_4 \sin 25° \mathbf{k}$$

Angular velocity of body D.

$$\boldsymbol{\omega}_D = \boldsymbol{\omega}_{EG} + \omega_4 \boldsymbol{\lambda}$$

$$\boldsymbol{\omega}_D = (\omega_4 \cos 25° - \omega_2 \sin 25°)\mathbf{j} + (\omega_4 \sin 25° + \omega_2 \cos 25°)\mathbf{k}$$

Equate the two expressions for $\boldsymbol{\omega}_D$ and resolve into components.

$$\mathbf{i}: \quad \omega_3 = 0 \qquad (1)$$

$$\mathbf{j}: \quad 0 = \omega_4 \cos 25° - \omega_2 \sin 25° \qquad (2)$$

$$\mathbf{k}: \quad \omega_1 = \omega_4 \sin 25° + \omega_2 \cos 25° \qquad (3)$$

From Eqs. (2) and (3), $\omega_2 = \omega_1 \cos 25°$ $\quad \boldsymbol{\omega}_{EG} = \omega_1 \cos 25°(-\sin 25° \mathbf{j} + \cos 25° \mathbf{k})$ ◀

PROBLEM 15.212

In Problem 15.206, the ball-and-socket joint between the rod and collar A is replaced by the clevis shown. Determine (a) the angular velocity of the rod, (b) the velocity of collar A.

SOLUTION

Geometry. $\mathbf{r}_{B/C} = (8 \text{ in.})\mathbf{k} \quad \mathbf{r}_{A/B} = -(25 \text{ in.})\mathbf{i} + (20 \text{ in.})\mathbf{j} - (8 \text{ in.})\mathbf{k}$

Velocity of collar B. $\mathbf{v}_B = \omega_0 \mathbf{j} \times \mathbf{r}_{B/C} = -3\mathbf{j} \times 8\mathbf{k} = (24 \text{ in./s})\mathbf{i}$

Velocity of collar A. $\mathbf{v}_A = \mathbf{v}_A \mathbf{j}$

Angular velocity of collar A. $\boldsymbol{\omega}_A = \omega_1 \mathbf{j}$

The axle of the clevis at A is perpendicular to both the y axis and the rod AB. A vector $\mathbf{p}$ along this axle is

$$\mathbf{p} = \mathbf{j} \times \mathbf{r}_{A/B} = \mathbf{j} \times (-25\mathbf{i} + 20\mathbf{j} - 8\mathbf{k}) = -8\mathbf{i} + 25\mathbf{k}$$

$$p = \sqrt{8^2 + 25^2} = 26.2488$$

Unit vector $\boldsymbol{\lambda}$ along axle: $\boldsymbol{\lambda} = \dfrac{\mathbf{p}}{p} = -0.30478\mathbf{i} + 0.95242\mathbf{k}$

Let $\boldsymbol{\omega}_2$ be the angular velocity of the rod AB relative to collar A.

$$\boldsymbol{\omega}_2 = \omega_2 \boldsymbol{\lambda} = -0.30478\omega_2 \mathbf{i} + 0.95242\omega_2 \mathbf{k}$$

Angular velocity of rod AB. $\boldsymbol{\omega}_{AB} = \boldsymbol{\omega}_A + \boldsymbol{\omega}_2$

$$\boldsymbol{\omega}_{AB} = -0.30478\omega_2 \mathbf{i} + \omega_1 \mathbf{j} + 0.95242\omega_2 \mathbf{k} \qquad (1)$$

$$\mathbf{v}_A = \mathbf{v}_B + \mathbf{v}_{A/B} = \mathbf{v}_B + \boldsymbol{\omega}_{AB} \times \mathbf{r}_{A/B}$$

$$\mathbf{v}_A \mathbf{j} = 24\mathbf{i} + \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -0.30478\omega_2 & \omega_1 & 0.95242\omega_2 \\ -25 & 20 & -8 \end{vmatrix}$$

Resolving into components,

$$\mathbf{i}: \quad 0 = 24 - 8\omega_1 - 19.0484\omega_2 \qquad (2)$$

$$\mathbf{j}: \quad v_A = -26.2487\omega_2 \qquad (3)$$

$$\mathbf{k}: \quad 0 = 25\omega_1 - 6.0956\omega_2 \qquad (4)$$

PROBLEM 15.213

In Problem 15.205, the ball-and-socket joint between the rod and collar C is replaced by the clevis connection shown. Determine (a) the angular velocity of the rod, (b) the velocity of collar C.

SOLUTION

Geometry. $\mathbf{r}_C = x_C\mathbf{i} + (640 \text{ mm})\mathbf{j}, \; \mathbf{r}_B = (480 \text{ mm})\mathbf{j} + (200 \text{ mm})\mathbf{k}$

$$l_{AB} = \sqrt{480^2 + 200^2} = 520 \text{ mm}$$

$$\mathbf{r}_{C/B} = x_C\mathbf{i} + (160 \text{ mm})\mathbf{j} - (200 \text{ mm})\mathbf{k}$$

Length of rod BC. $l_{BC}^2 = 840^2 = x_C^2 + 160^2 + 200^2$

Solving for x_C, $x_C = 800$ mm

$$\mathbf{r}_{C/B} = (800 \text{ mm})\mathbf{i} + (160 \text{ mm})\mathbf{j} - (200 \text{ mm})\mathbf{k}$$

Velocity. $\mathbf{v}_B = \dfrac{390}{520}(-480\mathbf{j} - 200\mathbf{k}) = (-360 \text{ mm})\mathbf{j} - (150 \text{ mm/s})\mathbf{k}$

$$\mathbf{v}_C = v_C\mathbf{i}$$

Angular velocity of collar C. $\boldsymbol{\omega}_C = \omega_C\mathbf{i}$

The axle of the clevis at C is perpendicular to the x-axis and to the rod BC.

A vector along this axle is $\mathbf{p} = \mathbf{i} \times \mathbf{r}_{C/B}$

$$\mathbf{p} = \mathbf{i} \times (800\mathbf{i} + 160\mathbf{j} - 200\mathbf{k}) = (200 \text{ mm})\mathbf{j} + (160 \text{ mm})\mathbf{k}$$

$$p = \sqrt{200^2 + 160^2} = 256.125 \text{ mm}$$

Let $\boldsymbol{\lambda}$ be a unit vector along the axle. $\boldsymbol{\lambda} = \dfrac{\mathbf{p}}{p} = 0.78087\mathbf{j} + 0.62470\mathbf{k}$

Let $\boldsymbol{\omega}_s = \omega_s\boldsymbol{\lambda}$ be the angular velocity of rod BC relative to collar C.

$$\boldsymbol{\omega}_s = 0.78087\omega_s\mathbf{j} + 0.62470\omega_s\mathbf{k}$$

Angular velocity of rod BC. $\boldsymbol{\omega}_{BC} = \boldsymbol{\omega}_C + \boldsymbol{\omega}_s$

$$\boldsymbol{\omega}_{BC} = \omega_C\mathbf{i} + 0.78087\omega_s\mathbf{j} + 0.62470\omega_s\mathbf{k}$$

$$\mathbf{v}_C = \mathbf{v}_B + \boldsymbol{\omega}_{BC} \times \mathbf{r}_{C/B}$$

$$v_C\mathbf{i} = -360\mathbf{j} - 150\mathbf{k} + \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \omega_C & 0.78087\omega_s & 0.62470\omega_s \\ 800 & 160 & -200 \end{vmatrix}$$

PROBLEM 15.214

In Problem 15.204, determine the acceleration of collar A when $c = 2$ in.

PROBLEM 15.204 Rod AB of length 11 in., is connected by ball-and-socket joints to collars A and B, which slide along the two rods shown. Knowing that collar B moves downward at a constant speed of 54 in./s, determine the velocity of collar A when $c = 2$ in.

SOLUTION

Geometry. $$l_{AB}^2 = x_{A/B}^2 + y_{A/B}^2 + z_{A/B}^2: \quad (11)^2 = (6)^2 + (-2)^2 + (z_{A/B})^2$$

$$z_{A/B} = 9 \text{ in.} \quad \mathbf{r}_{A/B} = (-6 \text{ in.})\mathbf{i} - (2 \text{ in.})\mathbf{j} + (9 \text{ in.})\mathbf{k}$$

Velocity of collar B. $$\mathbf{v}_B = -v_B\mathbf{j} = -(54 \text{ in./s})\mathbf{j}$$

$$\mathbf{v}_B = \frac{(2.5)(4.5\mathbf{i} - 9\mathbf{k})}{10.0623} = (1.11803 \text{ in.})\mathbf{i} - (2.23607 \text{ in./s})\mathbf{k}$$

Velocity of collar A. $$\mathbf{v}_A = v_A\mathbf{k}$$

$$\mathbf{v}_A = \mathbf{v}_B + \mathbf{v}_{A/B},$$

where $$\mathbf{v}_{A/B} = \boldsymbol{\omega}_{AB} \times \mathbf{r}_{A/B}$$

Noting that $\mathbf{v}_{A/B}$ is perpendicular to $\mathbf{r}_{A/B}$, we get $\mathbf{r}_{B/A} \cdot \mathbf{v}_{B/A} = 0$

Forming $\mathbf{r}_{A/B} \cdot \mathbf{v}_A$, we get $$\mathbf{r}_{A/B} \cdot \mathbf{v}_A = \mathbf{r}_{A/B} \cdot (\mathbf{v}_B + \mathbf{v}_{A/B}) = \mathbf{r}_{A/B} \cdot \mathbf{v}_B + \mathbf{r}_{A/B} \cdot \mathbf{v}_{A/B}$$

or $$\mathbf{r}_{A/B} \cdot \mathbf{v}_A = \mathbf{r}_{A/B} \cdot \mathbf{v}_B \qquad (1)$$

From Eq. (1), $$(-6\mathbf{i} - 2\mathbf{j} + 9\mathbf{k}) \cdot v_A\mathbf{k} = (-6\mathbf{i} - 2\mathbf{j} + 9\mathbf{k}) \cdot (-54\mathbf{j})$$

or $$9v_A = 108 \qquad v_A = (12.00 \text{ in./s})\mathbf{k}$$

Relative velocity $$\mathbf{v}_{A/B} = \mathbf{v}_A - \mathbf{v}_B$$

$$\mathbf{v}_{A/B} = (54 \text{ in./s})\mathbf{j} + (12.00 \text{ in./s})\mathbf{k}$$

$$(v_{A/B})^2 = (54)^2 + (12.00)^2 = 3060 \text{ in}^2/\text{s}^2$$

Acceleration of collar B. $$\mathbf{a}_B = 0$$

Acceleration of collar A. $$\mathbf{a}_A = a_A\mathbf{k}$$

$$\mathbf{a}_A = \mathbf{a}_B + \mathbf{a}_{A/B}$$

where $$\mathbf{a}_{A/B} = \boldsymbol{\alpha}_{AB} \times \mathbf{r}_{A/B} + \boldsymbol{\omega}_{AB} \times \mathbf{v}_{A/B}$$

Noting that $\boldsymbol{\alpha}_{AB} \times \mathbf{r}_{A/B}$ is perpendicular to $\mathbf{r}_{A/B}$, we get $\mathbf{r}_{A/B} \cdot \boldsymbol{\alpha}_{AB} \times \mathbf{r}_{A/B} = 0$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 15.214 (Continued)

We note also that

$$\mathbf{r}_{A/B} \cdot \boldsymbol{\omega}_{AB} \times \mathbf{v}_{A/B} = \mathbf{v}_{A/B} \cdot \mathbf{r}_{A/B} \times \boldsymbol{\omega}_{A/B}$$
$$= -\mathbf{v}_{A/B} \cdot \mathbf{v}_{A/B} = -(v_{A/B})^2$$

Then,

$$\mathbf{r}_{A/B} \cdot \mathbf{a}_{A/B} = 0 - (v_{A/B})^2 = -(v_{A/B})^2$$

Forming $\mathbf{r}_{A/B} \cdot \mathbf{a}_A$, we get

$$\mathbf{r}_{A/B} \cdot \mathbf{a}_A = \mathbf{r}_{A/B} \cdot (\mathbf{a}_A + \mathbf{a}_{A/B}) = \mathbf{r}_{A/B} \cdot \mathbf{a}_B + \mathbf{r}_{A/B} \cdot \mathbf{a}_{A/B}$$

or

$$\mathbf{r}_{A/B} \cdot \mathbf{a}_A = \mathbf{r}_{A/B} \cdot \mathbf{a}_B - (v_{A/B})^2 \qquad (2)$$

From Eq. (2)

$$(-6\mathbf{i} - 2\mathbf{i} + 9\mathbf{k}) \cdot a_A\mathbf{k} = 0 - 3060$$

$$9a_A = -3060 \qquad \mathbf{a}_A = -(340 \text{ in./s}^2)\mathbf{k} \blacktriangleleft$$

PROBLEM 15.215

In Problem 15.205, determine the acceleration of collar C.

PROBLEM 15.205 Rod BC and BD are each 840 mm long and are connected by ball-and-socket joints to collars which may slide on the fixed rods shown. Knowing that collar B moves toward A at a constant speed of 390 mm/s, determine the velocity of collar C for the position shown.

SOLUTION

Geometry.

$$l_{BC}^2 = x_{C/B}^2 + y_{C/B}^2 + z_{C/B}^2$$

$$(840)^2 = c^2 + (640-480)^2 + (200)^2 \qquad c = 800m$$

$$\mathbf{r}_{C/B} = (800 \text{ mm})\mathbf{i} + (160 \text{ mm})\mathbf{j} - (200 \text{ mm})\mathbf{k}$$

Velocity of B.

$$\mathbf{v}_B = v_B\left(-\frac{12}{13}\mathbf{j} - \frac{5}{13}\mathbf{k}\right)$$

$$= (390 \text{ mm/s})\left(-\frac{12}{13}\mathbf{j} - \frac{5}{13}\mathbf{k}\right)$$

$$= -(360 \text{ mm/s})\mathbf{j} - (150 \text{ mm/s})\mathbf{k}$$

Velocity of C.

$$\mathbf{v}_C = v_C\mathbf{i}$$

where

$$\mathbf{v}_C = \mathbf{v}_B + \mathbf{v}_{C/B}$$

$$\mathbf{v}_{C/B} = \boldsymbol{\omega}_{BC} \times \mathbf{r}_{C/B}$$

Noting that $\mathbf{v}_{C/B}$ is perpendicular to $\mathbf{r}_{C/B}$, we get $\mathbf{r}_{C/B} \cdot \mathbf{v}_C = \mathbf{r}_{C/B} \cdot \mathbf{v}_B$

$$(800\mathbf{i} + 160\mathbf{j} - 200\mathbf{k}) \cdot (-360\mathbf{j} + 150\mathbf{k}) = (800\mathbf{i} + 160\mathbf{j} - 200\mathbf{k}) \cdot (v_C\mathbf{i})$$

$$(160)(-360) + (-200)(-150) = 800v_C$$

$$v_C = -34.5 \text{ mm/s} \qquad \mathbf{v}_C = -(34.5 \text{ mm/s})\,\mathbf{i}$$

Relative velocity:

$$\mathbf{v}_{C/B} = \mathbf{v}_C - \mathbf{v}_B$$

$$\mathbf{v}_{C/B} = -(34.5 \text{ mm/s})\mathbf{i} + (360 \text{ mm/s})\mathbf{j} + (150 \text{ mm/s})\mathbf{k}$$

$$v_{C/B}^2 = (34.5)^2 + (360)^2 + (150)^2 = 153290 \text{ mm}^2/\text{s}^2$$

Acceleration of collar B:

$$\mathbf{a}_B = 0$$

Acceleration of collar C:

$$\mathbf{a}_C = \mathbf{a}_C\mathbf{i}$$

$$\mathbf{a}_C = \mathbf{a}_B + \mathbf{a}_{C/B}$$

where $\mathbf{a}_{C/B} = \boldsymbol{\alpha}_{CB} \times \mathbf{r}_{C/B} + \boldsymbol{\omega}_{CB} \times \mathbf{v}_{C/B}$

Noting that $\boldsymbol{\alpha}_{CB} \times \mathbf{r}_{C/B}$ is perpendicular to $\mathbf{r}_{C/B}$, we get $\mathbf{r}_{C/B} \cdot \boldsymbol{\alpha}_{CB} \times \mathbf{r}_{C/B} = 0$

We note also that

$$\mathbf{r}_{B/C} \cdot \boldsymbol{\omega}_{CB} \times \mathbf{v}_{C/B} = \mathbf{v}_{C/B} \cdot \mathbf{r}_{C/B} \times \boldsymbol{\omega}_{C/B}$$

$$= -\mathbf{v}_{C/B} \cdot \mathbf{v}_{C/B} = -(v_{C/B})^2$$

Then,

$$\mathbf{r}_{C/B} \cdot \mathbf{a}_C = 0 - (v_{C/B})^2 = -(v_{C/B})^2$$

Forming $\mathbf{r}_{C/B} \cdot \mathbf{a}_C$, we get

$$\mathbf{r}_{C/B} \cdot \mathbf{a}_C = \mathbf{r}_{C/B} \cdot (\mathbf{a}_B + \mathbf{a}_{C/B}) = \mathbf{r}_{B/C} \cdot \mathbf{a}_B + \mathbf{r}_{B/C} \cdot \mathbf{a}_{C/B}$$

so that

$$\mathbf{r}_{C/B} \cdot \mathbf{a}_C = \mathbf{r}_{C/B} \cdot \mathbf{a}_B - (v_{C/B})^2 \qquad (2)$$

From Equation (2),

$$(800\mathbf{i} + 160\mathbf{j} - 200\mathbf{k}) \cdot a_C\mathbf{i} = 0 - 153290$$

$$800a_C = -153290$$

$$a_C = -191.6 \text{ mm/s}^2 \qquad \mathbf{a}_C = -(191.6 \text{ mm/s}^2)\mathbf{i} \ ◀$$

PROBLEM 15.216

In Problem 15.206, determine the acceleration of collar A.

PROBLEM 15.206 Rod AB is connected by ball-and-socket joints to collar A and to the 16-in.-diameter disk C. Knowing that disk C rotates counterclockwise at the constant rate $\omega_0 = 3$ rad/s in the zx plane, determine the velocity of collar A for the position shown.

SOLUTION

Geometry.

$$\mathbf{r}_{B/C} = (-8 \text{ in.})\mathbf{k}$$

$$\mathbf{r}_{A/B} = -(25 \text{ in.})\mathbf{i} + (20 \text{ in.})\mathbf{j} - (8 \text{ in.})\mathbf{k}$$

Velocity at B.

$$\mathbf{v}_B = \omega_0 \mathbf{j} \times \mathbf{r}_{B/C}$$

$$= 3\mathbf{j} \times (-8\mathbf{k})$$

$$= (24 \text{ in./s})\mathbf{i}$$

Velocity of collar A.

$$\mathbf{v}_A = v_A \mathbf{j}$$

$$\mathbf{v}_A = \mathbf{v}_B + \mathbf{v}_{A/B}$$

where

$$\mathbf{v}_{A/B} = \boldsymbol{\omega}_{AB} \times \mathbf{r}_{A/B}$$

Noting that $\mathbf{v}_{A/B}$ is perpendicular to $\mathbf{r}_{A/B}$, we get $\mathbf{r}_{B/A} \cdot \mathbf{v}_{B/A} = 0.$

Forming $\mathbf{r}_{A/B} \cdot \mathbf{v}_A$, we get

$$\mathbf{r}_{A/B} \cdot \mathbf{v}_A = \mathbf{r}_{A/B} \cdot (\mathbf{v}_B + \mathbf{v}_{A/B})$$

$$= \mathbf{r}_{A/B} \cdot \mathbf{v}_B + \mathbf{r}_{A/B} \cdot \mathbf{v}_{A/B}$$

or

$$\mathbf{r}_{A/B} \cdot \mathbf{v}_A = \mathbf{r}_{A/B} \cdot \mathbf{v}_B \qquad (1)$$

From Eq. (1)

$$(-25\mathbf{i} + 20\mathbf{j} - 8\mathbf{k}) \cdot (v_A \mathbf{j}) = (-25\mathbf{i} + 20\mathbf{j} - 8\mathbf{k}) \cdot (24\mathbf{i})$$

$$20 v_A = -600$$

or

$$v_A = -30 \text{ in./s}$$

Relative velocity.

$$\mathbf{v}_{A/B} = \mathbf{v}_A - \mathbf{v}_B$$

$$\mathbf{v}_{A/B} = (-30 \text{ in./s})\mathbf{j} + (24 \text{ in./s})\mathbf{i}$$

$$(v_{A/B})^2 = (-30)^2 + (24)^2$$

$$= 1476 \text{ in}^2/\text{s}^2$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. If you are a student using this Manual, you are using it without permission.*

Acceleration at B.

$$\mathbf{a}_B = \omega_0 \mathbf{j} \times \mathbf{v}_B$$
$$= 3\mathbf{j} \times 24\mathbf{i}$$
$$= -(72 \text{ in./s}^2)\mathbf{k}$$

Acceleration of collar A.

$$\mathbf{a}_A = a_A \mathbf{j}$$
$$\mathbf{a}_A = \mathbf{a}_B + \mathbf{a}_{A/B}$$

where $\mathbf{a}_{A/B} = \boldsymbol{\alpha}_{AB} \times \mathbf{r}_{A/B} + \boldsymbol{\omega}_{AB} \times \mathbf{v}_{A/B}$

Noting that $\boldsymbol{\alpha}_{AB} \times \mathbf{r}_{A/B}$ is perpendicular to $\mathbf{r}_{A/B}$, we get $\mathbf{r}_{A/B} \cdot \boldsymbol{\alpha}_{AB} \times \mathbf{r}_{A/B} = 0$

We note also that

$$\mathbf{r}_{A/B} \cdot \boldsymbol{\omega}_{AB} \times \mathbf{v}_{A/B} = \mathbf{v}_{A/B} \cdot \mathbf{r}_{A/B} \times \boldsymbol{\omega}_{A/B}$$
$$= -\mathbf{v}_{A/B} \cdot \mathbf{v}_{A/B}$$
$$= -(v_{A/B})^2$$

Then

$$\mathbf{r}_{A/B} \cdot \mathbf{a}_{A/B} = 0 - (v_{A/B})^2$$
$$= -(v_{A/B})^2$$

Forming $\mathbf{r}_{A/B} \cdot \mathbf{a}_A$, we get

$$\mathbf{r}_{A/B} \cdot \mathbf{a}_A = \mathbf{r}_{A/B} \cdot (\mathbf{a}_A + \mathbf{a}_{A/B})$$
$$= \mathbf{r}_{A/B} \cdot \mathbf{a}_B + \mathbf{r}_{A/B} \cdot \mathbf{a}_{A/B}$$

or

$$\mathbf{r}_{A/B} \cdot \mathbf{a}_A = \mathbf{r}_{A/B} \cdot \mathbf{a}_B - (v_{A/B})^2 \qquad (2)$$

From Eq. (2),

$$(-25\mathbf{i} + 20\mathbf{j} - 8\mathbf{k}) \cdot (a_A \mathbf{j}) = (-25\mathbf{i} + 20\mathbf{j} - 8\mathbf{k}) \cdot (-72\mathbf{k}) - 1476$$
$$20a_A = 576 - 1476$$
$$= -45 \text{ in./s}^2$$

$$\mathbf{a}_A = -(45.0 \text{ in./s}^2)\mathbf{j} \blacktriangleleft$$

PROBLEM 15.217

In Problem 15.207, determine the acceleration of collar *A*.

PROBLEM 15.207 Rod *AB* of length 29 in. is connected by ball-and-socket joints to the rotating crank *BC* and to the collar *A*. Crank *BC* is of length 8 in. and rotates in the horizontal *xz* plane at the constant rate $\omega_0 = 10$ rad/s. At the instant shown, when crank *BC* is parallel to the *z* axis, determine the velocity of collar *A*.

SOLUTION

Geometry.

$$\mathbf{r}_{B/C} = (-8 \text{ in.})\mathbf{k},$$
$$\mathbf{r}_{A/B} = (-12 \text{ in.})\mathbf{i} + (21 \text{ in.})\mathbf{j} + (16 \text{ in.})\mathbf{k}$$

Velocity at B.

$$\mathbf{v}_B = \omega_0 \mathbf{j} \times \mathbf{r}_{B/C}$$
$$= 10\mathbf{j} \times (-8\mathbf{k})$$
$$= (-80 \text{ in./s})\mathbf{i}$$

Velocity of collar A.

$$\mathbf{v}_A = v_A \mathbf{j}$$
$$\mathbf{v}_A = \mathbf{v}_B + \mathbf{v}_{A/B}$$

where

$$\mathbf{v}_{A/B} = \boldsymbol{\omega}_{AB} \times \mathbf{r}_{A/B}$$

Noting that $\mathbf{v}_{A/B}$ is perpendicular to $\mathbf{r}_{A/B}$, we get $\mathbf{r}_{B/A} \cdot \mathbf{v}_{B/A} = 0$.

Forming $\mathbf{r}_{A/B} \cdot \mathbf{v}_A$, we get

$$\mathbf{r}_{A/B} \cdot \mathbf{v}_A = \mathbf{r}_{A/B} \cdot (\mathbf{v}_B + \mathbf{v}_{A/B})$$
$$= \mathbf{r}_{A/B} \cdot \mathbf{v}_B + \mathbf{r}_{A/B} \cdot \mathbf{v}_{A/B}$$

or

$$\mathbf{r}_{A/B} \cdot \mathbf{v}_A = \mathbf{r}_{A/B} \cdot \mathbf{v}_B \qquad (1)$$

From Eq. (1)

$$(-12\mathbf{i} + 21\mathbf{j} + 16\mathbf{k}) \cdot (v_A \mathbf{j}) = (-12\mathbf{i} + 21\mathbf{j} - 16\mathbf{k}) \cdot (-80\mathbf{i})$$
$$21 v_A = 960$$

or

$$v_A = 45.714 \text{ in./s} \qquad \mathbf{v}_A = (45.7 \text{ in./s})\mathbf{j} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. If you are a student using this Manual, you are using it without permission.*

Relative velocity.
$$\mathbf{v}_{A/B} = \mathbf{v}_A - \mathbf{v}_B$$
$$\mathbf{v}_{A/B} = (45.714 \text{ in./s})\mathbf{j} + (80 \text{ in./s})\mathbf{i}$$
$$(v_{A/B})^2 = (45.714)^2 + (80)^2$$
$$= 8489.8 \text{ (in./s}^2)$$

Acceleration of Point B.
$$\mathbf{a}_B = \omega_0 \mathbf{j} \times \mathbf{v}_B$$
$$= 10\mathbf{j} \times (-80)\mathbf{i}$$
$$= (800 \text{ in./s}^2)\mathbf{k}$$

Acceleration of collar A.
$$\mathbf{a}_A = a_A \mathbf{j}$$
$$\mathbf{a}_A = \mathbf{a}_B + \mathbf{a}_{A/B}$$

where
$$\mathbf{a}_{A/B} = \boldsymbol{\alpha}_{AB} \times \mathbf{r}_{A/B} + \boldsymbol{\omega}_{AB} \times \mathbf{v}_{A/B}$$

Noting that $\boldsymbol{\alpha}_{AB} \times \mathbf{r}_{A/B}$ is perpendicular to $\mathbf{r}_{A/B}$, we get $\mathbf{r}_{A/B} \cdot \boldsymbol{\alpha}_{AB} \times \mathbf{r}_{A/B} = 0.$

We note also that
$$\mathbf{r}_{A/B} \cdot \boldsymbol{\omega}_{AB} \times \mathbf{v}_{A/B} = \mathbf{v}_{A/B} \cdot \mathbf{r}_{A/B} \times \boldsymbol{\omega}_{A/B}$$
$$= -\mathbf{v}_{A/B} \cdot \mathbf{v}_{A/B}$$
$$= -(v_{A/B})^2$$

Then
$$\mathbf{r}_{A/B} \cdot \mathbf{a}_{A/B} = 0 - (v_{A/B})^2$$
$$= -(v_{A/B})^2$$

Forming $\mathbf{r}_{A/B} \cdot \mathbf{a}_A$, we get
$$\mathbf{r}_{A/B} \cdot \mathbf{a}_A = \mathbf{r}_{A/B} \cdot (\mathbf{a}_A + \mathbf{a}_{A/B})$$
$$= \mathbf{r}_{A/B} \cdot \mathbf{a}_B + \mathbf{r}_{A/B} - \mathbf{a}_{A/B}$$

or
$$\mathbf{r}_{A/B} \cdot \mathbf{a}_A = \mathbf{r}_{A/B} \cdot \mathbf{a}_B - (v_{A/B})^2 \qquad (2)$$

From Eq. (2) $(-12\mathbf{i} + 21\mathbf{j} + 16\mathbf{k}) \cdot (a_A \mathbf{j}) = (-12\mathbf{i} + 21\mathbf{j} + 16\mathbf{k}) \cdot (800\mathbf{k}) - 8489.8$

$$21a_A = 12{,}800 - 8489.8 \qquad \mathbf{a}_A = (205 \text{ in./s}^2)\mathbf{j} \blacktriangleleft$$

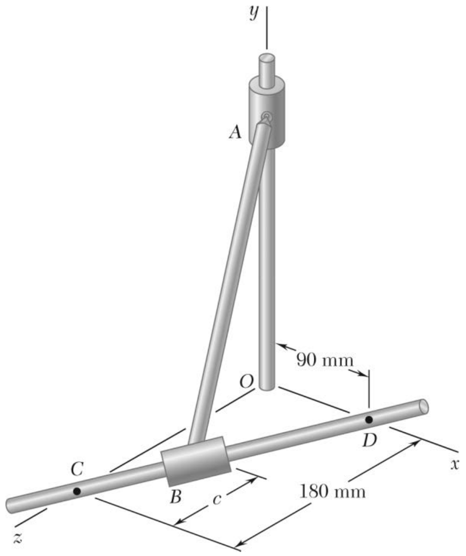
PROBLEM 15.218



In Problem 15.208, determine the acceleration of collar A.

PROBLEM 15.208 Rod AB of length 300 mm is connected by ball-and-socket joints to collars A and B, which slide along the two rods shown. Knowing that collar B moves toward Point D at a constant speed of 50 mm/s, determine the velocity of collar A when $c = 80$ mm.

SOLUTION

Geometry. $\mathbf{r}_A = y\mathbf{j}, \quad \mathbf{r}_D = (90\text{ mm})\mathbf{i} \quad \mathbf{r}_C = (180\text{ mm})\mathbf{k}$

$$\mathbf{r}_{D/C} = \mathbf{r}_D - \mathbf{r}_C = (90\text{ mm})\mathbf{i} - (180\text{ mm})\mathbf{k}$$

$$l_{CD} = \sqrt{(90)^2 + (180)^2} = 201.246\text{ mm}$$

$$\mathbf{r}_{B/C} = \frac{c(\mathbf{r}_{D/C})}{180} = \frac{80(90\mathbf{i} - 180\mathbf{k})}{180} = (40\text{ mm})\mathbf{i} - (80\text{ mm})\mathbf{k}$$

$$\mathbf{r}_B = \mathbf{r}_C + \mathbf{r}_{B/C} = 180\mathbf{k} + 40\mathbf{i} - 80\mathbf{k} = (40\text{ mm})\mathbf{i} + (100\text{ mm})\mathbf{k}$$

$$\mathbf{r}_{A/B} = \mathbf{r}_A - \mathbf{r}_B = -(40\text{ mm})\mathbf{i} + (y\text{ mm})\mathbf{j} - (100\text{ mm})\mathbf{k}$$

$$l_{AB}^2 = x_{A/B}^2 + y^2 + z_{A/B}^2: \quad 300^2 = (-40)^2 + y^2 + (-100)^2$$

$$y = 280\text{ mm},$$

$$\mathbf{r}_{A/B} = (-40\text{ mm})\mathbf{i} + (280\text{ mm})\mathbf{j} - (100\text{ mm})\mathbf{k}$$

Velocity of collar B. $\mathbf{v}_B = v_B \dfrac{\mathbf{r}_{D/C}}{l_{CD}}$

$$\mathbf{v}_B = \frac{(50)(90\mathbf{i} - 180\mathbf{k})}{201.246}$$

$$= (22.3607\text{ mm/s})\mathbf{i} - (44.7214\text{ mm/s})\mathbf{k}$$

Velocity of collar A. $\mathbf{v}_A = v_A\mathbf{j}$

$$\mathbf{v}_A = \mathbf{v}_B + \mathbf{v}_{A/B}$$

where $\mathbf{v}_{A/B} = \boldsymbol{\omega}_{AB} \times \mathbf{r}_{A/B}$

Noting that $\mathbf{v}_{A/B}$ is perpendicular to $\mathbf{r}_{A/B}$, we get $\mathbf{r}_{B/A} \cdot \mathbf{v}_{B/A} = 0$.

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

Forming $\mathbf{r}_{A/B}\cdot\mathbf{v}_A$, we get
$$\mathbf{r}_{A/B}\cdot\mathbf{v}_A = \mathbf{r}_{A/B}\cdot(\mathbf{v}_B+\mathbf{v}_{A/B}) = \mathbf{r}_{A/B}\cdot\mathbf{v}_B+\mathbf{r}_{A/B}\cdot\mathbf{v}_{A/B}$$

or
$$\mathbf{r}_{A/B}\cdot\mathbf{v}_A = \mathbf{r}_{A/B}\cdot\mathbf{v}_B \qquad (1)$$

From (1)
$$(-40\mathbf{i}+280\mathbf{j}-100\mathbf{k})\cdot(v_A\mathbf{j}) = (-40\mathbf{i}+280\mathbf{j}-100\mathbf{k})\cdot(22.3607\mathbf{i}-44.7214\mathbf{k})$$
$$280v_A = (-40)(22.3607)+(-100)(-44.7214)$$

or
$$v_A = 12.7775 \text{ mm/s} \qquad \mathbf{v}_A = (12.7775 \text{ mm/s})\,\mathbf{j}$$

<u>Relative velocity</u>.
$$\mathbf{v}_{A/B} = \mathbf{v}_A-\mathbf{v}_B = (12.7775 \text{ mm/s})\mathbf{i}-(22.3607 \text{ mm/s})\mathbf{j}+(44.7214 \text{ mm/s})\mathbf{k}$$
$$\mathbf{v}_{A/B}\cdot\mathbf{v}_{A/B} = (12.7775)^2+(22.3607)^2+(44.7214)^2 = 2663.3 \text{ mm}^2/\text{s}^2$$

Acceleration of collar B.
$$\mathbf{a}_B = 0$$

Acceleration of collar A.
$$\mathbf{a}_A = a_A\mathbf{j}$$
$$\mathbf{a}_A = \mathbf{a}_B+\mathbf{a}_{A/B}$$

where
$$\mathbf{a}_{A/B} = \boldsymbol{\alpha}_{AB}\times\mathbf{r}_{A/B}+\boldsymbol{\omega}_{AB}\times\mathbf{v}_{A/B}$$

Noting that $\boldsymbol{\alpha}_{AB}\times\mathbf{r}_{A/B}$ is perpendicular to $\mathbf{r}_{A/B}$, we get $\mathbf{r}_{A/B}\cdot\boldsymbol{\alpha}_{AB}\times\mathbf{r}_{A/B} = 0$

We note also that
$$\mathbf{r}_{A/B}\cdot\boldsymbol{\omega}_{AB}\times\mathbf{v}_{A/B} = \mathbf{v}_{A/B}\cdot\mathbf{r}_{A/B}\times\boldsymbol{\omega}_{A/B} = -\mathbf{v}_{A/B}\cdot\mathbf{v}_{A/B} = -(v_{A/B})^2$$

Then
$$\mathbf{r}_{A/B}\cdot\mathbf{a}_{A/B} = 0-(v_{A/B})^2 = -(v_{A/B})^2$$

Forming $\mathbf{r}_{A/B}\cdot\mathbf{a}_A$, we get
$$\mathbf{r}_{A/B}\cdot\mathbf{a}_A = \mathbf{r}_{A/B}\cdot(\mathbf{a}_A+\mathbf{a}_{A/B}) = \mathbf{r}_{A/B}\cdot\mathbf{a}_B+\mathbf{r}_{A/B}\cdot\mathbf{a}_{A/B}$$

or
$$\mathbf{r}_{A/B}\cdot\mathbf{a}_A = \mathbf{r}_{A/B}\cdot\mathbf{a}_B-(v_{A/B})^2 \qquad (2)$$

From Eq. (2)
$$(-40\mathbf{i}+280\mathbf{j}-100\mathbf{k})\cdot(a_A\mathbf{j}) = 0-2663.3$$
$$280a_A = -2663.3 \qquad a_A = -9.512 \text{ mm/s}^2$$

$$\mathbf{a}_A = -(9.51 \text{ mm/s}^2)\mathbf{j} \blacktriangleleft$$

PROBLEM 15.219

In Problem 15.209, determine the acceleration of collar *A*.

PROBLEM 15.209 Rod *AB* of length 300 mm is connected by ball-and-socket joints to collars *A* and *B*, which slide along the two rods shown. Knowing that collar *B* moves toward Point *D* at a constant speed of 50 mm/s, determine the velocity of collar *A* when $c = 120$ mm.

SOLUTION

Geometry. $\mathbf{r}_A = y\mathbf{j}, \quad \mathbf{r}_D = (90 \text{ mm})\mathbf{i} \quad \mathbf{r}_C = (180 \text{ mm})\mathbf{k}$

$$\mathbf{r}_{D/C} = \mathbf{r}_D - \mathbf{r}_C = (40 \text{ mm})\mathbf{i} - (180 \text{ mm})\mathbf{k}$$

$$l_{CD} = \sqrt{(90)^2 + (-180)^2} = 201.246$$

$$\mathbf{r}_{B/C} = \frac{c(\mathbf{r}_{D/C})}{180} = \frac{120(90\mathbf{i} - 180\mathbf{k})}{180} = (60 \text{ mm})\mathbf{i} - (120 \text{ mm})\mathbf{k}$$

$$\mathbf{r}_B = \mathbf{r}_C + \mathbf{r}_{B/C} = 180\mathbf{k} + 60\mathbf{i} - 120\mathbf{k} = (60 \text{ mm})\mathbf{i} + (60 \text{ mm})\mathbf{k}$$

$$\mathbf{r}_{A/B} = \mathbf{r}_A - \mathbf{r}_B = -60\mathbf{i} + y\,\mathbf{j} - 60\mathbf{k}$$

$$l_{AB}^2 = x_{A/B}^2 + y^2 + z_{A/B}^2: \quad 300^2 = 60^2 + y^2 + 60^2$$

$$y = 287.75 \text{ mm},$$

$$\mathbf{r}_{A/B} = (-60 \text{ mm})\mathbf{i} + (287.75 \text{ mm})\mathbf{j} - (60 \text{ mm})\mathbf{k}$$

Velocity of collar B.

$$\mathbf{v}_B = v_B \frac{\mathbf{r}_{D/C}}{l_{CD}}$$

$$\mathbf{v}_B = \frac{(50)(90\mathbf{i} - 180\mathbf{k})}{201.246}$$

$$= (22.3607 \text{ mm/s})\mathbf{i} - (44.7214 \text{ mm/s})\mathbf{k}$$

Velocity of collar A.

$$\mathbf{v}_A = v_A\mathbf{j}$$

$$\mathbf{v}_A = \mathbf{v}_B + \mathbf{v}_{A/B}$$

where

$$\mathbf{v}_{A/B} = \boldsymbol{\omega}_{AB} \times \mathbf{r}_{A/B}$$

Noting that $\mathbf{v}_{A/B}$ is perpendicular to $\mathbf{r}_{A/B}$, we get $\mathbf{r}_{B/A} \cdot \mathbf{v}_{B/A} = 0.$

If you are a student using this Manual, you are using it without permission.*

Forming $\mathbf{r}_{A/B} \cdot \mathbf{v}_A$, we get
$$\mathbf{r}_{A/B} \cdot \mathbf{v}_A = \mathbf{r}_{A/B} \cdot (\mathbf{v}_B + \mathbf{v}_{A/B}) = \mathbf{r}_{A/B} \cdot \mathbf{v}_B + \mathbf{r}_{A/B} \cdot \mathbf{v}_{A/B}$$

or
$$\mathbf{r}_{A/B} \cdot \mathbf{v}_A = \mathbf{r}_{A/B} \cdot \mathbf{v}_B \qquad (1)$$

From Eq. (1) $(-60\mathbf{i} + 287.75\mathbf{j} - 60\mathbf{k}) \cdot (v_A\mathbf{j}) = (-60\mathbf{i} + 287.75\mathbf{j} - 60\mathbf{k}) \cdot (1.11803\mathbf{i} - 2.23607\mathbf{j})$

$$287.75 v_A = (-60)(22.3607) + (-60)(-44.7214)$$

or
$$v_A = 4.6626 \text{ mm/s} \qquad \mathbf{v}_A = (4.6626 \text{ mm/s})\mathbf{j}$$

<u>Relative velocity</u>.
$$\mathbf{v}_{A/B} = \mathbf{v}_A - \mathbf{v}_B = -(22.3607 \text{ mm/s})\mathbf{i} + (4.6626 \text{ mm/s})\mathbf{j} + (44.7214 \text{ mm/s})\mathbf{k}$$
$$\mathbf{v}_{A/B} \cdot \mathbf{v}_{A/B} = (22.3607)^2 + (4.6626)^2 + (44.7214)^2 = 2521.7$$

Acceleration of collar B.
$$\mathbf{a}_B = 0$$

Acceleration of collar A.
$$\mathbf{a}_A = a_A\mathbf{j}$$
$$\mathbf{a}_A = \mathbf{a}_B + \mathbf{a}_{A/B}$$

where
$$\mathbf{a}_{A/B} = \boldsymbol{\alpha}_{AB} \times \mathbf{r}_{A/B} + \boldsymbol{\omega}_{AB} \times \mathbf{v}_{A/B}$$

Noting that $\boldsymbol{\alpha}_{AB} \times \mathbf{r}_{A/B}$ is perpendicular to $\mathbf{r}_{A/B}$, we get $\mathbf{r}_{A/B} \cdot \boldsymbol{\alpha}_{AB} \times \mathbf{r}_{A/B} = 0$.

We note also that
$$\mathbf{r}_{A/B} \cdot \boldsymbol{\omega}_{AB} \times \mathbf{v}_{A/B} = \mathbf{v}_{A/B} \cdot \mathbf{r}_{A/B} \times \boldsymbol{\omega}_{A/B} = -\mathbf{v}_{A/B} \cdot \mathbf{v}_{A/B} = -(v_{A/B})^2$$

Then
$$\mathbf{r}_{A/B} \cdot \mathbf{a}_{A/B} = 0 - (v_{A/B})^2 = -(v_{A/B})^2$$

Forming $\mathbf{r}_{A/B} \cdot \mathbf{a}_A$, we get
$$\mathbf{r}_{A/B} \cdot \mathbf{a}_A = \mathbf{r}_{A/B} \cdot (\mathbf{a}_A + \mathbf{a}_{A/B}) = \mathbf{r}_{A/B} \cdot \mathbf{a}_B + \mathbf{r}_{A/B} \cdot \mathbf{a}_{A/B}$$

or
$$\mathbf{r}_{A/B} \cdot \mathbf{a}_A = \mathbf{r}_{A/B} \cdot \mathbf{a}_B - (v_{A/B})^2 \qquad (2)$$

From Eq. (2), $(-60\mathbf{i} + 287.75\mathbf{j} - 60\mathbf{k}) \cdot (a_A\mathbf{j}) = 0 - 2521.7$

$$287.75 a_A = -2521.7 \qquad a_A = -8.764 \text{ mm/s}^2$$

$$\mathbf{a}_A = -(8.76 \text{ mm/s}^2)\mathbf{j} \blacktriangleleft$$

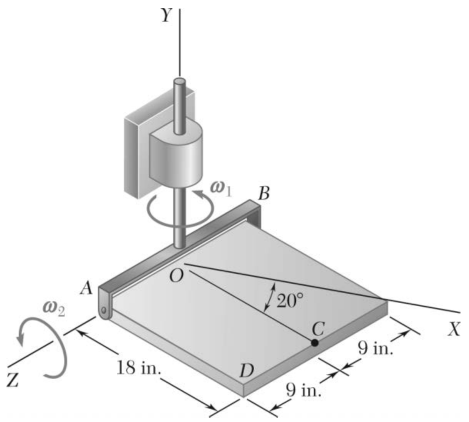
PROBLEM 15.220



A square plate of side 18 in. is hinged at *A* and *B* to a clevis. The plate rotates at the constant rate $\omega_2 = 4$ rad/s with respect to the clevis, which itself rotates at the constant rate $\omega_1 = 3$ rad/s about the *Y* axis. For the position shown, determine (*a*) the velocity of Point *C*, (*b*) the acceleration of Point *C*.

SOLUTION

Geometry. $\mathbf{r}_C = (18 \text{ in.})(\cos 20°\mathbf{i} - \sin 20°\mathbf{j})$

Let frame *Oxyz* rotate about the *y* axis with angular velocity $\boldsymbol{\Omega} = \omega_1\mathbf{j}$ and angular acceleration $\dot{\boldsymbol{\Omega}} = 0.$ Then the motion relative to the frame consists of rotation with angular velocity $\boldsymbol{\omega}_2 = \omega_2\mathbf{k}$ and angular acceleration $\boldsymbol{\alpha}_2 = 0$ about the *z* axis.

(*a*)

$$\begin{aligned}
\mathbf{v}_{C'} &= \boldsymbol{\Omega} \times \mathbf{r}_C \\
&= 3\mathbf{j} \times (18\cos 20°\mathbf{i} - 18\sin 20°\mathbf{j}) \\
&= -54\cos 20°\mathbf{k} \\
\mathbf{v}_{C/F} &= \boldsymbol{\omega}_2 \times \mathbf{r}_C \\
&= 4\mathbf{k} \times (18\cos 20°\mathbf{i} - 18\sin 20°\mathbf{j}) \\
&= 72\sin 20°\mathbf{i} + 72\cos 20°\mathbf{j} \\
\mathbf{v}_C &= \mathbf{v}_{C'} + \mathbf{v}_{C/F} \\
&= 72\sin 20°\mathbf{i} + 72\cos 20°\mathbf{j} - 54\cos 20°\mathbf{k}
\end{aligned}$$

$$\mathbf{v}_C = (24.6 \text{ in./s})\mathbf{i} + (67.7 \text{ in./s})\mathbf{j} - (50.7 \text{ in./s})\mathbf{k} \blacktriangleleft$$

(*b*)

$$\begin{aligned}
\mathbf{a}_{C'} &= \boldsymbol{\Omega} \times \mathbf{v}_{C'} \\
&= 3\mathbf{j} \times (-54\cos 20°\mathbf{k}) \\
&= -162\cos 20°\mathbf{i} \\
\mathbf{a}_{C/F} &= \boldsymbol{\omega}_2 \times \mathbf{v}_{C/F} \\
&= 4\mathbf{k} \times (72\sin 20°\mathbf{i} + 72\cos 20°\mathbf{j}) \\
&= -288\cos 20°\mathbf{i} + 288\sin 20°\mathbf{j} \\
2\boldsymbol{\Omega} \times \mathbf{v}_{C/F} &= (2)(3\mathbf{j}) \times (72\sin 20°\mathbf{i} + 72\cos 20°\mathbf{j}) \\
&= -432\sin 20°\mathbf{k} \\
\mathbf{a}_C &= \mathbf{a}_{C'} + \mathbf{a}_{C/F} + 2\boldsymbol{\Omega} \times \mathbf{v}_{C/F} \\
&= -(162 + 288)\cos 20°\mathbf{i} + 288\sin 20°\mathbf{j} - 432\sin 20°\mathbf{k}
\end{aligned}$$

$$\mathbf{a}_C = -(423 \text{ in./s}^2)\mathbf{i} + (98.5 \text{ in./s}^2)\mathbf{j} - (147.8 \text{ in./s}^2)\mathbf{k} \blacktriangleleft$$

PROBLEM 15.221

A square plate of side 18 in. is hinged at *A* and *B* to a clevis. The plate rotates at the constant rate $\omega_2 = 4$ rad/s with respect to the clevis, which itself rotates at the constant rate $\omega_1 = 3$ rad/s about the *Y* axis. For the position shown, determine (*a*) the velocity of corner *D*, (*b*) the acceleration of corner *D*.

SOLUTION

Geometry. $\mathbf{r}_D = (18 \text{ in.})(\cos 20°\mathbf{i} - \sin 20°\mathbf{j}) + (9 \text{ in.})\mathbf{k}$

Let frame *Oxyz* rotate about the *y* axis with angular velocity $\mathbf{\Omega} = \omega_1\mathbf{j}$ and angular acceleration $\dot{\mathbf{\Omega}} = 0$. Then the motion relative to the frame consists of rotation with angular velocity $\boldsymbol{\omega}_2 = \omega_2\mathbf{k}$ and angular acceleration $\boldsymbol{\alpha}_2 = 0$ about the *z* axis.

(*a*)

$$\begin{aligned}
\mathbf{v}_{D'} &= \mathbf{\Omega} \times \mathbf{r}_D \\
&= 3\mathbf{j} \times (18\cos 20°\mathbf{i} - 18\sin 20°\mathbf{j} + 9\mathbf{k}) \\
&= 27\mathbf{i} - 54\cos 20°\mathbf{k} \\
\mathbf{v}_{D/F} &= \boldsymbol{\omega}_2 \times \mathbf{r}_D \\
&= 4\mathbf{k} \times (18\cos 20°\mathbf{i} - 18\sin 20°\mathbf{j} + 9\mathbf{k}) \\
&= 72\sin 20°\mathbf{i} + 72\cos 20°\mathbf{j} \\
\mathbf{v}_D &= \mathbf{v}_{D'} + \mathbf{v}_{D/F} \\
&= (27 + 72\sin 20°)\mathbf{i} + 72\cos 20°\mathbf{j} - 54\cos 20°\mathbf{k}
\end{aligned}$$

$$\mathbf{v}_D = (51.6 \text{ in./s})\mathbf{i} + (67.7 \text{ in./s})\mathbf{j} - (50.7 \text{ in./s})\mathbf{k} \blacktriangleleft$$

(*b*)

$$\begin{aligned}
\mathbf{a}_{D'} &= \mathbf{\Omega} \times \mathbf{v}_{D'} \\
&= 3\mathbf{j} \times (27\mathbf{i} - 54\cos 20°\mathbf{k}) \\
&= -162\cos 20°\mathbf{i} - 81\mathbf{k} \\
\mathbf{a}_{D/F} &= \boldsymbol{\omega}_2 \times \mathbf{v}_{D/F} \\
&= 4\mathbf{k} \times (72\sin 20°\mathbf{i} + 72\cos 20°\mathbf{j}) \\
&= -288\cos 20°\mathbf{i} + 288\sin 20°\mathbf{j} \\
2\mathbf{\Omega} \times \mathbf{v}_{D/F} &= (2)(3\mathbf{j}) \times (72\sin 20°\mathbf{i} + 72\cos 20°\mathbf{j}) \\
&= -432\sin 20°\mathbf{k} \\
\mathbf{a}_D &= \mathbf{a}_{D'} + \mathbf{a}_{D/F} + 2\mathbf{\Omega} \times \mathbf{v}_{C/F} \\
&= -(162 + 288)\cos 20°\mathbf{i} + 288\sin 20°\mathbf{j} - (81 + 432\sin 20°)\mathbf{k}
\end{aligned}$$

$$\mathbf{a}_D = -(423 \text{ in./s}^2)\mathbf{i} + (98.5 \text{ in./s}^2)\mathbf{j} - (229 \text{ in./s}^2)\mathbf{k} \blacktriangleleft$$

PROBLEM 15.222

The rectangular plate shown rotates at the constant rate $\omega_2 = 12$ rad/s with respect to arm AE, which itself rotates at the constant rate $w_1 = 9$ rad/s about the Z axis. For the position shown, determine the velocity and acceleration of the point of the plate indicated.

Corner B.

SOLUTION

Geometry. With the origin at A, $\mathbf{r}_B = (0.135 \text{ m})\mathbf{j}$

Let frame $AXYZ$ rotate about the Y axis with constant angular velocity $\mathbf{\Omega} = \omega_1 \mathbf{k} = (9 \text{ rad/s})\mathbf{k}$. Then the motion relative to the frame consists of rotation about the X axis with constant angular velocity $\boldsymbol{\omega}_2 = \omega_2 \mathbf{i} = (12 \text{ rad/s})\mathbf{i}$.

Motion of coinciding Point B′.

$$\mathbf{v}_{B'} = \mathbf{\Omega} \times \mathbf{r}_B$$
$$= 9\mathbf{k} \times 0.135\mathbf{j}$$
$$= -(1.215 \text{ m/s})\mathbf{i}$$
$$\mathbf{a}_{B'} = \boldsymbol{\alpha} \times \mathbf{r}_B + \mathbf{\Omega} \times \mathbf{v}_{B'}$$
$$= 0 + 9\mathbf{k} \times (-1.215\mathbf{i})$$
$$= -(10.935 \text{ m/s}^2)\mathbf{j}$$

Motion relative to the frame.

$$\mathbf{v}_{B/F} = \boldsymbol{\omega}_2 \times \mathbf{r}_B = 12\mathbf{i} \times 0.135\mathbf{j}$$
$$= (1.62 \text{ m/s})\mathbf{k}$$
$$\mathbf{a}_{B/F} = \boldsymbol{\alpha}_2 \times \mathbf{r}_B + \boldsymbol{\omega}_2 \times \mathbf{v}_{B/F}$$
$$= 0 + 12\mathbf{i} \times 1.62\mathbf{k}$$
$$= -(19.44 \text{ m/s}^2)\mathbf{j}$$

Velocity of Point B. $\mathbf{v}_B = \mathbf{v}_{B'} + \mathbf{v}_{B/F}$

$\mathbf{v}_B = -(1.215 \text{ m/s})\mathbf{i} + (1.620 \text{ m/s})\mathbf{k}$ ◀

Coriolis acceleration. $2\mathbf{\Omega} \times \mathbf{v}_{B/F}$

$$2\mathbf{\Omega} \times \mathbf{v}_{B/F} = (2)(9\mathbf{k}) \times 1.62\mathbf{k} = 0$$

Acceleration of Point B.

$$\mathbf{a}_B = \mathbf{a}_{B'} + \mathbf{a}_{B/F} + 2\mathbf{\Omega} \times \mathbf{v}_{B/F}$$
$$\mathbf{a}_B = -(30.375 \text{ in./s}^2)\mathbf{j}$$

$\mathbf{a}_B = -(30.4 \text{ m/s}^2)\mathbf{j}$ ◀

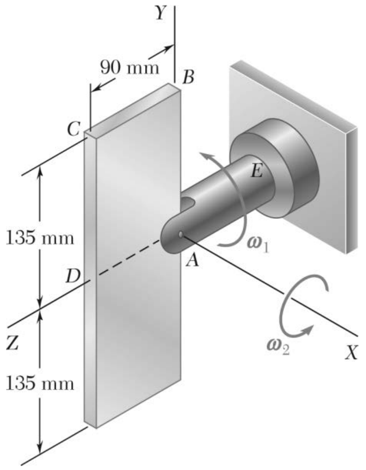
PROBLEM 15.223



The rectangular plate shown rotates at the constant rate $\omega_2 = 12$ rad/s with respect to arm AE, which itself rotates at the constant rate $\omega_1 = 9$ rad/s about the Z axis. For the position shown, determine the velocity and acceleration of the point of the plate indicated.

Corner C.

SOLUTION

Geometry. With the origin at A, $\quad \mathbf{r}_C = (0.135 \text{ m})\mathbf{j} + (0.09 \text{ m})\mathbf{k}$

Let frame $AXYZ$ rotate about the Y axis with constant angular velocity $\mathbf{\Omega} = \omega_1\mathbf{k} = (9 \text{ rad/s})\mathbf{k}$. Then the motion relative to the frame consists of rotation about the X axis with constant angular velocity $\boldsymbol{\omega}_2 = \omega_2\mathbf{i} = (12 \text{ rad/s})\mathbf{i}$.

Motion of coinciding Point C' in the frame.

$$\mathbf{v}_{C'} = \mathbf{\Omega} \times \mathbf{r}_C$$
$$= 9\mathbf{k} \times (0.135\mathbf{j} + 0.09\mathbf{k})$$
$$= -(1.215 \text{ m/s})\mathbf{i}$$
$$\mathbf{a}_{C'} = \boldsymbol{\alpha} \times \mathbf{r}_C + \mathbf{\Omega} \times \mathbf{v}_{C'}$$
$$= 0 + 9\mathbf{k} \times (1.215\mathbf{i})$$
$$= -(10.935 \text{ m/s}^2)\mathbf{j}$$

Motion relative to the frame.

$$\mathbf{v}_{C/F} = \boldsymbol{\omega}_2 \times \mathbf{r}_C$$
$$= 12\mathbf{i} \times (0.135\mathbf{j} + 0.09\mathbf{k})$$
$$= -(1.08 \text{ m/s})\mathbf{j} + (1.62 \text{ m/s})\mathbf{k}$$
$$\mathbf{a}_{C/F} = \boldsymbol{\alpha}_2 \times \mathbf{r}_C + \boldsymbol{\omega}_2 \times \mathbf{v}_{C/F}$$
$$= 0 + 12\mathbf{i} \times (-1.08\mathbf{j} + 1.62\mathbf{k})$$
$$= -(19.44 \text{ m/s}^2)\mathbf{j} - (12.96 \text{ m/s}^2)\mathbf{k}$$

Velocity of Point C. $\quad \mathbf{v}_C = \mathbf{v}_{C'} + \mathbf{v}_{C/F}$

$$\mathbf{v}_C = -(1.215 \text{ m/s})\mathbf{i} - (1.080 \text{ m/s})\mathbf{j} + (1.620 \text{ m/s})\mathbf{k} \quad \blacktriangleleft$$

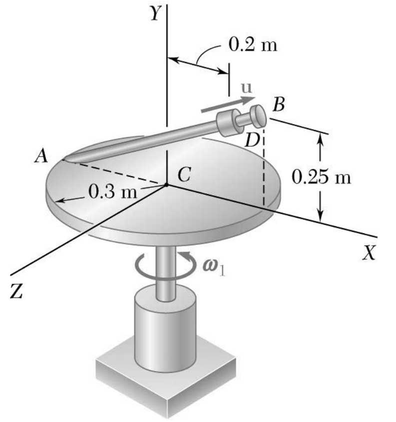
PROBLEM 15.224



Rod AB is welded to the 0.3-m-radius plate, which rotates at the constant rate $\omega_1 = 6$ rad/s. Knowing that collar D moves toward end B of the rod at a constant speed $u = 1.3$ m, determine, for the position shown, (*a*) the velocity of D, (*b*) the acceleration of D.

SOLUTION

Geometry.

$$\mathbf{r}_{B/A} = (0.6 \text{ m})\mathbf{i} + (0.25 \text{ m})\mathbf{j} \qquad \mathbf{r}_{C/A} = (0.3 \text{ m})\mathbf{i}$$

$$\mathbf{r}_{D/A} = \frac{0.5}{0.6}\mathbf{r}_{B/A}$$

$$\mathbf{r}_{D/C} = \mathbf{r}_{D/A} - \mathbf{r}_{C/A}$$

$$= (0.2 \text{ m})\mathbf{i} + (0.20833 \text{ m})\mathbf{j}$$

$$l_{AB} = \sqrt{0.6^2 + 0.25^2}$$

$$= 0.65 \text{ m}$$

Unit vector along AB:

$$\boldsymbol{\lambda}_{AB} = \frac{\mathbf{r}_{B/A}}{l_{AB}}$$

$$= \frac{12}{13}\mathbf{i} + \frac{5}{12}\mathbf{j}$$

Let $Oxyz$ be a frame of reference currently coinciding with $OXYZ$, but rotating with angular velocity

$$\boldsymbol{\Omega} = \omega_1\mathbf{j} = (6 \text{ rad/s})\mathbf{j}$$

(*a*) *Velocity of D.*

$$\mathbf{v}_D = \mathbf{v}_{D'} + \mathbf{v}_{D/AB}$$

$$\mathbf{v}_{D'} = \boldsymbol{\Omega} \times \mathbf{r}_{D/C}$$

$$= 6\mathbf{j} \times (0.2\mathbf{i} + 0.20833\mathbf{j})$$

$$= -(1.2 \text{ m/s})\mathbf{k}$$

$$\mathbf{v}_{D/AB} = u\boldsymbol{\lambda}_{AB}$$

$$= 1.3\left(\frac{12}{13}\mathbf{i} + \frac{5}{13}\mathbf{j}\right)$$

$$= (1.2 \text{ m/s})\mathbf{i} + (0.5 \text{ m/s})\mathbf{j}$$

$$\mathbf{v}_D = (1.2 \text{ m/s})\mathbf{i} + (0.5 \text{ m/s})\mathbf{j} - (1.2 \text{ m/s})\mathbf{k} \quad ◀$$

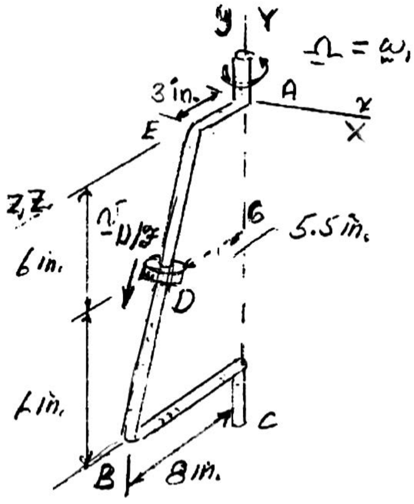
PROBLEM 15.225

The bent rod *ABC* rotates at the constant rate $\omega_1 = 4$ rad/s. Knowing that collar *D* moves downward along the rod at a constant relative speed $u = 65$ in./s, determine, for the position shown, (*a*) the velocity of *D*, (*b*) the acceleration of *D*.

SOLUTION



Units: inches, in./s, in./s^2

Geometry.

$$\mathbf{r}_E = 3\mathbf{k}$$

$$\mathbf{r}_B = -12\mathbf{j} + 8\mathbf{k}$$

$$\mathbf{r}_{B/E} = -12\mathbf{j} + 5\mathbf{k}$$

$$\mathbf{r}_D = \frac{1}{2}(\mathbf{r}_E + \mathbf{r}_B) = -6\mathbf{j} + 5.5\mathbf{k}$$

$$l_{EB} = \sqrt{12^2 + 5^2} = 13$$

Unit vector along *EB*: $\boldsymbol{\lambda} = \dfrac{\mathbf{r}_{B/E}}{l_{EB}} = -\dfrac{12}{13}\mathbf{j} + \dfrac{5}{13}\mathbf{k}$

Use a rotating frame of reference that rotates with angular velocity

$$\boldsymbol{\Omega} = \boldsymbol{\omega}_1 = (4 \text{ rad/s})\mathbf{j}$$

Motion of Point *D′* in the frame currently at *D*.

$$\mathbf{v}_{D'} = \boldsymbol{\omega}_1 \times \mathbf{r}_D = 4\mathbf{j} \times (-6\mathbf{j} + 5.5\mathbf{k})$$
$$= (22 \text{ in./s})\mathbf{i}$$

$$\mathbf{a}_{D'} = \dot{\boldsymbol{\omega}}_1\mathbf{j} \times \mathbf{r}_D + \boldsymbol{\omega}_1 \times \mathbf{v}_{D'}$$
$$= 0 + (4\mathbf{j}) \times (22\mathbf{i})$$
$$= -(88 \text{ in./s}^2)\mathbf{k}$$

PROBLEM 15.226

The bent pipe shown rotates at the constant rate $\omega_1 = 10$ rad/s. Knowing that a ball bearing D moves in portion BC of the pipe toward end C at a constant relative speed $u = 2$ ft/s, determine at the instant shown (a) the velocity of D, (b) the acceleration of D.

SOLUTION

With the origin at Point A, $\mathbf{r}_D = (8\text{ in.})\mathbf{i} + (12\text{ in.})\mathbf{j} - (6\text{ in.})\mathbf{k}$

$$\mathbf{r}_{C/B} = (8\text{ in.})\mathbf{i} - (6\text{ in.})\mathbf{k},$$

$$l_{BC} = \sqrt{8^2 + 6^2} = 10\text{ in.}$$

Let the frame $Axyz$ rotate with angular velocity $\boldsymbol{\Omega} = \omega_1\mathbf{i} = (10\text{ rad/s})\mathbf{i}$

(a) *Velocity of D.*

$$\begin{aligned}\mathbf{v}_{D'} &= \boldsymbol{\Omega} \times \mathbf{r}_D \\ &= 10\mathbf{i} \times (8\mathbf{i} + 12\mathbf{j} - 6\mathbf{k}) \\ &= (60\text{ in./s})\mathbf{j} + (120\text{ in./s})\mathbf{k}\end{aligned}$$

$$u = 2\text{ ft/s} = 24\text{ in./s},$$

$$\begin{aligned}\mathbf{v}_{D/F} &= \frac{24}{10}(8\mathbf{i} - 6\mathbf{k}) \\ &= (19.2\text{ in./s})\mathbf{i} - (14.4\text{ in./s})\mathbf{k}\end{aligned}$$

$$\begin{aligned}\mathbf{v}_D &= \mathbf{v}_{D'} + \mathbf{v}_{D/F} \\ &= (19.2\text{ in./s})\mathbf{i} + (60\text{ in./s})\mathbf{j} + (105.6\text{ in./s})\mathbf{k}\end{aligned}$$

$$\mathbf{v}_D = (1.600\text{ ft/s})\mathbf{i} + (5.00\text{ ft/s})\mathbf{j} + (8.80\text{ ft/s})\mathbf{k} \blacktriangleleft$$

(b) *Acceleration of D.*

$$\mathbf{a}_{D'} = \boldsymbol{\Omega} \times \mathbf{v}_{D'} = 10\mathbf{i} \times (60\mathbf{j} + 120\mathbf{k}) = -(1200\text{ in./s}^2)\mathbf{j} + (600\text{ in./s}^2)\mathbf{k}$$

$$\mathbf{a}_{D/F} = 0$$

$$2\boldsymbol{\Omega} \times \mathbf{v}_{D/F} = (2)(10\mathbf{i}) \times (19.2\mathbf{i} - 14.4\mathbf{k}) = (288\text{ in./s}^2)\mathbf{j}$$

$$\mathbf{a}_D = \mathbf{a}_{D'} + \mathbf{a}_{D/F} + 2\boldsymbol{\Omega} \times \mathbf{v}_{D/F} = -(912\text{ in./s}^2)\mathbf{j} + (600\text{ in./s}^2)\mathbf{k}$$

$$\mathbf{a}_D = -(76.0\text{ ft/s}^2)\mathbf{j} + (50.0\text{ ft/s}^2)\mathbf{k} \blacktriangleleft$$

PROBLEM 15.227

The circular plate shown rotates about its vertical diameter at the constant rate $\omega_1 = 10$ rad/s. Knowing that in the position shown the disk lies in the *XY* plane and Point *D* of strap *CD* moves upward at a constant relative speed $u = 1.5$ m/s, determine (*a*) the velocity of *D*, (*b*) the acceleration of *D*.

SOLUTION

Geometry.

$$\mathbf{r}_{D/C} = (0.2\text{ m})(\cos 30°\mathbf{i} - \sin 30°\mathbf{j})$$
$$= (0.1\sqrt{3}\text{ m})\mathbf{i} - (0.1\text{ m})\mathbf{j}$$

Let frame *Cxyz*, which at the instant shown coincides with *CXYZ*, rotate with angular velocity

$$\mathbf{\Omega} = \omega_1\mathbf{j} = (10\text{ rad/s})\mathbf{j}.$$

Motion of coinciding Point D' in the frame.

$$\mathbf{v}_{D'} = \mathbf{\Omega} \times \mathbf{r}_{D/C}$$
$$= 10\mathbf{j} \times (0.1\sqrt{3}\mathbf{i} + 0.1\mathbf{j})$$
$$= -(\sqrt{3}\text{ m/s})\mathbf{k}$$
$$\mathbf{a}_{D'} = -\Omega^2(r\cos 30°)\mathbf{i}$$
$$= -10^2(0.1\sqrt{3})\mathbf{i}$$
$$= -(10\sqrt{3}\text{ m/s}^2)\mathbf{i}$$

Motion of Point D relative to the frame. $u = 1.5$ m/s

$$\mathbf{v}_{D/F} = u(\sin 30°\mathbf{i} + \cos 30°\mathbf{j})$$
$$= (0.75\text{ m/s})\mathbf{i} + (0.75\sqrt{3}\text{ m/s})\mathbf{j}$$
$$\mathbf{a}_{D/F} = \frac{u^2}{\rho} \cdot (-\cos 30°\mathbf{i} + \sin 30°\mathbf{j})$$
$$= \frac{1.5^2}{0.2}(-\cos 30°\mathbf{i} + \sin 30°\mathbf{j})$$
$$= -(5.625\sqrt{3}\text{ m/s}^2)\mathbf{i} + (5.625\text{ m/s}^2)\mathbf{j}$$

PROBLEM 15.228

Manufactured items are spray-painted as they pass through the automated work station shown. Knowing that the bent pipe ACE rotates at the constant rate $\omega_1 = 0.4$ rad/s and that at Point D the paint moves through the pipe at a constant relative speed $u = 150$ mm/s, determine, for the position shown, (*a*) the velocity of the paint at D, (*b*) the acceleration of the paint at D.

SOLUTION

Use a frame of reference CE rotating about the x-axis with angular velocity

$$\boldsymbol{\Omega} = \boldsymbol{\omega}_1 = (0.4 \text{ rad/s})\mathbf{i}$$

Geometry:

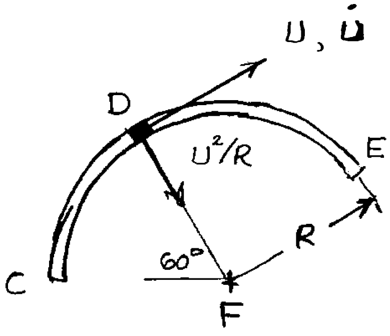
$$\mathbf{r}_{D/F} = (250 \text{ mm})(-\cos 60°\mathbf{i} + \sin 60°\mathbf{j})$$
$$= -(125 \text{ mm})\mathbf{i} + (216.51 \text{ mm})\mathbf{j}$$

Motion of Point D' fixed in the frame CE but coinciding with Point D at the instant considered.

$$\mathbf{v}_{D'} = \Omega \times \mathbf{r}_{D/F} = (0.4\mathbf{i}) \times (-125\mathbf{i} + 216.51\mathbf{j}) = (86.603 \text{ mm/s})\mathbf{k}$$

$$\mathbf{a}_{D'} = \dot{\Omega}\mathbf{i} \times \mathbf{r}_{D/F} + \boldsymbol{\Omega} \times \mathbf{v}_{D'}$$
$$= 0 + (0.4\mathbf{i}) \times (86.603\mathbf{k}) = -(34.641 \text{ mm/s}^2)\mathbf{j}$$

Motion of D relative to the frame CE.



$$\mathbf{v}_{D/CE} = u(\cos 30°\mathbf{i} + \sin 30°\mathbf{j}) = (150 \text{ mm/s})(\cos 30°\mathbf{i} + \sin 30°\mathbf{j})$$
$$= (129.90 \text{ mm/s})\mathbf{i} + (75 \text{ mm/s})\mathbf{j}$$

$$\mathbf{a}_{D/CE} = \dot{u}(\cos 30°\mathbf{i} + \sin 30°\mathbf{j}) + \frac{u^2}{R}(\sin 30°\mathbf{i} - \cos 30°\mathbf{j})$$
$$= 0 + \frac{(150)^2}{250}(\sin 30°\mathbf{i} - \cos 30°\mathbf{j})$$
$$= (45 \text{ mm/s}^2)\mathbf{i} - (77.94 \text{ mm/s}^2)\mathbf{j}$$

(*a*) *Velocity of D.* $\mathbf{v}_D = \mathbf{v}_{D'} + \mathbf{v}_{D/CE}$

$$\mathbf{v}_D = (129.9 \text{ mm/s})\mathbf{i} + (75.0 \text{ mm/s})\mathbf{j} + (86.6 \text{ mm/s})\mathbf{k} \blacktriangleleft$$

Coriolis acceleration $2\boldsymbol{\Omega} \times \mathbf{v}_{D/CE}$

$$2\boldsymbol{\Omega} \times \mathbf{v}_{D/CE} = (2)(0.4\mathbf{i}) \times (129.90\mathbf{i} + 75\mathbf{j}) = (60 \text{ mm/s}^2)\mathbf{k}$$

(*b*) *Acceleration of D.* $\mathbf{a}_D = \mathbf{a}_{D'} + \mathbf{a}_{D/CE} + 2\boldsymbol{\Omega} \times \mathbf{v}_{D/CE}$

$$\mathbf{a}_D = (45.0 \text{ mm/s}^2)\mathbf{i} - (112.6 \text{ mm/s}^2)\mathbf{j} + (60.0 \text{ mm/s}^2)\mathbf{k} \blacktriangleleft$$

PROBLEM 15.229

Solve Problem 15.227, assuming that at the instant shown the angular velocity $\boldsymbol{\omega}_1$ of the plate is 10 rad/s and is decreasing at the rate of 25 rad/s^2, while the relative speed u of Point D of strap CD is 1.5 m/s and is decreasing at the rate of 3 m/s^2.

PROBLEM 15.227 The circular plate shown rotates about its vertical diameter at the constant rate $\omega_1 = 10$ rad/s. Knowing that in the position shown the disk lies in the XY plane and Point D of strap CD moves upward at a constant relative speed $u = 1.5$ m/s, determine (a) the velocity of D, (b) the acceleration of D.

SOLUTION

Geometry.

$$\mathbf{r}_{D/C} = (0.2 \text{ m})(\cos 30°\mathbf{i} - \sin 30°\mathbf{j})$$
$$= (0.1\sqrt{3} \text{ m})\mathbf{i} - (0.1 \text{ m})\mathbf{j}$$

Let frame $Cxyz$, which at the instant shown coincides with $CXYZ$, rotate with angular velocity and angular acceleration

$$\boldsymbol{\Omega} = \omega_1\mathbf{j} = (10 \text{ rad/s})\mathbf{j}.$$

$$\dot{\boldsymbol{\Omega}} = -(25 \text{ rad/s}^2)\mathbf{j}.$$

Motion of coinciding Point D' in the frame

$$\mathbf{v}_{D'} = \boldsymbol{\Omega} \times \mathbf{r}_{D/C}$$
$$= 10\mathbf{j} \times (0.1\sqrt{3}\mathbf{i} + 0.1\mathbf{j}) = -(\sqrt{3} \text{ m/s})\mathbf{k}$$
$$\mathbf{a}_{D'} = -\Omega^2(r\cos 30°)\mathbf{i} + \dot{\boldsymbol{\Omega}} \times \mathbf{r}_{D/C}$$
$$= -10^2(0.1\sqrt{3})\mathbf{i} - 25\mathbf{j} \times (0.1\sqrt{3}\mathbf{i} + 0.1\mathbf{j})$$
$$= -(10\sqrt{3} \text{ m/s}^2)\mathbf{i} + (2.5\sqrt{3} \text{ m/s}^2)\mathbf{k}$$

Motion of Point D relative to the frame. $\quad u = 1.5$ m/s $\qquad \dot{u} = -3$ m/s^2

$$\mathbf{v}_{D/F} = u(\sin 30°\mathbf{i} + \cos 30°\mathbf{j})$$
$$= (0.75 \text{ m/s})\mathbf{i} + (0.75\sqrt{3} \text{ m/s})\mathbf{j}$$

PROBLEM 15.230

Solve Problem 15.226, assuming that at the instant shown the angular velocity ω_1 of the pipe is 10 rad/s and is decreasing at the rate of 15 rad/s^2, while the relative speed u of the ball bearing is 2 ft/s and is increasing at the rate of 10 ft/s^2.

PROBLEM 15.226 The bent pipe shown rotates at the constant rate $\omega_1 = 10$ rad/s. Knowing that a ball bearing D moves in portion BC of the pipe toward end C at a constant relative speed $u = 2$ ft/s, determine at the instant shown (a) the velocity of D, (b) the acceleration of D.

SOLUTION

With the origin at Point A, $\mathbf{r}_D = (8\text{ in.})\mathbf{i} + (12\text{ in.})\mathbf{j} - (6\text{ in.})\mathbf{k}$

$$\mathbf{r}_{C/B} = (8\text{ in.})\mathbf{i} - (6\text{ in.})\mathbf{k},$$

$$l_{BC} = \sqrt{8^2 + 6^2} = 10\text{ in.}$$

Let the frame $Axyz$ rotate with angular velocity $\mathbf{\Omega} = \omega_1\mathbf{i} = (10\text{ rad/s})\mathbf{i}$ and angular acceleration

$\dot{\mathbf{\Omega}} = \dot{\omega}_1\mathbf{i} = -(15\text{ rad/s}^2)\mathbf{i}.$

(a) *Velocity of D.*

$$\begin{aligned}\mathbf{v}_{D'} &= \mathbf{\Omega} \times \mathbf{r}_D \\ &= 10\mathbf{i} \times (8\mathbf{i} + 12\mathbf{j} - 6\mathbf{k}) \\ &= (60\text{ in./s})\mathbf{j} + (120\text{ in./s})\mathbf{k}\end{aligned}$$

$$u = 2\text{ ft/s} = 24\text{ in./s},$$

$$\begin{aligned}\mathbf{u} &= \frac{24}{10}(8\mathbf{i} - 6\mathbf{k}) \\ &= (19.2\text{ in./s})\mathbf{i} - (14.4\text{ in./s})\mathbf{k}\end{aligned}$$

$$\begin{aligned}\mathbf{v}_D &= \mathbf{v}_{D'} + \mathbf{u} \\ &= (19.2\text{ in./s})\mathbf{i} + (60\text{ in./s})\mathbf{j} + (105.6\text{ in./s})\mathbf{k}\end{aligned}$$

$$\mathbf{v}_D = (1.600\text{ ft/s})\mathbf{i} + (5.00\text{ ft/s})\mathbf{j} + (8.80\text{ ft/s})\mathbf{k} \blacktriangleleft$$

(b) *Acceleration of D.*

$$\begin{aligned}\mathbf{a}_{D'} &= \dot{\mathbf{\Omega}} \times \mathbf{r}_D + \mathbf{\Omega} \times \mathbf{v}_{D'} \\ &= -15\mathbf{i} \times (8\mathbf{i} + 12\mathbf{j} - 6\mathbf{k}) + 10\mathbf{i} \times (60\mathbf{j} + 120\mathbf{k}) \\ &= -90\mathbf{j} - 180\mathbf{k} - 1200\mathbf{j} + 600\mathbf{k} \\ &= -(1290\text{ in./s}^2)\mathbf{j} + (420\text{ in./s}^2)\mathbf{k}\end{aligned}$$

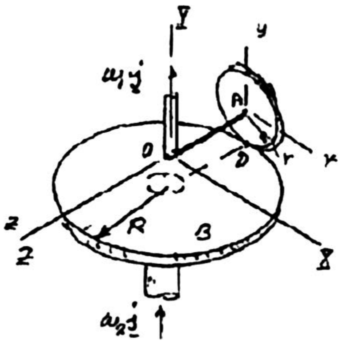
PROBLEM 15.231

Using the method of Section 15.14, solve Problem 15.192.

PROBLEM 15.192 In the system shown, disk *A* is free to rotate about the horizontal rod *OA*. Assuming that shaft *OC* and disk *B* rotate with constant angular velocities ω_1 and ω_2, respectively, both counterclockwise, determine (*a*) the angular velocity of *A*, (*b*) the angular acceleration of disk *A*.

SOLUTION



Moving frame *Axyz* rotates with angular velocity

$$\mathbf{\Omega} = \omega_1 \mathbf{j}$$

$$\boldsymbol{\omega}_{\text{disk}/F} = \omega_x \mathbf{i} + \omega_z \mathbf{k}$$

$$\mathbf{r}_{D/A} = -r\mathbf{j} - R\mathbf{k}$$

(*a*) Total angular velocity of disk *A*:

$$\boldsymbol{\omega} = \omega_1 \mathbf{j} + \boldsymbol{\omega}_{\text{disk}/F}$$

$$= \omega_x \mathbf{i} + \omega_1 \mathbf{j} + \omega_z \mathbf{k} \quad (1)$$

Denote by *D* point of contact of disks

Consider disk *B*: $\mathbf{v}_D = \omega_2 \mathbf{j} \times (-R\mathbf{k}) = -R\omega_2 \mathbf{i}$ (2)

Consider system *OC*, *OA* and disk *A*.

$$\mathbf{v}_{D'} = \mathbf{\Omega} \times \mathbf{r}_{B/A}$$

$$= \omega_1 \mathbf{j} \times (-r\mathbf{j} - R\mathbf{k})$$

$$= -R\omega_1 \mathbf{i}$$

$$\mathbf{v}_{B/F} = \omega_{\text{disk}/F} \times \mathbf{r}_{D/A}$$

$$= (\omega_2 \mathbf{i} + \omega_z \mathbf{k}) \times (-r\mathbf{j} - R\mathbf{k})$$

$$= -r\omega_x \mathbf{k} + R\omega_x \mathbf{j} + r\omega_z \mathbf{i}$$

$$\mathbf{v}_D = \mathbf{v}_{D'} + \mathbf{v}_{D/F}$$

$$= -R\omega_1 \mathbf{i} - r\omega_x \mathbf{k} + R\omega_x \mathbf{j} + r\omega_2 \mathbf{i} \quad (3)$$

Equate $\mathbf{v}_D = \mathbf{v}_D$ from Eq. (2) and Eq. (3).

$$-R\omega_2 \mathbf{i} = -R\omega_1 + r\omega_2 + R\omega_x \mathbf{j} - r\omega_x \mathbf{k}$$

PROBLEM 15.232

Using the method of Section 15.14, solve Problem 15.196.

PROBLEM 15.196 A 3-in.-radius disk spins at the constant rate $\omega_2 = 4$ rad/s about an axis held by a housing attached to a horizontal rod that rotates at the constant rate $\omega_1 = 5$ rad/s. Knowing that $\theta = 30°$, determine the acceleration of Point P on the rim of the disk.

SOLUTION

Let frame $Oxyz$ rotate with angular velocity

$$\mathbf{\Omega} = \omega_1 \mathbf{i} = (5 \text{ rad/s})\mathbf{i}$$

The motion relative to the frame is the spin

$$\omega_2 \mathbf{k} = (4 \text{ rad/s})\mathbf{k}$$

$$\theta = 30°$$

$$\mathbf{r}_P = (3 \text{ in.})(\cos 30°\mathbf{i} + \sin 30°\mathbf{j})$$

$$\mathbf{v}_{P'} = \omega_1 \mathbf{i} \times \mathbf{r}_P$$

$$= 5\mathbf{i} \times (3\cos 30°\mathbf{i} + 3\sin 30°\mathbf{j})$$

$$= (7.5 \text{ in./s})\mathbf{k}$$

$$\mathbf{v}_{P/F} = \omega_2 \mathbf{k} \times \mathbf{r}_P$$

$$= 4\mathbf{k} \times (3\cos 30°\mathbf{i} + 3\sin 30°\mathbf{j})$$

$$= -(6 \text{ in./s})\mathbf{i} + (10.392 \text{ in./s})\mathbf{j}$$

$$\mathbf{a}_{P'} = \dot{\omega}_1 \mathbf{i} \times \mathbf{r}_P + \omega_1 \mathbf{i} \times \mathbf{v}_{P'}$$

$$= 0 + 5\mathbf{i} \times 7.5\mathbf{k}$$

$$= -(37.5 \text{ in./s}^2)\mathbf{j}$$

$$\mathbf{a}_{P/F} = \dot{\omega}_2 \mathbf{k} \times \mathbf{r}_P$$

$$= \omega_2 \mathbf{k} \times \mathbf{v}_{P/F}$$

$$= 0 + 4\mathbf{k} \times (-6\mathbf{i} + 10.392\mathbf{j})$$

$$= -(41.569 \text{ in./s}^2)\mathbf{i} - (24 \text{ in./s}^2)\mathbf{j}$$

$$\mathbf{a}_c = 2\mathbf{\Omega} \times \mathbf{v}_{P/F}$$

$$= (2)(5\mathbf{i}) \times (-6\mathbf{i} + 10.392\mathbf{j})$$

$$= (103.92 \text{ in./s}^2)\mathbf{k}$$

Acceleration at Point P. $\mathbf{a}_P = \mathbf{a}_{P'} + \mathbf{a}_{P/F} + \mathbf{a}_c$

$$\mathbf{a}_P = -(41.6 \text{ in./s}^2)\mathbf{i} - (61.5 \text{ in./s}^2)\mathbf{j} + (103.9 \text{ in./s}^2)\mathbf{k} \blacktriangleleft$$

	**PROBLEM 15.233** Using the method of Section 15.14, solve Problem 15.198. **PROBLEM 15.198** At the instant shown, the robotic arm *ABC* is being rotated simultaneously at the constant rate $\omega_1 = 0.15$ rad/s about the *y* axis, and at the constant rate $\omega_2 = 0.25$ rad/s about the *z* axis. Knowing that the length of arm *ABC* is 1 m, determine (*a*) the angular acceleration of the arm, (*b*) the velocity of Point *C*, (*c*) the acceleration of Point *C*.

SOLUTION

Geometry: Dimensions in meters.

$$\mathbf{r}_{C/A} = (1.0\cos 35°)\mathbf{i} + (1.0\sin 35°)\mathbf{j} = 0.81915\mathbf{i} + 0.57358\mathbf{j}$$

Angular velocities:

$$\boldsymbol{\omega}_1 = \omega_1\mathbf{j} = (0.15 \text{ rad/s})\mathbf{j} \qquad (\dot{\omega}_1 = 0)$$

$$\boldsymbol{\omega}_2 = \omega_2\mathbf{k} = (0.15 \text{ rad/s})\mathbf{k} \qquad (\dot{\omega}_2 = 0)$$

Use a frame of reference rotating about the *y*-axis.

Its angular velocity is $\quad \boldsymbol{\Omega} = \omega_1\mathbf{j} = (0.15 \text{ rad/s})\mathbf{j}$

(*a*) *Angular acceleration*:

$$\boldsymbol{\alpha} = \dot{\omega}_1\mathbf{j} + \dot{\omega}_2\mathbf{k} + \boldsymbol{\Omega}\times\boldsymbol{\omega}_2$$
$$= 0 + 0 + (0.15\mathbf{j})(0.25\mathbf{k})$$

$$\boldsymbol{\alpha} = (0.0375 \text{ rad/s}^2)\mathbf{i} \blacktriangleleft$$

Motion of coinciding Point C.

$$\mathbf{v}_{C'} = \boldsymbol{\Omega}\times\mathbf{r}_{C/A} = 0.15\mathbf{j}\times(0.81915\mathbf{i} + 0.57358\mathbf{j})$$
$$= -(0.12287 \text{ m/s})\mathbf{k}$$
$$\mathbf{a}_{C'} = \boldsymbol{\Omega}\times(\boldsymbol{\Omega}\times\mathbf{r}_{C/A}) = (0.15\mathbf{j})\times(-0.12287\mathbf{k})$$
$$= -(0.018431 \text{ m/s}^2)\mathbf{i}$$

Motion of C relative to the frame.

$$\mathbf{v}_{C/F} = \omega_2\mathbf{k}\times\mathbf{r}_{C/A} = 0.25\mathbf{k}(0.81915\mathbf{i} + 0.57358\mathbf{j})$$
$$= -(0.14339 \text{ m/s})\mathbf{i} + (0.20479 \text{ m/s})\mathbf{j}$$
$$\mathbf{a}_{C/F} = \omega_1\mathbf{k}\times\mathbf{v}_{C/F} = 0.25\mathbf{k}\times(-0.14339\mathbf{i} + 0.20479\mathbf{j})$$
$$= -(0.051198 \text{ m/s}^2)\mathbf{i} - (0.035848 \text{ m/s}^2)\mathbf{j}$$

PROBLEM 15.234

A disk of radius 120 mm rotates at the constant rate $\omega_2 = 5$ rad/s with respect to the arm AB, which itself rotates at the constant rate $\omega_1 = 3$ rad/s. For the position shown, determine the velocity and acceleration of Point C.

SOLUTION

Geometry. $\mathbf{r}_{C/A} = (0.195\text{ m})\mathbf{i} - (0.1)\mathbf{j}$

$\mathbf{r}_{C/B} = (0.12\text{ m})\mathbf{i}$

Let frame $Axyz$, which coincides with the fixed frame $AXYZ$ at the instant shown, be rotating about the y axis with constant angular velocity $\boldsymbol{\Omega} = \omega_1\mathbf{j} = (3\text{ rad/s})\mathbf{j}$. Then the motion relative to the frame consists of rotation about the axle B with a constant angular velocity $\boldsymbol{\omega}_2 = \omega_2\mathbf{k} = (5\text{ rad/s})\mathbf{k}$.

Motion of the coinciding Point C' in the frame.

$$\begin{aligned}\mathbf{v}_{C'} &= \boldsymbol{\Omega}\times\mathbf{r}_{C/A}\\ &= 3\mathbf{j}\times(0.195\mathbf{i} - 0.14\mathbf{j})\\ &= -(0.585\text{ m/s})\mathbf{k}\end{aligned}$$

$$\begin{aligned}\mathbf{a}_{C'} &= \boldsymbol{\Omega}\times\mathbf{v}_{C'}\\ &= 3\mathbf{j}\times(-0.585\mathbf{k})\\ &= -(1.755\text{ m/s}^2)\mathbf{i}\end{aligned}$$

Motion relative to the frame.

$$\begin{aligned}\mathbf{v}_{C/F} &= \boldsymbol{\omega}_2\times\mathbf{r}_{C/B}\\ &= 5\mathbf{k}\times 0.12\mathbf{i}\\ &= (0.6\text{ m/s})\mathbf{j}\end{aligned}$$

$$\begin{aligned}\mathbf{a}_{C/F} &= \boldsymbol{\omega}_2\times\mathbf{v}_{C/F}\\ &= 5\mathbf{k}\times(-0.6\mathbf{j})\\ &= -(3\text{ m/s}^2)\mathbf{i}\end{aligned}$$

Velocity of Point C. $\mathbf{v}_C = \mathbf{v}_{C'} + \mathbf{v}_{C/F}$

$\mathbf{v}_C = (0.600\text{ m/s})\mathbf{j} - (0.585\text{ m/s})\mathbf{k}$ ◀

Coriolis acceleration. $2\boldsymbol{\Omega}\times\mathbf{v}_{C/F} = (2)(3\mathbf{j})\times(0.6\mathbf{j}) = 0$

Acceleration of Point C. $\mathbf{a}_C = \mathbf{a}_{C'} + \mathbf{a}_{C/F} + 2\boldsymbol{\Omega}\times\mathbf{v}_{C/F}$

$\mathbf{a}_C = -1.7551\mathbf{i} - 3\mathbf{i} + 0$

$\mathbf{a}_C = -(4.76\text{ m/s}^2)\mathbf{i}$ ◀

PROBLEM 15.235

A disk of radius 120 mm rotates at the constant rate $\omega_2 = 5$ rad/s with respect to the arm AB, which itself rotates at the constant rate $\omega_1 = 3$ rad/s. For the position shown, determine the velocity and acceleration of Point D.

SOLUTION

Geometry.

$$\mathbf{r}_{D/A} = (0.075 \text{ m})\mathbf{i} - (0.26 \text{ m})\mathbf{j}$$

$$\mathbf{r}_{D/B} = -(0.12 \text{ m})\mathbf{j}$$

Let frame $AXYZ$, which coincides with the fixed frame $AXYZ$ at the instant shown, be rotating about the y axis with constant angular velocity $\mathbf{\Omega} = \omega_1\mathbf{j} = (3 \text{ rad/s})\mathbf{j}$. Then the motion relative to the frame consists of rotation about the axle B with a constant angular velocity $\boldsymbol{\omega}_2 = \omega_2\mathbf{k} = (5 \text{ rad/s})\mathbf{k}$.

Motion of the coinciding Point D' in the frame.

$$\mathbf{v}_{D'} = \mathbf{\Omega} \times \mathbf{r}_{D/A}$$
$$= 3\mathbf{j} \times (0.075\mathbf{i} - 0.26\mathbf{j})$$
$$= -(0.225 \text{ m/s})\mathbf{k}$$
$$\mathbf{a}_{D'} = \mathbf{\Omega} \times \mathbf{v}_{D'}$$
$$= 3\mathbf{j} \times (-0.225\mathbf{k})$$
$$= -(0.675 \text{ m/s}^2)\mathbf{i}$$

Motion relative to the frame.

$$\mathbf{v}_{D/F} = \boldsymbol{\omega}_2 \times \mathbf{r}_{D/B}$$
$$= 5\mathbf{k} \times (-0.12\mathbf{j})$$
$$= (0.6 \text{ m/s})\mathbf{i}$$
$$\mathbf{a}_{D/F} = \boldsymbol{\omega}_2 \times \mathbf{v}_{C/F}$$
$$= 5\mathbf{k} \times (0.6\mathbf{i})$$
$$= (3 \text{ m/s}^2)\mathbf{j}$$

Velocity of Point D.

$$\mathbf{v}_D = \mathbf{v}_{D'} + \mathbf{v}_{D/F} \qquad \mathbf{v}_D = (0.600 \text{ m/s})\mathbf{i} - (0.225 \text{ m/s})\mathbf{k} \blacktriangleleft$$

Coriolis acceleration.

$$2\mathbf{\Omega} \times \mathbf{v}_{D/F} = (2)(3\mathbf{j}) \times (0.6\mathbf{i}) = -(3.6 \text{ m/s}^2)\mathbf{k}$$

Acceleration of Point D.

$$\mathbf{a}_D = \mathbf{a}_{D'} + \mathbf{a}_{D/F} + 2\mathbf{\Omega} \times \mathbf{v}_{D/F}$$

$$\mathbf{a}_D = -(0.675 \text{ m/s}^2)\mathbf{i} + (3.00 \text{ m/s}^2)\mathbf{j} - (3.60 \text{ m/s}^2)\mathbf{k} \blacktriangleleft$$

PROBLEM 15.236

The arm AB of length 16 ft is used to provide an elevated platform for construction workers. In the position shown, arm AB is being raised at the constant rate $d\theta/dt = 0.25$ rad/s; simultaneously, the unit is being rotated about the Y axis at the constant rate $\omega_1 = 0.15$ rad/s. Knowing that $\theta = 20°$, determine the velocity and acceleration of Point B.

SOLUTION

Frame of reference. Let moving frame $Axyz$ rotate about the Y axis with angular velocity

$$\begin{aligned}\mathbf{\Omega} &= \omega_1\mathbf{j}\\ &= (0.15 \text{ rad/s})\mathbf{j}.\end{aligned}$$

Geometry.

$$\begin{aligned}\mathbf{r}_{B/A} &= -16\cos 20°\mathbf{i} + 16\sin 20°\mathbf{j}\\ &= -(15.035 \text{ ft})\mathbf{i} + (5.4723 \text{ ft})\mathbf{j}\end{aligned}$$

Place Point O on Y axis at same level as Point A.

$$\begin{aligned}\mathbf{r}_{B/O} &= \mathbf{r}_{B/A} + \mathbf{r}_{A/O}\\ &= \mathbf{r}_{B/A} + (2.5 \text{ ft})\mathbf{i}\\ &= -(12.535 \text{ ft})\mathbf{i} + (5.4723 \text{ ft})\mathbf{j}\end{aligned}$$

Motion of corresponding Point B′ in the frame.

$$\begin{aligned}\mathbf{v}_{B'} &= \mathbf{\Omega} \times \mathbf{r}_{B/O}\\ &= (0.15\mathbf{j}) \times -(12.535\mathbf{i} + 5.4723\mathbf{j})\\ &= (1.8803 \text{ ft/s})\mathbf{k}\\ \mathbf{a}_{B'} &= \mathbf{\Omega} \times \mathbf{v}_{B'}\\ &= (0.15\mathbf{j}) \times (1.8803\mathbf{k})\\ &= (0.28204 \text{ ft/s}^2)\mathbf{i}\end{aligned}$$

PROBLEM 15.237

The remote manipulator system (RMS) shown is used to deploy payloads from the cargo bay of space shuttles. At the instant shown, the whole RMS is rotating at the constant rate $\omega_1 = 0.03$ rad/s about the axis *AB*. At the same time, portion *BCD* rotates as a rigid body at the constant rate $\omega_2 = d\beta/dt = 0.04$ rad/s about an axis through *B* parallel to the *X* axis. Knowing that $\beta = 30°$, determine (*a*) the angular acceleration of *BCD*, (*b*) the velocity of *D*, (*c*) the acceleration of *D*.

SOLUTION

At the instant given, Points *A*, *B*, *C*, and *D* lie in a plane which is parallel to the *YZ* plane. The plane *ABCD* is rotating with angular velocity.

$$\mathbf{\Omega} = \omega_1 \mathbf{j}$$
$$= (0.03 \text{ rad/s})\mathbf{j} \qquad (\dot{\omega}_1 = 0)$$

Body *BCD* is rotating about an axis through *B* parallel to the *x*-axis at angular velocity.

$$\boldsymbol{\omega}_2 = \frac{d\beta}{dt}\mathbf{i} = (0.04 \text{ rad/s})\mathbf{i} \qquad (\dot{\omega}_2 = 0)$$

(*a*) *Angular acceleration of BCD.*

$$\boldsymbol{\alpha}_{BCD} = \dot{\omega}_1 \mathbf{j} + \dot{\omega}_2 \mathbf{i} + \mathbf{\Omega} \times \boldsymbol{\omega}_2$$
$$= 0 + 0 + (0.03\mathbf{j}) \times (0.04\mathbf{i})$$

$$\boldsymbol{\alpha}_{BCD} = -(0.0012 \text{ rad/s}^2)\mathbf{k} \blacktriangleleft$$

Let the plane of *BCD* be a rotating frame of reference rotating about *AB* with angular velocity $\mathbf{\Omega}$.

Geometry: $\beta = 30°$

$$\mathbf{r}_{D/B} = (6.5 \text{ m})(\sin\beta\mathbf{j} - \cos\beta\mathbf{k}) + (2.5 \text{ m})\mathbf{j} = (5.75 \text{ m})\mathbf{j} - (5.6292 \text{ m})\mathbf{k}$$

Motion of Point *D′* in the frame.

$$\mathbf{v}_{D'} = \mathbf{\Omega} \times \mathbf{r}_{D/B} = 0.03\mathbf{j} \times (3.25\mathbf{j} - 5.6292\mathbf{k})$$
$$= -(0.168875 \text{ m/s})\mathbf{i}$$
$$\mathbf{a}_{D'} = \mathbf{\Omega} \times \mathbf{v}_{D'} = (0.03\mathbf{j}) \times (-0.168875\mathbf{i})$$
$$= (0.0050662 \text{ m/s}^2)\mathbf{k}$$

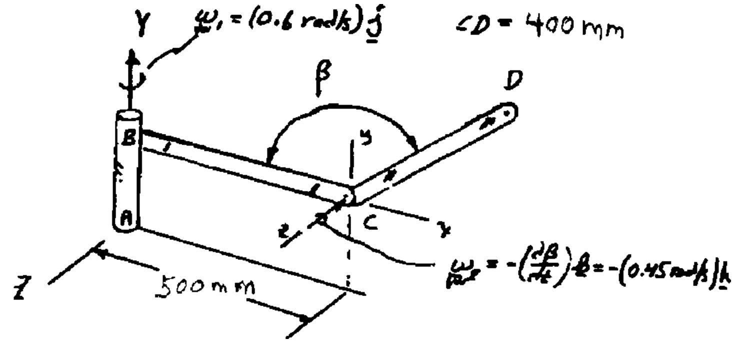
PROBLEM 15.238

The body *AB* and rod *BC* of the robotic component shown rotate at the constant rate $\omega_1 = 0.60$ rad/s about the *Y* axis. Simultaneously a wire-and-pulley control causes arm *CD* to rotate about *C* at the constant rate $\omega_2 = d\beta/dt = 0.45$ rad/s. Knowing that $\beta = 120°$, determine (*a*) the angular acceleration of arm *CD*, (*b*) the velocity of *D*, (*c*) the acceleration of *D*.

SOLUTION



$$\boldsymbol{\Omega} = \boldsymbol{\omega}_1$$
$$= (0.6 \text{ rad/s})\mathbf{j}$$
$$\boldsymbol{\omega}_{D/F} = \boldsymbol{\omega}_2$$
$$= -(0.45 \text{ rad/s})\mathbf{k}$$
$$\boldsymbol{\omega} = \boldsymbol{\omega}_1 + \boldsymbol{\omega}_2$$
$$= (0.6 \text{ rad/s})\mathbf{j} - (0.45 \text{ rad/s})\mathbf{k}$$

(*a*) Angular acceleration of *CD*.

$$\boldsymbol{\alpha} = \boldsymbol{\Omega} \times \boldsymbol{\omega}$$
$$= (0.6 \text{ rad/s})\mathbf{j} \times [(0.6 \text{ rad/s})\mathbf{j} - (0.45 \text{ rad/s})\mathbf{k}]$$

$$\boldsymbol{\alpha} = -(0.27 \text{ rad/s}^2)\mathbf{i} \blacktriangleleft$$

For $\beta = 120°$:

$$\mathbf{r}_{D/C} = (400 \text{ mm})\sin 30°\mathbf{i} + (400 \text{ mm})\cos 30°\mathbf{j}$$
$$= (200 \text{ mm})\mathbf{i} + (346.41 \text{ mm})\mathbf{j}$$
$$\mathbf{r}_{D/B} = (500 \text{ mm})\mathbf{i} + \mathbf{r}_{D/C}$$
$$= (700 \text{ mm})\mathbf{i} + (346.41 \text{ mm})\mathbj$$

PROBLEM 15.239

The crane shown rotates at the constant rate $\omega_1 = 0.25$ rad/s; simultaneously, the telescoping boom is being lowered at the constant rate $\omega_2 = 0.40$ rad/s. Knowing that at the instant shown the length of the boom is 20 ft and is increasing at the constant rate $u = 1.5$ ft/s, determine the velocity and acceleration of Point *B*.

SOLUTION

Geometry.

$$\mathbf{r}_{B/A} = \mathbf{r}_B$$
$$= (20\text{ ft})(\sin 30°\mathbf{j} + \cos 30°\mathbf{k})$$
$$= (10\text{ ft})\mathbf{j} + (10\sqrt{3}\text{ ft})\mathbf{k}$$

Method 1

Let the unextending portion of the boom *AB* be a rotating frame of reference.

Its angular velocity is

$$\mathbf{\Omega} = \omega_2\mathbf{i} + \omega_1\mathbf{j}$$
$$= (0.40\text{ rad/s})\mathbf{i} + (0.25\text{ rad/s})\mathbf{j}.$$

Its angular acceleration is

$$\boldsymbol{\alpha} = \omega_1\mathbf{j} \times \omega_2\mathbf{i}$$
$$= -\omega_1\omega_2\mathbf{k}$$
$$= -(0.10\text{ rad/s}^2)\mathbf{k}.$$

Motion of the coinciding Point B′ in the frame.

$$\mathbf{v}_{B'} = \mathbf{\Omega} \times \mathbf{r}_B$$
$$= (0.40\mathbf{i} + 0.25\mathbf{j}) \times (10\mathbf{j} + 10\sqrt{3}\mathbf{k})$$
$$= (2.5\sqrt{3}\text{ ft/s})\mathbf{i} - (4\sqrt{3}\text{ ft/s})\mathbf{j} + (4\text{ ft/s})\mathbf{k}$$

$$\mathbf{a}_{B'} = \boldsymbol{\alpha} \times \mathbf{r}_B + \mathbf{\Omega} \times \mathbf{v}_{B'}$$

$$= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 0 & 0 & -0.10 \\ 0 & 10 & 10\sqrt{3} \end{vmatrix} + \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 0.40 & 0.25 & 0 \\ 2.5\sqrt{3} & -4\sqrt{3} & 4 \end{vmatrix}$$

$$\mathbf{i} + \mathbf{i} - 1.6\mathbf{j} - 3.8538\mathbf{k} = (2\text{ ft/s}^2)\mathbf{i} - (1.6\text{ ft/s}^2)\mathbf{j} - (3.8538\text{ ft/s}^2)\mathbf{k}$$

Motion relative to the frame.

$$\mathbf{v}_{B/F} = u(\sin 30°\mathbf{j} + \cos 30°\mathbf{k})$$
$$= (1.5\text{ ft/s})\sin 30°\mathbf{j} + (1.5\text{ ft/s})\cos 30°\mathbf{k}$$
$$\mathbf{a}_{B/F} = 0$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

Velocity of Point B. $\mathbf{v}_B = \mathbf{v}_{B'} + \mathbf{v}_{B/F}$

$$\mathbf{v}_B = 2.5\sqrt{3}\mathbf{i} - 4\sqrt{3}\mathbf{j} + 4\mathbf{k} + 1.5\sin 30°\mathbf{j} + 1.5\cos 30°\mathbf{k}$$

$$\mathbf{v}_B = (4.33 \text{ ft/s})\mathbf{i} - (6.18 \text{ ft/s})\mathbf{j} + (5.30 \text{ ft/s})\mathbf{k} \blacktriangleleft$$

Coriolis acceleration. $2\mathbf{\Omega} \times \mathbf{v}_{B/F}$

$$2\mathbf{\Omega} \times \mathbf{v}_{B/F} = (2)(0.40\mathbf{i} + 0.25\mathbf{j}) \times (1.5\sin 30°\mathbf{j} + 1.5\cos 30°\mathbf{k})$$

$$= (0.64952 \text{ ft/s}^2)\mathbf{i} - (1.03923 \text{ ft/s}^2)\mathbf{j} + (0.6 \text{ ft/s}^2)\mathbf{k}$$

Acceleration of Point B. $\mathbf{a}_B = \mathbf{a}_{B'} + \mathbf{a}_{B/F} + 2\mathbf{\Omega} \times \mathbf{v}_{B/F}$

$$\mathbf{a}_B = (2 + 0.64952)\mathbf{i} - (1.6 + 1.03923\mathbf{j}) + (-3.8538 + 0.6)\mathbf{k}$$

$$\mathbf{a}_B = (2.65 \text{ ft/s}^2)\mathbf{i} - (2.64 \text{ ft/s}^2)\mathbf{j} - (3.25 \text{ ft/s}^2)\mathbf{k} \blacktriangleleft$$

Method 2

Let frame $Axyz$, which at the instant shown coincides with $AXYZ$, rotate with an angular velocity $\mathbf{\Omega}_1 = \omega_1\mathbf{j} = (0.25 \text{ rad/s})\mathbf{j}$. Then the motion relative to this frame consists of turning the boom relative to the cab and extending the boom.

Motion of the coinciding Point B′ in the frame.

$$\mathbf{v}_{B'} = \mathbf{\Omega} \times \mathbf{r}_B$$
$$= 0.25\mathbf{j} \times (10\mathbf{j} + 10\sqrt{3}\mathbf{k})$$
$$= (2.5\sqrt{3} \text{ m/s})\mathbf{i}$$
$$\mathbf{a}_{B'} = \mathbf{\Omega} \times \mathbf{v}_{B'}$$
$$= 0.25\mathbf{j} \times (2.5\sqrt{3}\mathbf{i})$$
$$= -(0.625\sqrt{3} \text{ m/s}^2)\mathbf{k}$$

Motion of Point B relative to the frame.

Let the unextending portion of the boom be a rotating frame with constant angular velocity $\mathbf{\Omega}_2 = \omega_2\mathbf{i} = (0.40 \text{ rad/s})\mathbf{i}$. The motion relative to this frame is the extensional motion with speed u.

$$\mathbf{v}_{B''} = \mathbf{\Omega}_2 \times \mathbf{r}_B$$
$$= 0.40\mathbf{i} \times (10\mathbf{j} + 10\sqrt{3}\mathbf{k})$$
$$= -(4\sqrt{3} \text{ ft/s})\mathbf{j} + (4 \text{ ft/s})\mathbf{k}$$
$$\mathbf{a}_{B''} = \mathbf{\Omega}_2 \times \mathbf{v}_{B''}$$
$$= 0.40\mathbf{i} \times (-4\sqrt{3}\mathbf{j} + 4\mathbf{k})$$
$$= -(1.6 \text{ ft/s}^2)\mathbf{j} - (1.6\sqrt{3} \text{ ft/s}^2)\mathbf{k}$$
$$\mathbf{v}_{B/\text{boom}} = u(\sin 30°\mathbf{j} + \cos 30°\mathbf{k})$$
$$= (1.5 \text{ ft/s})\sin 30°\mathbf{j} + (1.5 \text{ ft/s})\cos 30°\mathbf{k}$$
$$\mathbf{a}_{B/\text{boom}} = 0$$

PROBLEM 15.240

The vertical plate shown is welded to arm *EFG*, and the entire unit rotates at the constant rate $\omega_1 = 1.6$ rad/s about the *Y* axis. At the same time, a continuous link belt moves around the perimeter of the plate at a constant speed $u = 4.5$ in./s. For the position shown, determine the acceleration of the link of the belt located (*a*) at Point *A*, (*b*) at Point *B*.

SOLUTION

Let the moving frame of reference be the unit, less the pulleys and belt. It rotates about the *Y* axis with constant angular velocity $\mathbf{\Omega} = \omega_1 \mathbf{j} = (1.6 \text{ rad/s})\mathbf{j}.$ The relative motion is that of the pulleys and belt with speed $u = 90$ mm/s.

(*a*) *Acceleration at Point A.*

$$\mathbf{r}_A = -(5 \text{ in.})\mathbf{i} + (19 \text{ in.})\mathbf{j}$$

$$\mathbf{v}_{A'} = \mathbf{\Omega} \times \mathbf{r}_A = 1.6\mathbf{j} \times (-5\mathbf{i} + 19\mathbf{j}) = (8 \text{ in./s})\mathbf{k}$$

$$\mathbf{a}_{A'} = \mathbf{\Omega} \times \mathbf{v}_{A'} = 1.6\mathbf{j} \times 8\mathbf{k} = (12.8 \text{ in./s}^2)\mathbf{i}$$

$$\mathbf{v}_{A/F} = u\mathbf{k} = (4.5 \text{ in./s})\mathbf{k}$$

$$\mathbf{a}_{A/F} = -\left(\frac{u^2}{\rho}\right)\mathbf{j} = -\left(\frac{4.5^2}{3}\right)\mathbf{j} = -\left(6.75 \text{ in./s}^2\right)\mathbf{j}$$

$$2\mathbf{\Omega} \times \mathbf{v}_{A/F} = (2)(1.6\mathbf{j}) \times (4.5\mathbf{k}) = (14.4 \text{ in./s}^2)\mathbf{i}$$

$$\mathbf{a}_A = \mathbf{a}_{A'} + \mathbf{a}_{A/F} + 2\mathbf{\Omega} \times \mathbf{v}_{A/F} = 12.8\mathbf{i} - 6.75\mathbf{j} + 14.4\mathbf{i}$$

$$\mathbf{a}_A = (27.2 \text{ in./s}^2)\mathbf{i} - (6.75 \text{ in./s}^2)\mathbf{j} \blacktriangleleft$$

PROBLEM 15.244

A square plate of side $2r$ is welded to a vertical shaft which rotates with a constant angular velocity $\boldsymbol{\omega}_1$. At the same time, rod AB of length r rotates about the center of the plate with a constant angular velocity $\boldsymbol{\omega}_2$ with respect to the plate. For the position of the plate shown, determine the acceleration of end B of the rod if (*a*) $\theta = 0$, (*b*) $\theta = 90°$, (*c*) $\theta = 180°$.

SOLUTION

Use a frame of reference moving with the plate.

Its angular velocity is $\boldsymbol{\Omega} = \omega_1 \mathbf{j} \qquad (\dot{\boldsymbol{\Omega}} = 0)$

Geometry:

$$\mathbf{r}_{A/O} = r(\sin 30°\mathbf{j} - \cos 30°\mathbf{k})$$

$$\mathbf{r}_{B/O} = \mathbf{r}_{A/O} + \mathbf{r}_{B/A}$$

Acceleration of coinciding Point B' in the frame.

$$\mathbf{a}_{B'} = \boldsymbol{\Omega} \times (\boldsymbol{\Omega} \times \mathbf{r}_{B/O})$$

Motion relative to the frame. (Rotation about A with angular velocity $\boldsymbol{\omega}_2$).

$$\boldsymbol{\omega}_2 = \omega_2(\cos 30°\mathbf{j} + \sin 30°\mathbf{k}) \qquad (\dot{\omega}_2 = 0)$$

$$\mathbf{v}_{B/F} = \boldsymbol{\omega}_2 \times \mathbf{r}_{B/A}$$

$$\mathbf{a}_{B/F} = \boldsymbol{\omega}_2 \times \mathbf{v}_{B/F} = -\omega_2^2 \mathbf{r}_{B/A}$$

Coriolis acceleration: $\quad 2\boldsymbol{\Omega} \times \mathbf{v}_{B/F}$

Acceleration of B. $\quad \mathbf{a}_B = \mathbf{a}_{B'} + \mathbf{a}_{B/F} + 2\boldsymbol{\Omega} \times \mathbf{v}_{B/F}$

(*a*) $\quad \theta = 0$

$$\mathbf{r}_{B/A} = r(-\sin 30°\mathbf{j} + \cos 30°\mathbf{k})$$

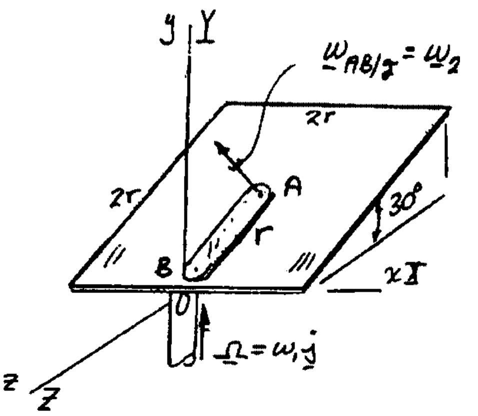
$$\mathbf{r}_{B/O} = 0$$

$$\mathbf{a}_{B'} = 0$$

$$\mathbf{v}_{B/F} = r\omega_2 \mathbf{i}$$

$$\mathbf{a}_{B/F} = -\omega_2^2 \mathbf{r}_{B/A} = r\omega_2^2(\sin 30°\mathbf{j} - \cos 30°\mathbf{k})$$

$$2\boldsymbol{\Omega} \times \mathbf{v}_{B/F} = 2(\omega_1 \mathbf{j}) \times (r\omega_2 \mathbf{i}) = -2r\omega_1\omega_2 \mathbf{k}$$



$$\mathbf{a}_B = \mathbf{a}_{B'} + \mathbf{a}_{B/F} + \mathbf{a}_C$$

$$= 0 + r\omega_2^2(\sin 30°\mathbf{j} - \cos 30°\mathbf{k}) - 2r\omega_1\omega_2\mathbf{k}$$

$$\mathbf{a}_B = r\omega_2^2 \sin 30°\mathbf{j} - (r\omega_2^2 \cos 30° + 2r\omega_1\omega_2)\mathbf{k} \quad \blacktriangleleft$$

PROBLEM 15.245

Two disks, each of 130-mm radius, are welded to the 500-mm rod *CD*. The rod-and-disks unit rotates at the constant rate $\omega_2 = 3$ rad/s with respect to arm *AB*. Knowing that at the instant shown $\omega_1 = 4$ rad/s, determine the velocity and acceleration of (*a*) Point *E*, (*b*) Point *F*.

SOLUTION

Let the frame of reference *BXYZ* be rotating about the *Y* axis with angular velocity $\mathbf{\Omega} = \omega_2\mathbf{j} = (4 \text{ rad/s})\mathbf{j}$. The motion relative to this frame is a rotation about the *X* axis with angular velocity $\omega_x\mathbf{i} = (3 \text{ rad/s})\mathbf{i}$.

(*a*) *Point E.*

$$\mathbf{r}_{E/B} = (0.25 \text{ m})\mathbf{i} + (0.13 \text{ m})\mathbf{j}$$

$$\mathbf{r}_{E/D} = (0.13 \text{ m})\mathbf{j}$$

Motion of Point E′ in the frame.

$$\begin{aligned} \mathbf{v}_{E'} &= \mathbf{\Omega} \times \mathbf{r}_{E/B} \\ &= 4\mathbf{j} \times (0.25\mathbf{i} + 0.13\mathbf{j}) \\ &= -(1 \text{ m/s})\mathbf{k} \end{aligned}$$

$$\begin{aligned} \mathbf{a}_{E'} &= \mathbf{\Omega} \times \mathbf{v}_{E'} \\ &= 4\mathbf{j} \times (-\mathbf{k}) \\ &= -(4 \text{ m/s}^2)\mathbf{i} \end{aligned}$$

Motion of Point E relative to the frame.

$$\begin{aligned} \mathbf{v}_{E/F} &= \omega_x\mathbf{i} \times \mathbf{r}_{E/D} \\ &= 3\mathbf{i} \times 0.13\mathbf{j} \\ &= (0.39 \text{ m/s})\mathbf{k} \end{aligned}$$

$$\begin{aligned} \mathbf{a}_{E/F} &= \omega_x\mathbf{i} \times \mathbf{v}_{E/F} \\ &= 3\mathbf{i} \times (0.39\mathbf{k}) \\ &= -(1.17 \text{ m/s}^2)\mathbf{j} \end{aligned}$$

Coriolis acceleration.

$$\mathbf{a}_c = 2\mathbf{\Omega} \times \mathbf{v}_{E/F}$$

$$\mathbf{a}_c = (2)(4\mathbf{j}) \times (0.39\mathbf{k}) = (3.12 \text{ m/s}^2)\mathbf{i}$$

Velocity of Point E.

$$\mathbf{v}_E = \mathbf{v}_{E'} + \mathbf{v}_{E/F}$$

$$\mathbf{v}_E = -\mathbf{k} + 0.39\mathbf{k} = 0.61\mathbf{k}$$

$$\mathbf{v}_E = (0.610 \text{ m/s})\mathbf{k} \blacktriangleleft$$

Acceleration of Point E.

$$\mathbf{a}_E = \mathbf{a}_{E'} + \mathbf{a}_{E/F} + \mathbf{a}_c$$

$$\mathbf{a}_E = -4\mathbf{i} - 1.17\mathbf{j} + 3.12\mathbf{i}$$

$$\mathbf{a}_E = -(0.880 \text{ m/s}^2)\mathbf{i} + (1.170 \text{ m/s}^2)\mathbf{j} \blacktriangleleft$$

PROBLEM 15.247

The position of the stylus tip A is controlled by the robot shown. In the position shown the stylus moves at a constant speed $u = 180$ mm/s relative to the solenoid BC. At the same time, arm CD rotates at the constant rate $\omega_2 = 1.6$ rad/s with respect to component DEG. Knowing that the entire robot rotates about the X axis at the constant rate $\omega_1 = 1.2$ rad/s, determine (*a*) the velocity of A, (*b*) the acceleration of A.

SOLUTION

Geometry:

$$\mathbf{r}_{D/G} = -(500\text{ mm})\mathbf{i} + (300\text{ mm})\mathbf{j} + (600\text{ mm})\mathbf{k}$$

$$\mathbf{r}_{A/D} = -(250\text{ mm})\mathbf{i} + (600\text{ mm})\mathbf{k}$$

$$\mathbf{r}_{A/G} = \mathbf{r}_{A/D} + \mathbf{r}_{D/G} = -(750\text{ mm})\mathbf{i} + (300\text{ mm})\mathbf{j} + (600\text{ mm})\mathbf{k}$$

Angular velocities:

$$\boldsymbol{\omega}_1 = \omega_1\mathbf{i} = (1.2\text{ rad/s})\mathbf{i} \qquad (\dot{\omega}_1 = 0)$$

$$\boldsymbol{\omega}_2 = \omega_2\mathbf{j} = (1.6\text{ rad/s})\mathbf{j} \qquad (\dot{\omega}_2 = 0)$$

Stylus motion:

$$\mathbf{u} = -u\mathbf{i} = -(180\text{ mm/s})\mathbf{i} \qquad (\dot{u} = 0)$$

Method 1

Let the rigid body BCD be a rotating frame of reference.

Its angular velocity is $\boldsymbol{\omega}_{CD} = \boldsymbol{\omega}_1 + \boldsymbol{\omega}_2 = (1.2\text{ rad/s})\mathbf{i} + (1.6\text{ rad/s})\mathbf{j}$

Its angular acceleration is

$$\boldsymbol{\alpha}_{CD} = \boldsymbol{\omega}_1 \times \boldsymbol{\omega}_{CD} = (1.2\text{ rad/s})\mathbf{i} \times [(1.2\text{ rad/s})\mathbf{i} + (1.6\text{ rad/s})\mathbf{j}]$$
$$= (1.92\text{ rad/s}^2)\mathbf{k}$$

Motion of the coinciding Point A' in the frame.

$$\mathbf{v}_{A'} = \mathbf{v}_D + \mathbf{v}_{A'/D}$$

$$\mathbf{v}_{A'} = \boldsymbol{\omega}_1 \times \mathbf{r}_{D/G} + (\boldsymbol{\omega}_1 + \boldsymbol{\omega}_2) \times \mathbf{r}_{A/D}$$
$$= (1.2\text{ rad/s})\mathbf{i} \times [-(500\text{ mm})\mathbf{i} + (300\text{ mm})\mathbf{j}]$$
$$+ [(1.2\text{ rad/s})\mathbf{i} + (1.6\text{ rad/s})\mathbf{j}] \times [-(250\text{ mm})\mathbf{i} + (600\text{ mm})\mathbf{k}]$$
$$= (360\text{ mm/s})\mathbf{k} - (720\text{ mm/s})\mathbf{j} + (400\text{ mm/s})\mathbf{k} + (960\text{ mm/s})\mathbf{i}$$

$$\mathbf{v}_{A'} = (960\text{ mm/s})\mathbf{i} - (720\text{ mm/s})\mathbf{j} + (760\text{ mm/s})\mathbf{k}$$

$$\mathbf{a}_D = \omega_1 \times (\boldsymbol{\omega}_1 \times \mathbf{r}_{D/G})$$
$$= (1.2\text{ rad/s})\mathbf{i} \times \{(1.2\text{ rad/s})\mathbf{i} \times [-(500\text{ mm})\mathbf{i} + (300\text{ mm})\mathbf{j}]\}$$
$$= -(432\text{ mm/s}^2)\mathbf{j}$$

$$\mathbf{a}_{A'/D} = \boldsymbol{\alpha}_{CD} \times \mathbf{r}_{A/D} + \boldsymbol{\omega}_{CD} \times (\boldsymbol{\omega}_{CD} \times \mathbf{r}_{A/D})$$
$$= (1.92\text{ rad/s}^2)\mathbf{k} \times [-(250\text{ mm})\mathbf{i} + (600\text{ mm})\mathbf{k}]$$
$$+ \boldsymbol{\omega}_{CD} \times \{[(1.2\text{ rad/s})\mathbf{i} + (1.6\text{ rad/s})\mathbf{j}] \times [-(250\text{ mm})\mathbf{i} + (600\text{ mm})\mathbf{k}]\}$$

$$\mathbf{a}_{A'/D} = (640\text{ mm/s}^2)\mathbf{i} - (960\text{ mm/s}^2)\mathbf{j} - (2400\text{ mm/s}^2)\mathbf{k}$$

$$\mathbf{a}_{A'} = \mathbf{a}_D + \mathbf{a}_{A'/D}$$

$$\mathbf{a}_{A'} = (640\text{ mm/s}^2)\mathbf{i} - (1392\text{ mm/s}^2)\mathbf{j} - (2400\text{ mm/s}^2)\mathbf{k}$$

Motion of Point A relative to the frame.

$$\mathbf{v}_{A/F} = \mathbf{u} = -(180\text{ mm/s})\mathbf{i}$$

$$\mathbf{a}_{A/F} = 0$$

(*a*) *Velocity of A.* $\mathbf{v}_A = \mathbf{v}_{A'} + \mathbf{v}_{A/F}$

$$\mathbf{v}_A = (960\text{ mm/s})\mathbf{i} - (720\text{ mm/s})\mathbf{j} + (760\text{ mm/s})\mathbf{k} - (180\text{ mm/s})\mathbf{i}$$

$$\mathbf{v}_A = (0.78\text{ m/s})\mathbf{i} - (0.72\text{ m/s})\mathbf{j} + (0.76\text{ m/s})\mathbf{k}$$ ◀

Coriolis acceleration: $\mathbf{a}_c = 2\boldsymbol{\omega}_{CD} \times \mathbf{v}_{A/F}$

$$\mathbf{a}_c = 2[(1.2\text{ rad/s})\mathbf{i} + (1.6\text{ rad/s})\mathbf{j}] \times (-180\text{ mm/s})\mathbf{i}$$

$$= +(576\text{ mm/s}^2)\mathbf{k}$$

(*b*) *Acceleration of A.* $\mathbf{a}_A = \mathbf{a}_{A'} + \mathbf{a}_{A/F} + \mathbf{a}_c$

$$\mathbf{a}_A = (640\text{ mm/s}^2)\mathbf{i} - (1392\text{ mm/s}^2)\mathbf{j} - (2400\text{ mm/s}^2)\mathbf{k} + (576\text{ mm/s}^2)\mathbf{k}$$

$$\mathbf{a}_A = (0.64\text{ m/s}^2)\mathbf{i} - (1.392\text{ m/s}^2)\mathbf{j} - (1.824\text{ m/s}^2)\mathbf{k}$$ ◀

Method 2

Use a frame of reference rotating about the x axis with angular velocity.

$$\boldsymbol{\omega}_1 = \omega_1\mathbf{i} = (1.2\text{ rad/s})\mathbf{i} \qquad (\dot{\omega}_1 = 0)$$

Motion of coinciding Point A' in the frame.

$$\mathbf{v}_{A'} = \boldsymbol{\omega}_1 \times \mathbf{r}_{A/G} = (1.2\text{ rad/s})\mathbf{i} \times [-(500\text{ mm})\mathbf{i} + (300\text{ mm})\mathbf{j} + (600\text{ mm})\mathbf{k}]$$

$$= (360\text{ mm/s})\mathbf{k} - (720\text{ mm/s})\mathbf{j}$$

$$\mathbf{a}_{A'} = \omega_1 \times (\boldsymbol{\omega}_1 \times \mathbf{r}_{A/G}) = \boldsymbol{\omega}_1 \times \mathbf{v}_{A'}$$

$$= (1.2\text{ rad/s})\mathbf{i} \times [(360\text{ mm/s})\mathbf{k} - (720\text{ mm/s})\mathbf{j}]$$

$$= -(432\text{ mm/s}^2)\mathbf{j} - (864\text{ mm/s}^2)\mathbf{k}$$

PROBLEM 15.248

The angular acceleration of the 600-mm-radius circular plate shown is defined by the relation $\alpha = \alpha_0 e^{-t}$. Knowing that the plate is at rest when $t = 0$ and that $\alpha_0 = 10 \text{ rad/s}^2$, determine the magnitude of the total acceleration of Point B when (a) $t = 0$, (b) $t = 0.5$ s, (c) $t = \infty$.

SOLUTION

$$\alpha = \frac{d\omega}{dt} = \alpha_0 e^{-t}; \quad \int_0^\omega d\omega = \int_0^t \alpha_0 e^{-t} dt$$

$$\omega = \alpha_0 \left| -e^{-t} \right|_0^t \qquad \omega = \alpha_0 (1 - e^{-t})$$

$$a_t = r\alpha = r\alpha_0 e^{-t} = (0.6 \text{ m})(10 \text{ rad/s}^2)e^{-t} = 6e^{-t}$$

$$a_n = r\omega^2 = r\alpha_0^2 (1 - e^{-t})^2 = (0.6)(10)^2 (1 - e^{-t})^2 = 60(1 - e^{-t})^2$$

(a) $t = 0$:

$$a_t = 6e^0 = 6 \text{ m/s}^2$$

$$a_n = 60(1 - e^0)^2 = 0$$

$$a_B^2 = a_t^2 + a_n^2 = 6^2$$

$a_B = 6.00 \text{ m/s}^2$ ◀

(b) $t = 0.5$ s:

$$a_t = 6e^{-0.5} = 6(0.6065) = 3.639 \text{ m/s}^2$$

$$a_n = 60(1 - e^{-0.5})^2$$

$$= 60(1 - 0.6065)^2$$

$$= 9.289 \text{ m/s}^2$$

$$a_B^2 = a_t^2 + a_n^2 = (3.639)^2 + (9.289)^2$$

$a_B = 9.98 \text{ m/s}^2$ ◀

(c) $t = \infty$:

$$a_t = 6e^{-\infty} = 0$$

$$a_n = 60(1 - e^{-\infty})^2 = 60 \text{ m/s}^2$$

$$a_B^2 = a_t^2 + a_n^2 = 0 + 60^2$$

$a_B = 60.0 \text{ m/s}^2$ ◀

PROBLEM 15.249

Cylinder A is moving downward with a velocity of 9 ft/s when the brake is suddenly applied to the drum. Knowing that the cylinder moves 18 ft downward before coming to rest and assuming uniformly accelerated motion, determine (a) the angular acceleration of the drum, (b) the time required for the cylinder to come to rest.

SOLUTION

Block A:

$$v^2 - v_0^2 = 2as$$

$$0 - (9\text{ ft/s})^2 = 2a\,(18\text{ ft})$$

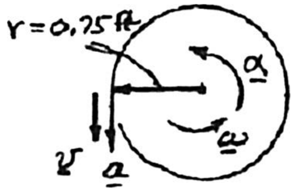
$$a = -2.25\text{ ft/s}^2 \qquad \mathbf{a} = 2.25\text{ ft/s}^2 \uparrow$$

Drum:

$$v_A = r\omega_0$$

$$9\text{ ft/s} = (0.75\text{ ft})\omega$$

$$\omega_0 = 12\text{ rad/s}$$



(a) $a = r\alpha$

$$-(2.25\text{ ft/s}^2) = (0.75\text{ ft})\alpha$$

$$\alpha = -3\text{ rad/s}^2 \qquad \boldsymbol{\alpha} = 3.00\text{ rad/s}^2 \circlearrowright \blacktriangleleft$$

(b) Uniformly accelerated motion. $\omega = 0$ when $t = t_1$

$$\omega = \omega_0 + \alpha t: \quad 0 = (12\text{ rad/s}) - (3\text{ rad/s}^2)t_1 \qquad t_1 = 4.00\text{ s} \blacktriangleleft$$

PROBLEM 15.250

A baseball pitching machine is designed to deliver a baseball with a ball speed of 70 mph and a ball rotation of 300 rpm clockwise. Knowing that there is no slipping between the wheels and the baseball during the ball launch, determine the angular velocities of wheels *A* and *B*.

SOLUTION

Let Point *G* be the center of the ball, *A* its contact point with wheel *A*, and *B* its contact point with wheel *B*.

Given: $$v_G = \left(70\frac{\text{m}}{\text{h}}\right)\left(\frac{1\text{ h}}{3600\text{ s}}\right)\left(\frac{5280\text{ ft}}{\text{mi}}\right) = 102.667\text{ ft/s} = 1232\text{ in./s}$$

$$\omega_{\text{ball}} = (300\text{ rpm})\left(\frac{2\pi\text{ rad}}{\text{rev}}\right)\left(\frac{1\text{ min}}{60\text{ s}}\right) = 10\pi\text{ rad/s}$$

$$\mathbf{v}_G = 1232\text{ in./s} \longrightarrow \qquad \boldsymbol{\omega}_{\text{ball}} = 10\pi\text{ rad/s} \circlearrowright$$

Unit vectors: $\mathbf{i} = 1 \longrightarrow, \quad \mathbf{j} = 1\uparrow, \quad \mathbf{k} = 1 \circlearrowleft$

Relative positions: $$\mathbf{r}_{A/G} = \frac{1}{2}(-3\mathbf{j}) = -(1.5\text{ in.})\mathbf{j}$$

$$\mathbf{r}_{B/G} = \frac{1}{2}(3\mathbf{j}) = (1.5\text{ in.})\mathbf{j}$$

Velocities at *A* and *B*.
$$\mathbf{v}_A = \mathbf{v}_G + \boldsymbol{\omega}_{\text{ball}} \times \mathbf{r}_{A/G} = 1232\mathbf{i} + (-10\pi\mathbf{k}) \times (1.5\mathbf{j})$$
$$= (1232 + 47.12)\mathbf{i} = 1279.12\text{ in./s} \longrightarrow$$

$$\mathbf{v}_B = \mathbf{v}_G + \boldsymbol{\omega}_{\text{ball}} \times \mathbf{r}_{B/G} = 1232\mathbf{i} + (-10\pi\mathbf{k}) \times (1.5\pi\mathbf{j})$$
$$= (1232 - 47.12)\mathbf{i} = 1184.88\text{ in./s} \longrightarrow$$

Angular velocity of A.
$$\omega_A = \frac{v_A}{r_A} = \frac{1184.88}{7} = 169.27\text{ rad/s}$$

$$\boldsymbol{\omega}_A = 1616\text{ rpm} \circlearrowright \blacktriangleleft$$

Angular velocity of B.

$$\omega_B = \frac{v_B}{r_B} = \frac{1279.12}{7} = 182.73\text{ rad/s} \circlearrowleft$$

$$\boldsymbol{\omega}_B = 1745\text{ rpm} \circlearrowleft \blacktriangleleft$$

PROBLEM 15.251

Knowing that inner gear A is stationary and outer gear C starts from rest and has a constant angular acceleration of 4 rad/s^2 clockwise, determine at $t = 5$ s (a) the angular velocity of arm AB, (b) the angular velocity of gear B, (c) the acceleration of the point on gear B that is in contact with gear A.

SOLUTION

Angular velocity of gear C at $t = 5$ s.

$$\omega_c = \alpha_c t = (4 \text{ rad/s}^2)(5 \text{ s}) = 20 \text{ rad/s} \qquad \boldsymbol{\omega}_c = 20 \text{ rad/s} \circlearrowright$$

Let Point 1 be the contact point between gears A and B. Let Point 2 be the contact point between gears B and C. Points A, B, and C are the centers, respectively, of gears A, B, and C.

Positions: Take x axis along the straight line A1 B2.

$$x_A = x_C = 0$$
$$x_1 = r_A = 80 \text{ mm}$$
$$x_B = (80 \text{ mm} + 40 \text{ mm}) = 120 \text{ mm}$$
$$x_2 = 120 \text{ mm} + 80 \text{ mm} = 200 \text{ mm}$$

Velocity at 1. Since gear A is stationary, $v_1 = 0$.

Velocity at 2. $v_2 = x_2 \omega_C = (200)(20)$

$$\mathbf{v}_2 = 4000 \text{ mm/s} \downarrow$$

Point 1 is the instantaneous center of gear B.

$$v_2 = (x_2 - x_1)\omega_B = (120 \text{ mm})\omega_B$$
$$\omega_B = \frac{v_2}{120} = \frac{4000}{120} = 33.333 \text{ rad/s}$$
$$v_B = (x_B - x_1)\omega_B = (40 \text{ mm})(33.333 \text{ rad/s}) = 1333.33 \text{ mm/s}$$
$$\omega_{AB} = \frac{v_B}{x_B} = \frac{1333.33}{120} = 11.111 \text{ rad/s}$$

(a) *Angular velocity of arm AB*: $\boldsymbol{\omega}_{AB} = 11.11 \text{ rad/s} \circlearrowright$ ◀

(b) *Angular velocity of gear B*: $\boldsymbol{\omega}_B = 33.3 \text{ rad/s} \circlearrowright$ ◀

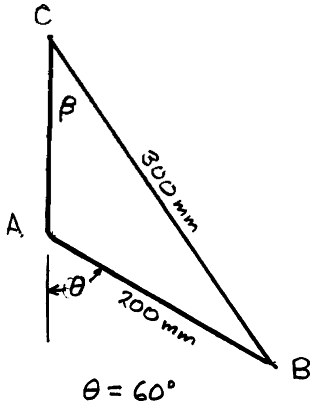
PROBLEM 15.254

Rod AB is attached to a collar at A and is fitted with a wheel at B that has a radius r = 15 mm. Knowing that when $\theta = 60°$ the colar has velocity of 250 mm/s upward and the speed of the collar is decreasing at a rate of 150 mm/s^2, determine (*a*) the angular acceleration of rod AB, (*b*) the angular acceleration of the wheel.

SOLUTION

Geometry. We note that Point B moves on a circle of radius R = 300 mm centered at C. It is useful to use the angle β, angle ACB of the triangle ABC, which indicates the motion of B along this curve. Applying the law of sines to the triangle ABC,



$$\frac{\overline{AB}}{\sin(\pi-\theta)} = \frac{\overline{BC}}{\sin\beta} \qquad (\theta = 60°)$$

or
$$\sin\beta = \frac{\overline{AB}}{\overline{BC}}\sin\theta = \frac{200 \text{ mm}}{300 \text{ mm}}\sin 60°$$
$$\beta = 35.264°$$

With meters as the length unit and the unit vectors defined as

$$\mathbf{i} = 1 \longrightarrow, \quad \mathbf{j} = 1\uparrow, \quad \text{and } \mathbf{k} = 1 \circlearrowleft$$

The relative position vectors are

$$\mathbf{r}_{B/A} = (0.2 \text{ m})(\sin 60°\mathbf{i} - \cos 60°\mathbf{j})$$
$$\mathbf{r}_{B/C} = (0.3 \text{ m})(\sin\beta\mathbf{i} - \cos\beta\mathbf{j})$$

Let Point P be the contact point where the wheel rolls on the fixed surface.

$$\mathbf{r}_{P/B} = (0.015 \text{ m})(\sin\beta\mathbf{i} - \cos\beta\mathbf{j})$$

Velocity analysis.
$$\mathbf{v}_A = 0.250 \text{ m/s}\uparrow \qquad \mathbf{v}_P = 0$$
$$\mathbf{v}_B = v_B \measuredangle\, \beta \qquad \boldsymbol{\omega}_{AB} = \omega_{AB}\mathbf{k} \qquad \boldsymbol{\omega}_{BP} = \omega_{BP}\mathbf{k}$$

$$\mathbf{v}_B = \mathbf{v}_A + \mathbf{v}_{B/A} = \mathbf{v}_A + \boldsymbol{\omega}_{AB} \times \mathbf{r}_{B/A}$$
$$= 0.250\mathbf{j} + (\omega_{AB})\mathbf{k} \times (0.2\sin 60°\mathbf{i} - 0.2\cos 60°\mathbf{j})$$
$$v_B(\cos\beta\mathbf{i} + \sin\beta\mathbf{j}) = 0.25\mathbf{j} + 0.1\omega_{AB}\mathbf{i} + 0.173205\omega_{AB}\mathbf{j}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

Resolve into components:

i: $v_B \cos\beta = +0.1\omega_{AB}$ (1)

j: $v_B \sin\beta = 0.25 - 0.173205\omega_{AB}$ (2)

Solving the simultaneous Equations (1) and (2),

$$v_B = -0.29873 \text{ m/s} \qquad \omega_{AB} = -2.43913$$

$$\mathbf{v}_B = 0.29873 \text{ m/s} \nearrow \beta \qquad \boldsymbol{\omega}_{AB} = 2.43913 \text{ rad/s} \circlearrowright$$

Since the wheel rolls without slipping, Point P is its instantaneous center.

$$|v_B| = r\omega_{BP} \qquad \omega_{PB} = \frac{0.29873}{0.15} \qquad \boldsymbol{\omega}_{BP} = 1.992 \text{ rad/s} \circlearrowright$$

Acceleration analysis $\mathbf{a}_A = 150 \text{ mm/s}^2 \downarrow$

$(\mathbf{a}_P)_t = 0$

$$\begin{aligned}
\mathbf{a}_B &= \mathbf{a}_A + \mathbf{a}_{B/A} = \mathbf{a}_A + \boldsymbol{\alpha}_{AB}\mathbf{k} \times \mathbf{r}_{B/A} - \omega_{AB}^2 \mathbf{r}_{B/A} \\
&= -0.150\mathbf{j} + \alpha_{AB}\mathbf{k} \times (0.2\sin 60°\mathbf{i} - 0.2\cos 60°\mathbf{j}) \\
&\quad - (2.43913)^2 (0.2\sin 60°\mathbf{i} - 0.2\cos 60°\mathbf{j}) \\
&= -0.150\mathbf{j} + (0.2\sin 60°)\alpha_{AB}\mathbf{j} + (0.2\cos 60°)\alpha_{AB}\mathbf{i} \\
&\quad - 1.03046\mathbf{i} + 0.59494\mathbf{j} \\
&= (0.2\cos 60°)\alpha_{AB}\mathbf{i} + (0.2\sin 60°)\alpha_{AB}\mathbf{j} - 1.03046\mathbf{i} + 0.44494\mathbf{j}
\end{aligned}$$

Consider the motion of B along its circular path.

$$\begin{aligned}
\mathbf{a}_B &= [(a_B)_t \measuredangle \beta] + \left[\frac{v_B^2}{R} \searrow \beta\right] \\
&= (a_B)_t (\cos\beta\mathbf{i} + \sin\beta\mathbf{j}) + \frac{v_B^2}{R}(-\sin\beta\mathbf{i} + \cos\beta\mathbf{j}) \\
&= (a_B)_t \cos\beta\mathbf{i} + (a_B)_t \sin\beta\mathbf{j} - \frac{(0.29873)^2}{0.3}(-\sin\beta\mathbf{i} + \cos\beta\mathbf{j}) \\
&= (a_B)_t \cos\beta\mathbf{i} + (a_B)_t \sin\beta\mathbf{j} - 0.17174\mathbf{i} + 0.24288\mathbf{j}
\end{aligned}$$

Equate the two expression for $\mathbf{a}_B$ and resolve into components.

i: $(a_B)_t \cos\beta - 0.17174 = (0.2\cos 60°)\alpha_{AB} - 1.03046$ (3)

j: $(a_B)_t \sin\beta + 0.24288 = 0.2\sin 60°\alpha_{AB} + 0.44494$ (4)

Solving Eqs. (3) and (4) simultaneously,

$$(a_B)_t = -2.0187 \text{ m/s}^2 \qquad \alpha_{AB} = -7.8956 \text{ rad/s}^2$$

PROBLEM 15.255

Water flows through a curved pipe *AB* that rotates with a constant clockwise angular velocity of 90 rpm. If the velocity of the water relative to the pipe is 8 m/s, determine the total acceleration of a particle of water at Point *P*.

SOLUTION

Let the curved pipe be a rotating frame of reference. Its angular velocity is $90 \text{ rpm} \circlearrowright$ or $\boldsymbol{\omega} = 9.4248 \text{ rad/s} \circlearrowright$.

Motion of the frame of reference at Point P′.

$$\mathbf{v}_{P'} = (AP)\omega \measuredangle\!\nearrow 45° = (0.5\sqrt{2})(9.4248) \measuredangle\!\nearrow 45° = 6.6643 \text{ m/s} \measuredangle\!\nearrow 45°$$

$$\mathbf{a}_{P'} = (AP)\omega^2 \searrow 45° = (0.5\sqrt{2})(9.4248)^2 \searrow 45° = 62.81 \text{ m/s}^2 \searrow 45°$$

Motion of water relative to the frame at Point P.

$$\mathbf{v}_{P/F} = 8 \text{ m/s} \leftarrow$$

$$\mathbf{a}_{P/F} = \frac{(v_{P/F})^2}{\rho} \downarrow = \frac{(8 \text{ m/s})^2}{0.5 \text{ m}} \downarrow = 128 \text{ m/s}^2 \downarrow$$

Coriolis acceleration.

$$a_c = 2\omega v_{P/F} = (2)(9.4248)(8) = 150.797 \text{ m/s}^2$$

$$\mathbf{a}_c = 150.797 \text{ m/s}^2 \uparrow$$

Acceleration of water at Point P.

$$\mathbf{a}_P = \mathbf{a}_{P'} + \mathbf{a}_{P/F} + \mathbf{a}_c$$

$$\mathbf{a}_P = [62.81 \searrow 45°] + [128 \downarrow] + [150.797 \uparrow]$$

$$= [44.413 \text{ m/s}^2 \rightarrow] + [21.616 \text{ m/s}^2 \downarrow]$$

$$\mathbf{a}_P = 49.4 \text{ m/s}^2 \searrow 26.0° \blacktriangleleft$$

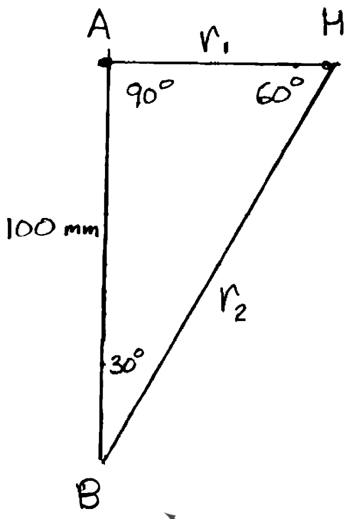
PROBLEM 15.257

Two rods *AE* and *BD* pass through holes drilled into a hexagonal block. (The holes are drilled in different planes so that the rods will not touch each other.) Knowing that rod *AE* has an angular velocity of 20 rad/s clockwise and an angular acceleration of 4 rad/s^2 counterclockwise when $\theta = 90°$, determine, (*a*) the relative velocity of the block with respect to each rod, (*b*) the relative acceleration of the block with respect to each rod.

SOLUTION

Geometry: When $\theta = 90°$, Point *H* is located as shown in the sketch. Apply the law of sines to the triangle *ABH*.



$$\frac{100 \text{ mm}}{\sin 60°} = \frac{r_1}{\sin 30°} = \frac{r_2}{\sin 90°}$$

$$r_1 = 57.735 \text{ mm}$$

$$r_2 = 115.470 \text{ mm}$$

The angle at *H* remains at 60° so that rods *AE* and *BD* have a common angular velocity $\boldsymbol{\omega} = \omega \circlearrowleft$ and a common angular acceleration $\boldsymbol{\alpha} = \alpha \circlearrowleft$, where

$$\omega = -20 \text{ rad/s}$$

and

$$\alpha = 4 \text{ rad/s}$$

Consider the double slider *H* as a particle sliding along the rotating rod *AH* with relative velocity $u_1 \longrightarrow$ and relative acceleration $\dot{u}_1 \longrightarrow$.

Let H' be the point on rod *AE* that coincides with *H*.

$$\mathbf{v}_{H'} = [r_1\omega \uparrow] = [(57.735 \text{ mm})(-20 \text{ rad/s}) \uparrow] = [1154.7 \text{ mm/s} \downarrow]$$

$$\mathbf{a}_{H'} = [r_1\alpha \uparrow] + [r_1\omega^2 \longleftarrow]$$

$$= [(57.735 \text{ mm})(4 \text{ rad/s}^2) \uparrow] + [(57.735 \text{ mm})(20 \text{ rad/s})^2 \longleftarrow]$$

$$= [230.9 \text{ mm/s}^2 \uparrow] + [23094 \text{ mm/s}^2 \longleftarrow]$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

The corresponding Coriolis acceleration is

$$\mathbf{a}_1 = [2\omega u_1 \uparrow] = [(2)(-20)u_1 \uparrow] = 40u_1 \downarrow$$

$$\mathbf{v}_H = \mathbf{v}_{H'} + u_1 \longrightarrow = [1154.7 \text{ mm} \downarrow] + [u_1 \longrightarrow] \qquad (1)$$

$$\mathbf{a}_H = a_{H'} + [\dot{u}_1 \longrightarrow] + [40u_1 \downarrow]$$

$$= [230.9 \text{ mm/s} \uparrow] + [23094 \text{ mm/s}^2 \longleftarrow] + [\dot{u}_1 \longrightarrow] + [40u_1 \downarrow] \qquad (2)$$

Now consider the double slider H as a particle sliding along the rotating rod BD with relative velocity $u_2 \measuredangle 60°$ and relative acceleration $\dot{u}_2 \measuredangle 60°$.

Let H'' be the point on rod BD that coincides with H.

$$\mathbf{v}_{H''} = r_2\omega \searrow 30° = (115.47 \text{ mm})(-20 \text{ rad/s}) \searrow 30° = 2309.4 \text{ mm/s} \nwarrow 30°$$

$$\mathbf{a}_{H''} = r_2\alpha \searrow 30° + r_2\omega^2 \swarrow 60°$$

$$= (115.47 \text{ mm})(4 \text{ rad/s}^2) \searrow 30° + (115.47 \text{ mm})(20 \text{ rad/s})^2 \swarrow 60°$$

$$= 461.9 \text{ mm/s}^2 \searrow 30° + 46188 \text{ mm/s}^2 \swarrow 60°$$

The corresponding Coriolis acceleration is

$$\mathbf{a}_2 = 2\omega u_2 \searrow 30° = (2)(-20 \text{ rad/s})u_2 \searrow 60° = 40u_2 \nwarrow 30°$$

$$\mathbf{v}_H = \mathbf{v}_{H''} + u_2 \measuredangle 60° = 2309.4 \text{ mm/s} \nwarrow 30° + u_2 \measuredangle 60° \qquad (3)$$

$$\mathbf{a}_H = \mathbf{a}_{H''} + \dot{u}_2 \measuredangle 60° + 40u_2 \nwarrow 30°$$

$$= [(461.9 \text{ mm/s}^2) \searrow 30°] + [(46188 \text{ mm/s}^2) \swarrow 60°] + [\dot{u}_2 \measuredangle 60°] + [40u_2 \nwarrow 30°] \qquad (4)$$

Equate expression (1) and (3) for $\mathbf{v}_H$ and resolve into components.

$+\uparrow$: $\quad 1154.7 \text{ mm/s} = -(2309.4 \text{ mm/s})\sin 30° + u_2 \sin 60°$

$$u_2 = \frac{2309.4 \sin 30° - 1154.7}{\sin 60°} \qquad u_2 = 0$$

$\xrightarrow{+}$: $\quad u_1 = 2309.4 \cos 30° + 0 \qquad u_1 = 2000 \text{ mm/s}$

Substitute the values for u_1 and u_2 into the Coriolis acceleration terms, and equate expressions (2) and (4) for $\mathbf{a}_H$, and resolve into components.

$+\uparrow$: $\quad 230.9 \text{ mm/s}^2 - (40 \text{ rad/s})(2000 \text{ mm/s})$

$$= (461.9 \text{ mm/s}^2)\sin 30° + (46188 \text{ mm/s}^2)\sin 60° + \dot{u}_2 \sin 60° - (40)(0)\sin 30°$$

$$\dot{u}_2 = \frac{230.9 - 80000 - 230.9 + 40000}{\sin 60°} \qquad \dot{u}_2 = -46188 \text{ mm/s}^2$$

PROBLEM 15.258

Rod BC of length 24 in. is connected by ball-and-socket joints to a rotating arm AB and to a collar C that slides on the fixed rod DE. Knowing that the length of arm AB is 4 in. and that it rotates at the constant rate $\omega_1 = 10$ rad/s, determine the velocity of collar C when $\theta = 0$.

SOLUTION

Geometry.

$$l_{BC} = 24 \text{ in.}$$
$$\mathbf{r}_{C/B} = (8 \text{ in.})\mathbf{i} - (16 \text{ in.})\mathbf{j} + z_{C/B}\mathbf{k}$$
$$24^2 = 8^2 + 16^2 + z_{C/B}^2$$
$$z_{C/B} = 16 \text{ in.}$$
$$\mathbf{r}_{C/B} = (8 \text{ in.})\mathbf{i} - (16 \text{ in.})\mathbf{j} + (16 \text{ in.})\mathbf{k}$$
$$\mathbf{r}_{B/A} = -(4 \text{ in.})\mathbf{i}$$

Velocity at B.

$$\mathbf{v}_B = \omega_1\mathbf{k} \times \mathbf{r}_{B/A}$$
$$= 10\mathbf{k} \times (-4\mathbf{i})$$
$$= -(40 \text{ in./s})\mathbf{j}$$

Velocity of collar C.

$$\mathbf{v}_C = v_C\mathbf{k}$$
$$\mathbf{v}_C = \mathbf{v}_B + \mathbf{v}_{C/B}$$

where

$$\mathbf{v}_{C/B} = \boldsymbol{\omega}_{BC} \times \mathbf{r}_{B/C}$$

Noting that $\mathbf{v}_{C/B}$ is perpendicular to $\mathbf{r}_{C/B}$, we get $\mathbf{r}_{C/B} \cdot \mathbf{v}_{C/B} = 0$

Forming $\mathbf{r}_{C/B} \cdot \mathbf{v}_C$, we get

$$\mathbf{r}_{C/B} \cdot \mathbf{v}_C = \mathbf{r}_{C/B} \cdot (\mathbf{v}_B + \mathbf{v}_{C/B})$$
$$= \mathbf{r}_{C/B} \cdot \mathbf{v}_B + \mathbf{r}_{C/B} \cdot \mathbf{v}_{C/B}$$

or

$$\mathbf{r}_{C/B} \cdot \mathbf{v}_C = \mathbf{r}_{C/B}\mathbf{v}_B \quad (1)$$

From Eq. (1)

$$(8\mathbf{i} - 16\mathbf{j} + 16\mathbf{k}) \cdot (v_C\mathbf{k}) = (8\mathbf{i} - 16\mathbf{j} + 16\mathbf{k}) \cdot (-40\mathbf{j})$$
$$16v_C = (-16)(-40)$$

or

$$v_C = 40 \text{ in./s}$$

$\mathbf{v}_C = (40.0 \text{ in./s})\mathbf{k}$ ◀

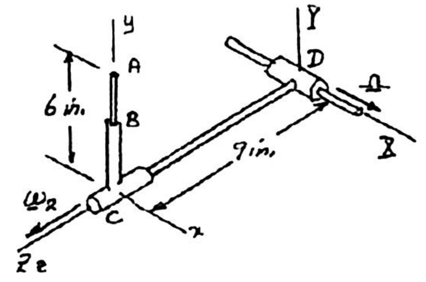
PROBLEM 15.259

In the position shown, the thin rod moves at a constant speed $u = 3$ in./s out of the tube BC. At the same time, tube BC rotates at the constant rate $\omega_2 = 1.5$ rad/s with respect to arm CD. Knowing that the entire assembly rotates about the X axis at the constant rate $\omega_1 = 1.2$ rad/s, determine the velocity and acceleration of end A of the rod.

SOLUTION

Geometry. $\mathbf{r}_A = (6 \text{ in.})\mathbf{j} + (9 \text{ in.})\mathbf{k}$

Method 1



Let the rigid body DCB be a rotating frame of reference.

Its angular velocity is
$$\mathbf{\Omega} = \omega_1\mathbf{i} + \omega_2\mathbf{k}$$
$$= (1.2 \text{ rad/s})\mathbf{i} - (1.5 \text{ rad/s})\mathbf{k}.$$

Its angular acceleration is
$$\boldsymbol{\alpha} = \omega_1\mathbf{i} \times \omega_2\mathbf{k}$$
$$= -\omega_1\omega_2\mathbf{j}$$
$$= (1.8 \text{ rad/s}^2)\mathbf{j}.$$

Motion of the coinciding Point A′ in the frame.

$$\mathbf{v}_{A'} = \mathbf{\Omega} \times \mathbf{r}_A$$
$$= (1.2\mathbf{i} - 1.5\mathbf{k}) \times (6\mathbf{j} + 9\mathbf{k})$$
$$= 7.2\mathbf{k} - 10.8\mathbf{j} + 9\mathbf{i}$$
$$= (9 \text{ in./s})\mathbf{i} - (10.8 \text{ in./s})\mathbf{j} + (7.2 \text{ in./s})\mathbf{k}$$

$$\mathbf{a}_{A'} = \boldsymbol{\alpha} \times \mathbf{r}_A + \mathbf{\Omega} \times \mathbf{v}_{A'}$$
$$= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 0 & 1.8 & 0 \\ 0 & 6 & 9 \end{vmatrix} + \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1.2 & 0 & -1.5 \\ 9 & -10.8 & 7.2 \end{vmatrix}$$
$$= 16.2\mathbf{i} - 16.2\mathbf{i} - 22.14\mathbf{j} - 12.96\mathbf{k}$$
$$= -(22.14 \text{ in./s}^2)\mathbf{j} - (12.96 \text{ in./s}^2)\mathbf{k}$$

Motion of Point A relative to the frame.

$$\mathbf{v}_{A/F} = u\mathbf{j} = (3 \text{ in./s})\mathbf{j},$$
$$\mathbf{a}_{A/F} = 0$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

Velocity of Point A.

$$\mathbf{v}_A = \mathbf{v}_{A'} + \mathbf{v}_{A/F}$$
$$\mathbf{v}_A = 9\mathbf{i} - 10.8\mathbf{j} + 7.2\mathbf{k} + 3\mathbf{j}$$

$$\mathbf{v}_A = (9.00 \text{ in./s})\mathbf{i} - (7.80 \text{ in./s})\mathbf{j} + (7.20 \text{ in./s})\mathbf{k} \blacktriangleleft$$

Coriolis acceleration.

$$2\boldsymbol{\Omega} \times \mathbf{v}_{A/F} = (2)(1.2\mathbf{i} - 1.5\mathbf{k}) \times 3\mathbf{j}$$
$$= (9 \text{ in./s}^2)\mathbf{i} + (7.2 \text{ in./s}^2)\mathbf{k}$$

Acceleration of Point A.

$$\mathbf{a}_A = \mathbf{a}_{A'} + \mathbf{a}_{A/F} + 2\boldsymbol{\Omega} \times \mathbf{v}_{A/F}$$
$$\mathbf{a}_A = -22.14\mathbf{j} - 12.92\mathbf{k} + 9\mathbf{i} + 7.2\mathbf{k}$$

$$\mathbf{a}_A = (9.00 \text{ in./s}^2)\mathbf{i} - (22.1 \text{ in./s}^2)\mathbf{j} - (5.76 \text{ in./s}^2)\mathbf{k} \blacktriangleleft$$

Method 2

Let frame *Dxyz*, which at instant shown coincides with *DXYZ*, rotate with an angular velocity $\boldsymbol{\Omega} = \omega_1\mathbf{i} = 1.2\mathbf{i}$ rad/s. Then the motion relative to the frame consists of the rotation of body *DCB* about the *Z* axis with angular velocity $\omega_2\mathbf{k} = -(1.5 \text{ rad/s})\mathbf{k}$ plus the sliding motion $\mathbf{u} = u\mathbf{i} = (3 \text{ in./s})\mathbf{j}$ of the rod *AB* relative to the body *DCB*.

Motion of the coinciding Point A′ in the frame.

$$\mathbf{v}_{A'} = \boldsymbol{\Omega} \times \mathbf{r}_A$$
$$= 1.2\mathbf{i} \times (6\mathbf{j} + 9\mathbf{k})$$
$$= -(10.8 \text{ in./s})\mathbf{j} + (7.2 \text{ in./s})\mathbf{k}$$
$$\mathbf{a}_{A'} = \boldsymbol{\Omega} \times \mathbf{v}_{A'}$$
$$= 1.2\mathbf{i} \times (-10.8\mathbf{j} + 7.2\mathbf{k})$$
$$= -(8.64 \text{ in./s}^2)\mathbf{j} - (12.96 \text{ in./s}^2)\mathbf{k}$$

Motion of Point A relative to the frame.

$$\mathbf{v}_{A/F} = \omega_2\mathbf{k} \times \mathbf{r}_A + u\mathbf{j}$$
$$= (-1.5\mathbf{k}) \times (6\mathbf{j} + 9\mathbf{k}) + 3\mathbf{j}$$
$$= (9 \text{ in./s})\mathbf{i} + (3 \text{ in./s})\mathbf{j}$$
$$\mathbf{a}_{A/F} = \alpha_2\mathbf{k} \times \mathbf{r}_A + \omega_2\mathbf{k} \times (\omega_2\mathbf{k} \times \mathbf{r}_A) + \dot{u}\mathbf{j} + 2\omega_2\mathbf{k} \times (u\mathbf{j})$$
$$= 0 + (-1.5\mathbf{k}) \times (9\mathbf{i}) + 0 + (2)(-1.5\mathbf{k}) \times (3\mathbf{j})$$
$$= -13.5\mathbf{j} + 9\mathbf{i}$$
$$= (9 \text{ in./s}^2)\mathbf{i} - (13.5 \text{ in./s}^2)\mathbf{j}$$

Velocity of Point A.

$$\mathbf{v}_A = \mathbf{v}_{A'} + \mathbf{v}_{A/F}$$
$$\mathbf{v}_A = -10.8\mathbf{j} + 7.2\mathbf{k} + 9\mathbf{i} + 3\mathbf{j}$$

$$\mathbf{v}_A = (9.00 \text{ in./s})\mathbf{i} - (7.80 \text{ in./s})\mathbf{j} + (7.20 \text{ in./s})\mathbf{k} \blacktriangleleft$$

If you are a student using this Manual, you are using it without permission.*

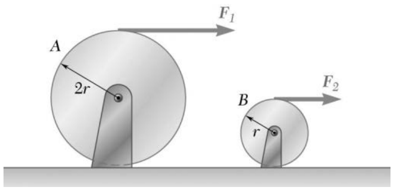
PROBLEM 16.CQ3



Two solid cylinders, A and B, have the same mass m and the radii $2r$ and r respectively. Each is accelerated from rest with a force applied as shown. In order to impart identical angular accelerations to both cylinders, what is the relationship between F_1 and F_2?

(*a*) $F_1 = 0.5F_2$

(*b*) $F_1 = F_2$

(*c*) $F_1 = 2F_2$

(*d*) $F_1 = 4F_2$

(*e*) $F_1 = 8F_2$

SOLUTION

Answer: (*c*)

$$Fr = I\alpha$$

$$\alpha = \frac{FR}{\frac{1}{2}mR^2} = \frac{F_1(2r)}{\frac{1}{2}m(2r)^2} = \frac{F_2 r}{\frac{1}{2}mr^2}$$

$$\frac{F_1}{mr} = \frac{2F_2}{mr}$$

$\mathbf{F}_1 = 2F_2$ ◀

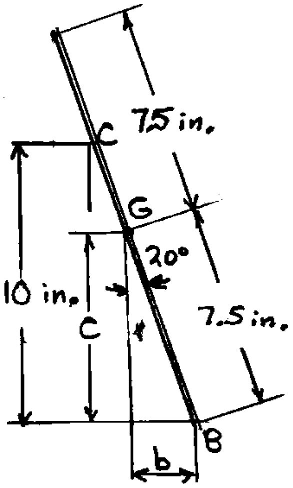
PROBLEM 16.1

A conveyor system is fitted with vertical panels, and a 15-in. rod AB weighing 5 lb is lodged between two panels as shown. If the rod is to remain in the position shown, determine the maximum allowable acceleration of the system.

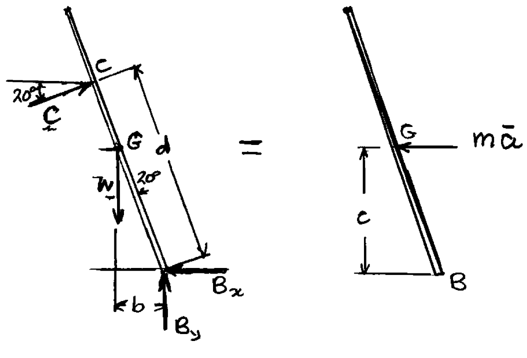
SOLUTION



Geometry:
$$d = \frac{10 \text{ in.}}{\cos 20°} = 10.642 \text{ in.}$$
$$b = \frac{1}{2}(15 \text{ in.})\sin 20° = 2.5652 \text{ in.}$$
$$c = \frac{1}{2}(15 \text{ in.})\cos 20° = 7.0477 \text{ in.}$$

Mass:
$$m = \frac{W}{g} = \frac{5 \text{ lb}}{32.2 \text{ ft/s}^2} = 0.15528 \text{ slug}$$

Kinetics:



$$+\circlearrowright \Sigma M_B = \Sigma (M_B)_{\text{eff}}: \quad Cd - Wb = -m\bar{a}c$$

Maximum allowable acceleration.

This occurs at loss of contact when $C = 0$.

$$ma = \frac{Wb}{c} = \frac{(5 \text{ lb})(2.5652 \text{ in.})}{7.0477 \text{ in.}} = 1.8199 \text{ lb}$$

$$a = \frac{ma}{m} = \frac{1.8199 \text{ lb}}{0.15528 \text{ slug}}$$

$a = 11.72$ ft/s ◀

If you are a student using this Manual, you are using it without permission.*

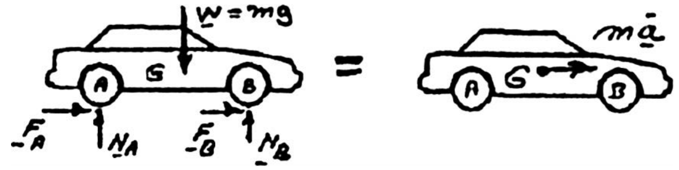
PROBLEM 16.3

Knowing that the coefficient of static friction between the tires and the road is 0.80 for the automobile shown, determine the maximum possible acceleration on a level road, assuming (*a*) four-wheel drive, (*b*) rear-wheel drive, (*c*) front-wheel drive.

SOLUTION

(*a*) Four-wheel drive:



$$+\uparrow \Sigma F_y = 0: \quad N_A + N_B - W = 0 \qquad N_A + N_B = W = mg$$

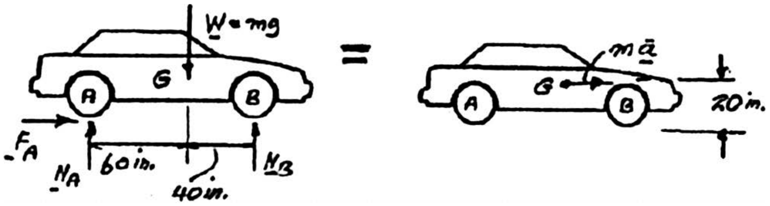
Thus: $$F_A + F_B = \mu_k N_A + \mu_k N_B = \mu_k (N_A + N_B) = \mu_k W = 0.80mg$$

$$\xrightarrow{+} \Sigma F_x = \Sigma (F_x)_{\text{eff}}: \quad F_A + F_B = m\bar{a}$$

$$0.80mg = m\bar{a}$$

$$\bar{a} = 0.80g = 0.80(32.2 \text{ ft/s}^2) \qquad \bar{\mathbf{a}} = 25.8 \text{ ft/s}^2 \longrightarrow \blacktriangleleft$$

(*b*) Rear-wheel drive:



$$+\circlearrowleft \Sigma M_B = \Sigma (M_B)_{\text{eff}}: \quad (40 \text{ in.})W - (100 \text{ in.})N_A = -(20 \text{ in.})m\bar{a}$$

$$N_A = 0.4W + 0.2m\bar{a}$$

Thus: $$F_A = \mu_k N_B = 0.80(0.4W + 0.2m\bar{a}) = 0.32mg + 0.16m\bar{a}$$

$$\xrightarrow{+} \Sigma F_x = \Sigma (F_x)_{\text{eff}}: \quad F_A = m\bar{a}$$

$$0.32mg + 0.16m\bar{a} = m\bar{a}$$

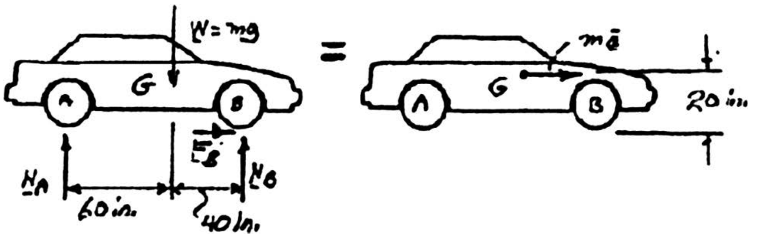
$$0.32g = 0.84\bar{a}$$

$$\bar{a} = \frac{0.32}{0.84}(32.2 \text{ ft/s}^2) \qquad \bar{\mathbf{a}} = 12.27 \text{ ft/s}^2 \longrightarrow \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 16.3 (Continued)

(*c*) Front-wheel drive:



$$+\circlearrowleft \Sigma M_A = \Sigma(M_A)_{\text{eff}}: \quad (100 \text{ in.})N_B - (60 \text{ in.})W = -(20 \text{ in.})m\bar{a}$$

$$N_B = 0.6W - 0.2m\bar{a}$$

Thus: $$F_B = \mu_k N_B = 0.80(0.6W - 0.2m\bar{a}) = 0.48mg - 0.16m\bar{a}$$

$$\xrightarrow{+} \Sigma F_x = \Sigma(F_x)_{\text{eff}}: \quad F_B = m\bar{a}$$

$$0.48mg - 0.16m\bar{a} = m\bar{a}$$

$$0.48g = 1.16\bar{a}$$

$$\bar{a} = \frac{0.48}{1.16}(32.2 \text{ ft/s}^2)$$

$$\bar{\mathbf{a}} = 13.32 \text{ ft/s}^2 \longrightarrow \blacktriangleleft$$

PROBLEM 16.6

A 2000-kg truck is being used to lift a 400-kg boulder B that is on a 50-kg pallet A. Knowing the acceleration of the rear-wheel drive truck is 1 m/s^2, determine (a) the reaction at each of the front wheels, (b) the force between the boulder and the pallet.

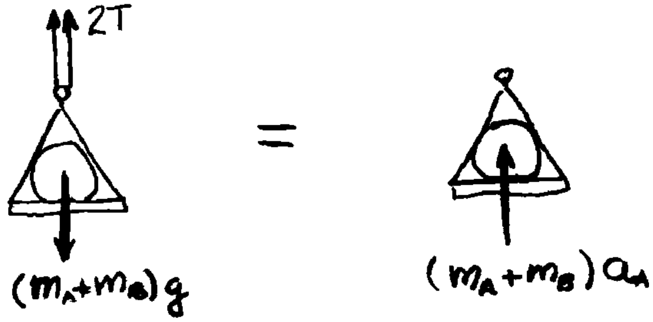
SOLUTION

Kinematics: Acceleration of truck: $\mathbf{a}_T = 1\text{ m/s}^2 \longleftarrow$.

When the truck moves 1 m to the left, the boulder B and pallet A are raised 0.5 m.

Then, $\mathbf{a}_A = 0.5\text{ m/s}^2 \uparrow$ $\quad\quad$ $\mathbf{a}_B = 0.5\text{ m/s}^2 \uparrow$

<u>Kinetics</u>: Let T be the tension in the cable.



Pallet and boulder: $+\!\uparrow \Sigma F_y = \Sigma (F_y)_{\text{eff}}: \quad 2T - (m_A + m_B)_g = (m_A + m_B)a_B$

$$2T - (450\text{ kg})(9.81\text{ m/s}^2) = (450\text{ kg})(0.5\text{ m/s}^2)$$

$$T = 2320\text{ N}$$

PROBLEM 16.11

A completely filled barrel and its contents have a combined mass of 90 kg. A cylinder C is connected to the barrel at a height h = 550 mm as shown. Knowing $\mu_s = 0.40$ and $\mu_k = 0.35$, determine the maximum mass of C so the barrel will not tip.

SOLUTION

Kinematics: Assume that the barrel is sliding, but not tipping.

$$\alpha = 0 \qquad \mathbf{a}_G = a \longrightarrow$$

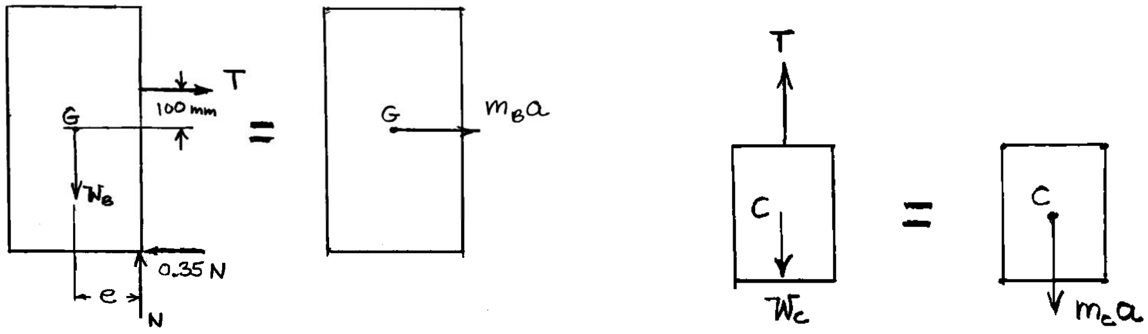
Since the cord is inextensible, $\mathbf{a}_C = a \downarrow$

Kinetics: Draw the free body diagrams of the barrel and the cylinder. Let T be the tension in the cord.

The barrel is sliding. $F_F = \mu_k N = 0.35\,N$

Assume that tipping is impending, so that the line of action of the reaction on the bottom of the barrel passes through Point B.

$$e = 250 \text{ mm}$$



For the barrel. $+\uparrow \Sigma F_y = 0: \quad N - W_B = 0 \qquad N = W_B = m_B g = 882.90 \text{ N}$

$$+\circlearrowleft \Sigma M_G = 0: \quad Ne - 100T - (450)(0.35\,N) = 0$$

$$T = \frac{e - (450)(0.35)}{100} N = \frac{250 - 157.5}{100}(882.90) = 816.68 \text{ N}$$

$$\xrightarrow{+} \Sigma F_x = m_B a: \quad T - 0.35\,N = m_B a$$

$$a = \frac{816.68}{90} - 0.35\frac{882.90}{90} = 5.6407 \text{ m/s}^2$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 16.12

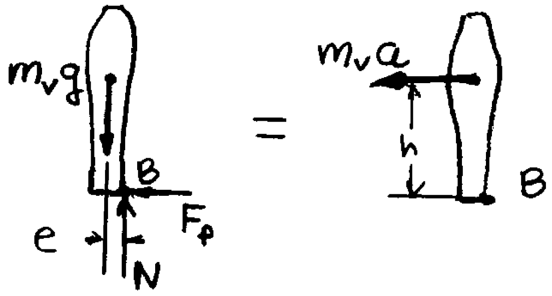
A 40-kg vase has a 200-mm-diameter base and is being moved using a 100-kg utility cart as shown. The cart moves freely ($\mu = 0$) on the ground. Knowing the coefficient of static friction between the vase and the cart is $\mu_s = 0.4$, determine the maximum force **F** that can be applied if the vase is not to slide or tip.

SOLUTION

Vase:



$$+\uparrow \Sigma F_y = \Sigma (F_y)_{\text{eff}}: \quad N - m_V g = 0$$

$$N = m_V g = (40 \text{ kg})(9.81 \text{ m/s}^2) = 392.4 \text{ N}$$

For impending sliding, $\quad F_f = \mu_S N$

$$F_f = (0.4)(392.4 \text{ N}) = 156.96 \text{ N}$$

$$\overset{+}{\leftarrow} \Sigma F_x = \Sigma (F_x)_{\text{eff}}: \quad F_f = m_V a$$

$$a = \frac{F_f}{m_V} = \frac{156.96 \text{ N}}{40} = 3.924 \text{ m/s}^2$$

This is the limiting value of a for sliding.

$$+\circlearrowleft M_B = \Sigma (M_B)_{\text{eff}}: \quad m_V g e = m_V a h$$

$$a = \frac{e}{h} g = \frac{100 \text{ mm}}{600 \text{ mm}} (9.81 \text{ m/s}^2) = 1.635 \text{ m/s}^2$$

This is the limiting value of a for tipping.

The smaller value governs. $\quad a = 1.635 \text{ m/s}^2$

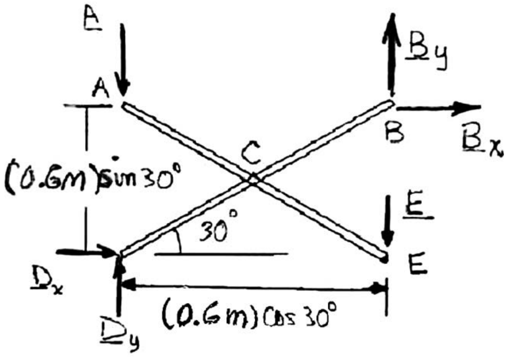
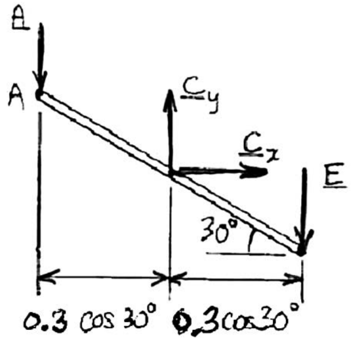
PROBLEM 16.17

Members *ACE* and *DCB* are each 600 mm long and are connected by a pin at *C*. The mass center of the 10-kg member *AB* is located at *G*. Determine (*a*) the acceleration of *AB* immediately after the system has been released from rest in the position shown, (*b*) the corresponding force exerted by roller *A* on member *AB*. Neglect the weight of members *ACE* and *DCB*.

SOLUTION





Analysis of linkage

Since members *ACE* and *DCB* are of negligible mass, their effective forces may also be neglected and the methods of statics may be applied to their analysis.

Free body: *Entire linkage*:

$$+\circlearrowleft \Sigma M_D = 0:$$

$$(B_y - E)(0.6\cos 30°) - B_x(0.6\sin 30°) = 0$$

$$(B_y - E)\cos 30° - B_x \sin 30° = 0 \quad (1)$$

Free body: *member ACE*

$$+\circlearrowleft \Sigma M_C = 0:$$

$$A(0.3\cos 30°) - E(0.3\cos 30°) = 0; \quad E = A$$

Carrying into Eq. (1):

$$(B_y - A)\cos 30° - B_x \sin 30° = 0 \quad (2)$$

Equations of Motion for Member AB

PROBLEM 16.17 (Continued)

(*a*) $+\searrow 60^\circ \quad \Sigma F_t - \Sigma(F_t)_{\text{eff}}:$

$$(B_y - A)\cos 30^\circ - B_x \sin 30^\circ + W\cos 30^\circ = m\bar{a}$$

Recalling equation (2), we have,

$$W\cos 30^\circ = m\bar{a} \qquad \bar{a} = \frac{W}{m}\cos 30^\circ = g\cos 30^\circ$$

$$\bar{a} = (9.81 \text{ m/s}^2)\cos 30^\circ$$

$\bar{\mathbf{a}} = 8.50 \text{ m/s}^2 \searrow 60^\circ$ ◀

(*b*) $+\circlearrowleft \Sigma M_B = \Sigma(M_B)_{\text{eff}}:$

$$W(0.15 \text{ m}) - A(0.6 \text{ m})\cos 30^\circ = (m\bar{a}\sin 60^\circ)(0.15 \text{ m}) - (m\bar{a}\cos 60^\circ)(0.05 \text{ m})$$

But, $\quad m\bar{a} = W\cos 30^\circ$

$$0.15\,W - 0.6\,A\cos 30^\circ = W\cos 30^\circ(0.15\sin 60^\circ - 0.05\cos 60^\circ)$$

$$A = W\left(\frac{1}{4\cos 30^\circ} - \frac{1}{4}\sin 60^\circ + \frac{1}{12}\cos 60^\circ\right) = 0.11384\,W = 0.11384\,mg$$

Recalling that $m = 10$ kg so that $mg = 98.1$ N,

$$A = 0.11384(98.1) = 11.168 \text{ N}$$

$\mathbf{A} = 11.17 \text{ N}\uparrow$ ◀

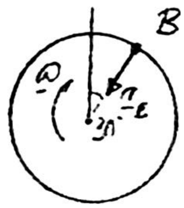
PROBLEM 16.18

The 15-lb rod *BC* connects a disk centered at *A* to crank *CD*. Knowing that the disk is made to rotate at the constant speed of 180 rpm, determine for the position shown the vertical components of the forces exerted on rod *BC* by the pins at *B* and *C*.

SOLUTION

We first determine the acceleration of Point *B* of disk.



$$\omega = 180 \text{ rpm} = 18.85 \text{ rad/s}$$

Since $\omega = \text{constant}$

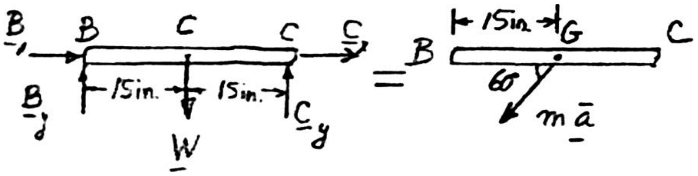
$$a_B = (a_B)_n = r\omega^2$$

$$= \left(\frac{8}{12}\text{ ft}\right)(18.85 \text{ rad/s})^2$$

$$\mathbf{a}_B = 236.9 \text{ ft/s}^2 \nearrow 60°$$

Since rod *BC* is in translation.

$$\bar{\mathbf{a}} = \bar{\mathbf{a}}_B = 236.9 \text{ ft/s}^2 \nearrow 60°$$



Vertical components of forces at *B* and *C*.

$$+\circlearrowleft \Sigma M_B = \Sigma(M_B)_{\text{eff}}: \quad C_y(30 \text{ in.}) - W(15 \text{ in.}) = -m\bar{a}\sin 60°(15 \text{ in.})$$

Since $W = 15 \text{ lb}$ and $m\bar{a} = \dfrac{15 \text{ lb}}{32.2}(236.9) = 110.36 \text{ lb}$

$$30C_y - (15)(15) = -110.36\sin 60°(15) = -95.57(15)$$

$$2C_y = -95.57 + 15 = -80.57, \quad C_y = -40.285 \text{ lb} \qquad \mathbf{C}_y = 40.3 \text{ lb} \downarrow \blacktriangleleft$$

$$+\uparrow \Sigma F_y = \Sigma(F_y)_{\text{eff}}: \qquad B_y - W + C_y = -m\bar{a}\sin 60°$$

$$B_y = W - C_y - \frac{15}{32.2}(236.9)\sin 60° = 15 + 40.285 - 95.57$$

$$B_y = -40.285 \text{ lb} \qquad \mathbf{B}_y = 40.3 \text{ lb} \downarrow \blacktriangleleft$$

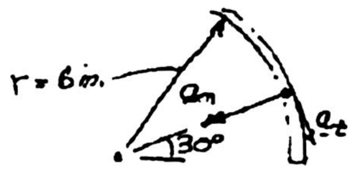
PROBLEM 16.19

The triangular weldment ABC is guided by two pins that slide freely in parallel curved slots of radius 6 in. cut in a vertical plate. The weldment weighs 16 lb and its mass center is located at Point G. Knowing that at the instant shown the velocity of each pin is 30 in./s downward along the slots, determine (a) the acceleration of the weldment, (b) the reactions at A and B.

SOLUTION



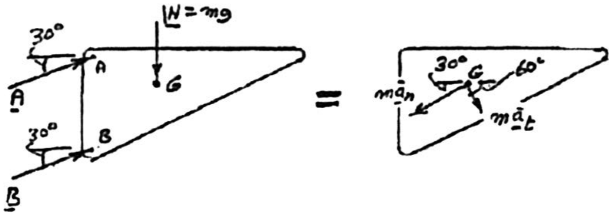
Slot: $v = 30\text{ in./s}$ ↘

$$a_n = \frac{v^2}{r} = \frac{(30\text{ in./s})^2}{6\text{ in.}} = 150\text{ in./s}^2$$

$$\mathbf{a}_n = 12.5\text{ ft/s}^2 \;\swarrow\; 30°$$

$$\mathbf{a}_t = a_t \;\nwarrow\!\searrow\; 60°$$

Weldment is in translation $\quad \bar{\mathbf{a}}_n = 12.5\text{ ft/s}^2$



$\nwarrow\!\searrow 60°\; \Sigma F = \Sigma F_{\text{eff}}: \quad mg\cos 30° = ma_t$

$$\bar{\mathbf{a}}_t = 27.886\text{ ft/s}^2 \;\nwarrow\!\searrow\; 60°$$

(a) Acceleration

$$\beta = \tan^{-1}\frac{\bar{a}_n}{\bar{a}_t} = \tan^{-1}\frac{12.5}{27.886} = 24.14°$$

$$\bar{a}^2 = a_t^2 + a_n^2$$
$$= (27.886)^2 + (12.5)^2$$

$$\bar{\mathbf{a}} = 30.56\text{ ft/s}^2 \;\nwarrow\!\searrow\; 84.1° \qquad \bar{\mathbf{a}} = 30.6\text{ ft/s}^2 \;\nwarrow\!\searrow\; 84.1° \blacktriangleleft$$

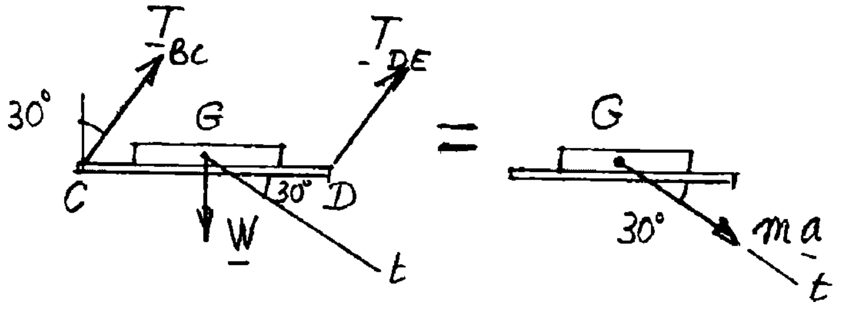
PROBLEM 16.20

The coefficients of friction between the 30-lb block and the 5-lb platform *BD* are $\mu_s = 0.50$ and $\mu_k = 0.40$. Determine the accelerations of the block and of the platform immediately after wire *AB* has been cut.

SOLUTION

Assume that the block does not slide relative to the platform. Draw the free body diagram of the platform and block.

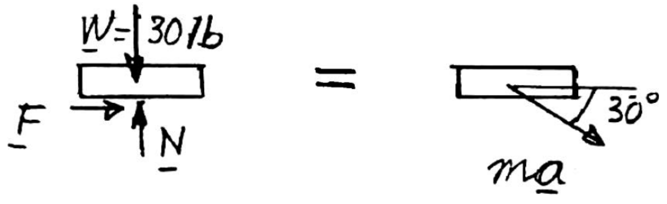


$$+\searrow \Sigma F_t = \Sigma(F_t)_{\text{eff}}: \quad W \sin 30° = ma$$

$$a = \frac{W}{m}\sin 30° = \frac{1}{2}g = 16.1 \text{ ft/s}^2$$

$$a = 16.1 \text{ ft/s}^2 \searrow 30°$$

Check whether or not the block will slide relative to the platform. Draw the free body diagram of the block alone.



$$ma = m\left(\frac{1}{2}g\right) = \frac{1}{2}W = 15 \text{ lb}$$

$$\xrightarrow{+} \Sigma F_x = \Sigma(F_x)_{\text{eff}}: \quad F = (15 \text{ lb}) \cos 30° = 12.99 \text{ lb}$$

$$+\downarrow \Sigma F_y = \Sigma(F_y)_{\text{eff}}: \quad 30 \text{ lb} - N = (15 \text{ lb}) \sin 30°$$

$$N = 30 - 7.5 = 22.5 \text{ lb}$$

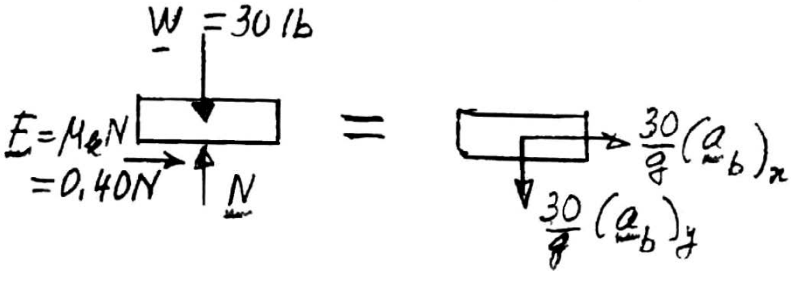
PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

Thus, $F_m = \mu_s N = 0.50\ (22.5\text{ lb}) = 11.25\text{ lb}$

Since $F > F_m$, <u>the block will slide</u>

Now assume that the block slides relative to the platform.

Equations of motion for block: (assuming sliding)



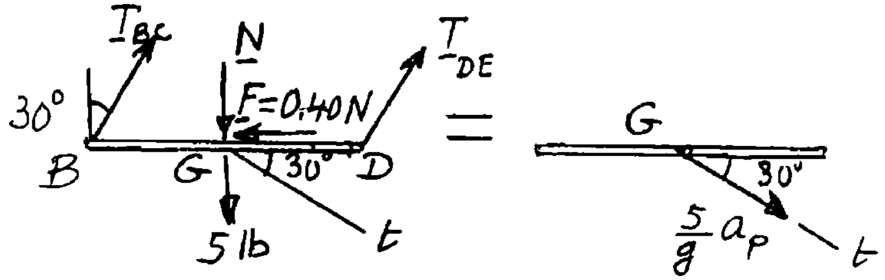
$$+\downarrow \Sigma F_y = \Sigma (F_y)_{\text{eff}}: \quad 30 - N = \frac{30}{g}(a_b)_y$$

$$(a_b)_y = g\left(1 - \frac{N}{30}\right) \tag{1}$$

$$\xrightarrow{+} \Sigma F_x = \Sigma (F_x)_{\text{eff}}: \quad 0.40\text{ N} = \frac{30}{g}(a_b)_x$$

$$(a_b)_x = g\left(\frac{N}{75}\right) \tag{2}$$

Equations of motion for platform.



$$+\searrow \Sigma F_t = \Sigma (F_t)_{\text{eff}}: \quad (N-5)\sin 30° - (0.40\text{ N})\cos 30° = \frac{5}{g}a_P$$

$$a_p = g(0.5 + 0.030718\text{ N}) \tag{3}$$

If contact is maintained between block and platform, we must have

$$(a_b)_y = (a_p)_y = a_p \sin 30° \tag{4}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 16.20 (Continued)

Substituting from (1) and (3) into (4):

$$g\left(1-\frac{N}{30}\right)=g(0.5+0.030718\text{ N})\sin 30°$$

$$(0.015359+0.033333)N=0.75$$

$$N=15.403\text{ lb}$$

Substituting for N in (2) and (1):

$$(a_b)_x=(32.2\text{ ft/s}^2)\,\frac{15.403}{75},\quad (\mathbf{a}_b)_x=6.61\text{ ft/s}^2\longrightarrow$$

$$(a_b)_y=(32.2\text{ ft/s}^2)\left(1-\frac{15.403}{30}\right),\quad (\mathbf{a}_b)_y=15.67\text{ ft/s}^2\downarrow$$

$$\mathbf{a}_b=17.01\text{ ft/s}^2\ \nwarrow 67.1° \blacktriangleleft$$

Substituting for N in (3):

$$a_P=(32.2\text{ ft/s}^2)(0.5+0.030718\times 15.403)=31.335\text{ ft/s}^2$$

$$\mathbf{a}_P=31.3\text{ ft/s}^2\ \nwarrow 30° \blacktriangleleft$$

Note: Since $N>0$, we check that contact between block and platform is maintained.

PROBLEM 16.21

Draw the shear and bending-moment diagrams for the vertical rod *AB* of Problem 16.16.

PROBLEM 16.16 Three bars, each of mass 3 kg, are welded together and are pin-connected to two links *BE* and *CF*. Neglecting the weight of the links, determine the force in each link immediately after the system is released from rest.

SOLUTION

From the solution of Problem 16.16, the acceleration of all points of vertical rod *AB* is

$$\mathbf{a} = 6.3057 \text{ m/s}^2 \measuredangle 40°$$

or $$\mathbf{a} = 4.8304 \text{ m/s}^2 \longrightarrow +4.0532 \text{ m/s}^2 \downarrow$$

Mass of rod *AB*: $m = 3 \text{ kg}$

Mass per unit length: $$\frac{m}{l} = \frac{3 \text{ kg}}{0.450 \text{ m}} = 6.6667 \text{ kg/m}$$

Effective force per length: $$\frac{m}{l}\mathbf{a}$$

$$(6.6667 \text{ kg/m})(4.8304 \text{ m/s}^2) \longrightarrow + (6.6667 \text{ kg/m})(4.0532 \text{ m/s}^2)$$

$$32.203 \text{ N/m} \longrightarrow + 27.021 \text{ N/m} \downarrow$$

Only the horizontal component contributes to the shear and bending moment. Let *x* be a vertical coordinate (positive down) with its origin at *A*. Draw the free body diagram of the portion of the rod *AB* lying above the section defined by *x*.

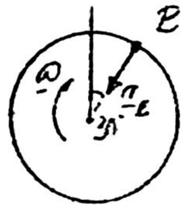
PROBLEM 16.22*

Draw the shear and bending-moment diagrams for the connecting rod *BC* of Problem 16.18.

PROBLEM 16.18 The 15-lb rod *BC* connects a disk centered at *A* to crank *CD*. Knowing that the disk is made to rotate at the constant speed of 180 rpm, determine for the position shown the vertical components of the forces exerted on rod *BC* by the pins at *B* and *C*.

SOLUTION

We first determine the acceleration of Point *B* of disk:



$$\omega = 180 \text{ rpm} = 18.85 \text{ rad/s}$$

Since $\omega = \text{constant}$

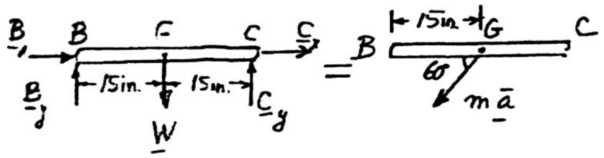
$$a_B = (a_B)_n = r\omega^2$$

$$= \left(\frac{8}{12}\text{ ft}\right)(18.85 \text{ rad/s})^2$$

$$\mathbf{a}_B = 236.9 \text{ ft/s}^2 \swarrow 60°$$

Since rod *BC* is in translation.

$$\bar{\mathbf{a}} = \mathbf{a}_B = 236.9 \text{ ft/s}^2 \swarrow 60°$$



$$+\circlearrowright \Sigma M_B = \Sigma(M_B)_{\text{eff}}: \quad C_y(30 \text{ in.}) - W(15 \text{ in.}) = -m\bar{a}\sin 60°(15 \text{ in.})$$

Since $W = 15$ lb and $m\bar{a} = \dfrac{15 \text{ lb}}{32.2}(236.9) = 110.36$ lb:

$$30C_y - (15)(15) = -110.36\sin 60°(15) = -95.57(15)$$

$$2C_y = -95.57 + 15 = -80.57, \quad C_y = -40.285 \text{ lb}$$

$$\mathbf{C}_y = 40.3 \text{ lb} \downarrow$$

$$+\uparrow \Sigma F_y = \Sigma(F_y)_{\text{eff}}: \quad B_y - W + C_y = -m\bar{a}\sin 60°$$

$$B_y = W - C_y - \frac{15}{32.2}(236.9)\sin 60° = 15 + 40.285 - 95.57$$

$$B_y = -40.285 \text{ lb} \qquad \mathbf{B}_y = 40.3 \text{ lb}\downarrow$$

$$a_y = 236.7\sin 60° \qquad \mathbf{a}_y = 205.2 \text{ ft/s}^2\downarrow$$

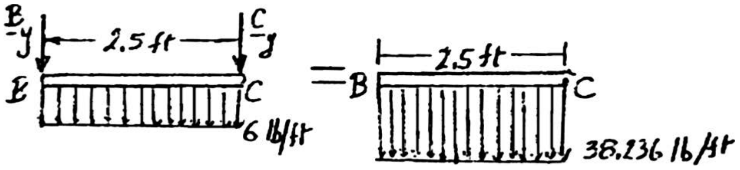
PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

$$\text{Distributed weight per unit length } = w = \frac{15 \text{ lb}}{\left(\frac{30}{12}\right)\text{ft}} = 6 \text{ lb/ft}$$

$$\text{Distributed mass per unit length } = \frac{w}{g} = \frac{6}{g} = \frac{6}{32.2} \text{lb} \cdot \text{s}^2/\text{ft}^2$$

$$\text{Vertical component of effective forces } = \frac{w}{g} a_y = \frac{6}{32.2}(205.2)$$

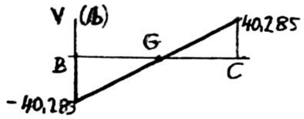
$$= 38.236 \text{ lb/ft}$$



$$+\!\downarrow \Sigma F_y = \Sigma (F_y)_{\text{eff}}: \quad B_y + C_y + (2.5 \text{ ft})(6 \text{ lb/ft}) = (2.5 \text{ ft})(38.236 \text{ lb/ft})$$

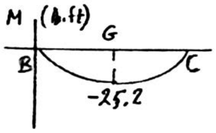
$$B_y + C_y = 80.59 \text{ lb}$$

From symmetry. $B_y = C_y = 40.285$ lb $\qquad \mathbf{B}_y = \mathbf{C}_y = 40.3 \text{ lb}\downarrow$



Maximum value of bending moment occurs at G, where $V = 0$:

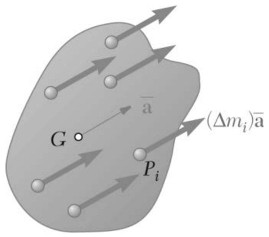
$$|M|_{\max} = \text{Area under } V\text{-diagram from } B \text{ to } G = \frac{1}{2}(40.285 \text{ lb})(1.25 \text{ ft})$$



$$|M|_{\max} = 25.2 \text{ lb} \cdot \text{ft} \blacktriangleleft$$

$$V_B = -40.3 \text{ lb} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

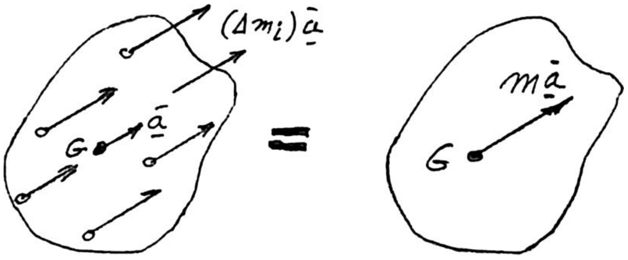


PROBLEM 16.23

For a rigid slab in translation, show that the system of the effective forces consists of vectors $(\Delta m_i)\bar{\mathbf{a}}$ attached to the various particles of the slab, where $\bar{\mathbf{a}}$ is the acceleration of the mass center *G* of the slab. Further show, by computing their sum and the sum of their moments about *G*, that the effective forces reduce to a single vector $m\bar{\mathbf{a}}$ attached at *G*.

SOLUTION

Since slab is in translation, each particle has same acceleration as *G*, namely $\bar{\mathbf{a}}$. The effective forces consist of $(\Delta mi)\bar{\mathbf{a}}$.



The sum of these vectors is: $\Sigma(\Delta m_i)\bar{\mathbf{a}} = (\Sigma\Delta m_i)\bar{\mathbf{a}}$

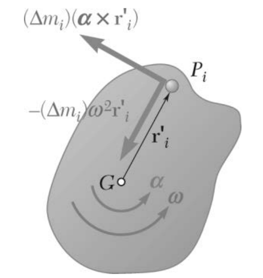
or since $\Sigma\Delta m_i = m,$

$$\Sigma(\Delta m_i)\bar{\mathbf{a}} = m\bar{\mathbf{a}}$$

The sum of the moments about *G* is: $\Sigma r_i' \times (\Delta m_i)\bar{\mathbf{a}} = (\Sigma\Delta m_i r_i') \times \bar{\mathbf{a}}$ (1)

But, $\Sigma\Delta m_i r_i' = m\bar{r}' = 0,$ because *G* is the mass center. It follows that the right-hand member of Eq. (1) is zero. Thus, the moment about *G* of $m\bar{a}$ must also be zero, which means that its line of action passes through *G* and that it may be attached at *G*.

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



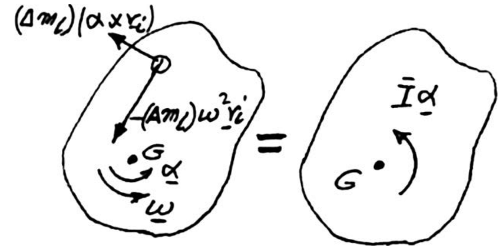
PROBLEM 16.24

For a rigid slab in centroidal rotation, show that the system of the effective forces consists of vectors $-(\Delta m_i)\boldsymbol{\omega}^2\mathbf{r}'_i$ and $(\Delta m_i)(\boldsymbol{\alpha}\times\mathbf{r}'_i)$ attached to the various particles P_i of the slab, where $\boldsymbol{\omega}$ and $\boldsymbol{\alpha}$ are the angular velocity and angular acceleration of the slab, and where $\mathbf{r}'_i$ denotes the position vector of the particle P_i relative to the mass center G of the slab. Further show, by computing their sum and the sum of their moments about G, that the effective forces reduce to a couple $\bar{I}\boldsymbol{\alpha}$.

SOLUTION

For centroidal rotation: $\mathbf{a}_i = (\mathbf{a}_i)_t + (\mathbf{a}_i)_n = \boldsymbol{\alpha}\times\mathbf{r}'_i - \omega^2\mathbf{r}'_i$

Effective forces are: $(\Delta m_i)a_i = (\Delta m_i)(\boldsymbol{\alpha}\times\mathbf{r}_i) - (\Delta m_i)\omega^2 r'_i(\Delta m_i)(\alpha\times\mathbf{r}_i)$



$$\Sigma(\Delta m_i)\mathbf{a}_i = \Sigma(\Delta m_i)(\boldsymbol{\alpha}\times\mathbf{r}'_i) - \Sigma(\Delta m_i)\omega^2 r'_i$$

$$= \alpha\times\Sigma(\Delta m_i)\mathbf{r}'_i - \omega^2\Sigma(\Delta m_i)r'_i$$

Since G is the mass center, $\Sigma(\Delta m_i)r'_i = 0$

effective forces reduce to a couple, Summing moments about G,

$$\Sigma(\mathbf{r}'_1\times\Delta m_i\mathbf{a}_i) = \Sigma[\mathbf{r}'_i\times(\Delta m_i)(\boldsymbol{\alpha}\times\mathbf{r}'_i)] - \Sigma\mathbf{r}'_i\times(\Delta m_i)\omega^2 r'_i$$

But, $\mathbf{r}'_i\times(\Delta m_i)\omega^2\mathbf{r}'_i = \omega^2(\Delta m_i)(\mathbf{r}'_i\times\mathbf{r}'_i) = 0$

and, $\mathbf{r}'_i\times(\Delta m_i)(\boldsymbol{\alpha}\times\mathbf{r}'_i) = (\Delta m_i)r_1'^2\boldsymbol{\alpha}$

Thus, $\Sigma(\mathbf{r}'_i\times\Delta m_i\mathbf{a}_i) = \Sigma(\Delta m_i)r_1^2\alpha = \left[\Sigma(\Delta m_i)r_i'^2\right]\alpha$

Since $\Sigma(\Delta m)r_i'^2 = \bar{I}$, the moment of the couple is $\bar{I}\boldsymbol{\alpha}$.

PROBLEM 16.25

The rotor of an electric motor has an angular velocity of 3600 rpm when the load and power are cut off. The 50-kg rotor, which has a centroidal radius of gyration of 180 mm, then coasts to rest. Knowing that kinetic friction results in a couple of magnitude $3.5\ \text{N}\cdot\text{m}$ exerted on the rotor, determine the number of revolutions that the rotor executes before coming to rest.

SOLUTION

$$\bar{I} = m\bar{k}^2 = (50)(0.180)^2 = 1.62\ \text{kg}\cdot\text{m}^2$$

$$M = \bar{I}\alpha: \quad 3.5\ \text{N}\cdot\text{m} = (1.62\ \text{kg}\cdot\text{m}^2)\alpha$$

$$\alpha = 2.1605\ \text{rad/s}^2\ \text{(deceleration)}$$

$$\omega_0 = 3600\ \text{rpm}\left(\frac{2\pi}{60}\right) = 120\pi\ \text{rad/s}$$

$$\omega^2 = \omega_0^2 + 2\alpha\theta$$

$$0 = (120\pi\ \text{rad/s})^2 + 2(-2.1605\ \text{rad/s}^2)\theta$$

$$\theta = 32.891\times 10^3\ \text{rad} = 5235.26\ \text{rev}$$

or $\theta = 5230\ \text{rev}$ ◀

PROBLEM 16.28

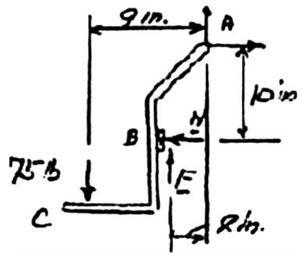
Solve Problem 16.27, assuming that the initial angular velocity of the flywheel is 360 rpm clockwise.

PROBLEM 16.27 The 8-in.-radius brake drum is attached to a larger flywheel that is not shown. The total mass moment of inertia of the drum and the flywheel is $14\ \text{lb}\cdot\text{ft}\cdot\text{s}^2$ and the coefficient of kinetic friction between the drum and the brake shoe is 0.35. Knowing that the angular velocity of the flywheel is 360 rpm counterclockwise when a force **P** of magnitude 75 lb is applied to the pedal *C*, determine the number of revolutions executed by the flywheel before it comes to rest.

SOLUTION

Lever *ABC*: Static equilibrium (friction force ↑)

$$F = \mu_k N = 0.35N$$



$$+\circlearrowleft \Sigma M_A = 0: \quad N(10\text{ in.}) + F(2\text{ in.}) - (75\text{ lb})(9\text{ in.}) = 0$$

$$10N + 2(0.35N) - 675 = 0$$

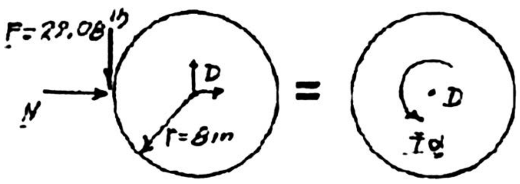
$$N = 63.08\text{ lb}$$

$$F = \mu_k N$$

$$= 0.35(63.08\text{ lb})$$

$$= 22.08\text{ lb}$$

Drum:



$$r = 8\text{ in.} = \frac{2}{3}\text{ft}$$

$$\omega_0 = 360\text{ rpm}\left(\frac{2\pi}{60}\right)$$

$$\omega_0 = 12\pi\text{ rad/s}$$

$$+\circlearrowright \Sigma M_D = \Sigma(M_D)_{\text{eff}} = 0: \quad Fr = \bar{I}\alpha$$

$$(22.08\text{ lb})\left(\frac{2}{3}\text{ft}\right) = (14\text{ lb}\cdot\text{ft}\cdot\text{s}^2)\alpha$$

$$\alpha = 1.0515\text{ rad/s}^2 \quad \text{(deceleration)}$$

$$\omega^2 = \omega_0^2 + 2\alpha\theta: \quad 0 = (12\pi\text{ rad/s})^2 + 2(-1.0515\text{ rad/s}^2)\theta$$

$$\theta = 675.8\text{ rad}$$

$$\theta = 675.8\text{ rad} = 107.56\text{ rev}$$

$\theta = 107.6\text{ rev}$ ◀

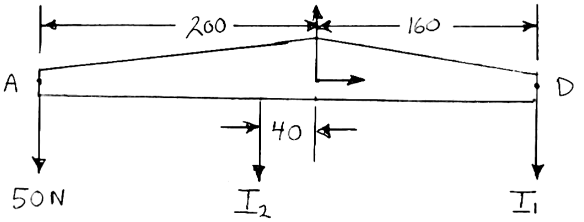
PROBLEM 16.29

The 100-mm-radius brake drum is attached to a flywheel which is not shown. The drum and flywheel together have a mass of 300 kg and a radius of gyration of 600 mm. The coefficient of kinetic friction between the brake band and the drum is 0.30. Knowing that a force **P** of magnitude 50 N is applied at A when the angular velocity is 180 rpm counterclockwise, determine the time required to stop the flywheel when a = 200 mm and b = 160 mm.

SOLUTION

Equilibrium of lever AD



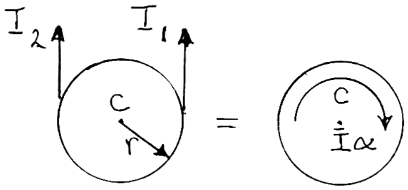
(Dimensions in mm)

$+\circlearrowleft \Sigma M_C = 0;$

$(50 \text{ N})(200) + T_2(40) - T_1(160) = 0$

$$4T_1 - T_2 = 250 \text{ N} \qquad (1)$$

Equation of Motion for flywheel and drum



$\bar{I} = m\bar{k}^2$

$= (300 \text{ kg})(0.600 \text{ m})^2$

$= 108 \text{ kg}\cdot\text{m}^2$

$r = 0.100 \text{ m}$

$+\circlearrowright \Sigma M_C = \Sigma(M_C)_{\text{eff}}: \quad T_2 r - T_1 r = \bar{I}\alpha$

$(T_2 - T_1)(0.100 \text{ m}) = 108\,\alpha$

$$\alpha = (925.93 \times 10^{-6})(T_2 - T_1) \qquad (2)$$

Belt Friction

Using μ_k instead of μ_s since the brake band is slipping:

$$\frac{T_2}{T_1} = e^{\mu_k \beta} \quad \text{or} \quad T_2 = T_1 e^{\mu_k \beta} \qquad (3)$$

Making $\mu_k = 0.30$ and $\beta = 180° = \pi$ rad in (3):

$$T_2 = T_1 e^{0.30\pi} \qquad T_2 = 2.5663 T_1 \qquad (4)$$

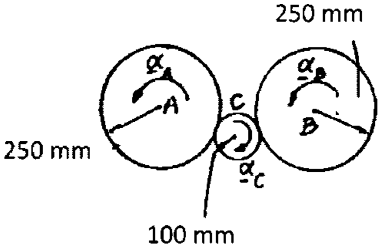
PROBLEM 16.35

Each of the gears A and B has a mass of 9 kg and has a radius of gyration of 200 mm; gear C has a mass of 3 kg and has a radius of gyration of 75 mm. If a couple **M** of constant magnitude 5 N-m is applied to gear C, determine (a) the angular acceleration of gear A, (b) the tangential force which gear C exerts on gear A.

SOLUTION

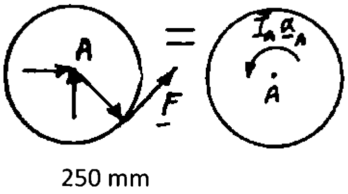
Kinematics:

We express that the tangential components of the accelerations of the gear teeth are equal:



$$a_t = 0.25\alpha_A$$
$$= 0.25\alpha_B$$
$$= 0.1\alpha_C$$
$$\alpha_B = \alpha_A$$
$$\alpha_C = 2.5\alpha_A \qquad (1)$$

Kinetics:



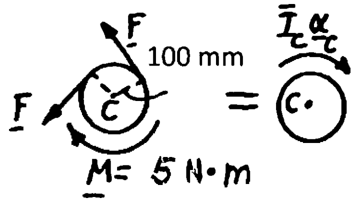
Gear A: $\qquad \bar{I}_A = m_A \bar{k}_A^2 = 9(0.20)^2$

$$= 0.36 \text{ kg}\cdot\text{m}^2$$

$$+\circlearrowleft \Sigma M_A = \Sigma(M_A)_{\text{eff}}: \quad F(0.25) = 0.36\alpha_A$$

$$F = 1.44\alpha_A \qquad (2)$$

Because of symmetry, gear C exerts an equal force F on gear B.



Gear C: $\qquad \bar{I}_C = m_C \bar{k}_C^2$

$$= 3(0.075)^2$$
$$= 0.016875 \text{ kg}\cdot\text{m}^2$$

$$+\circlearrowright \Sigma M_C = \Sigma(M_C)_{\text{eff}}: \quad M - 2Fr_C = \bar{I}_C\alpha_C$$

$$5 \text{ N}\cdot\text{m} - 2F(0.1 \text{ m}) = 0.016875\alpha_C$$

(a) Angular acceleration of gear A.

Substituting for α_C from (1) and for F from (2):

$$5 - 2(1.44\alpha_A)(0.1) = 0.016875(2.5\alpha_A)$$
$$5 - 0.288\alpha_A = 0.04219\alpha_A$$
$$5 = 0.3302\alpha_A$$
$$\alpha_A = 15.143 \text{ rad/s}^2$$

$$\boldsymbol{\alpha}_A = 15.14 \text{ rad/s}^2 \circlearrowleft \blacktriangleleft$$

(b) Tangential force F.

Substituting for α_A into (2): $\qquad F = 1.44(15.143)$

$$\mathbf{F}_A = 21.8 \text{ N} \nearrow \blacktriangleleft$$

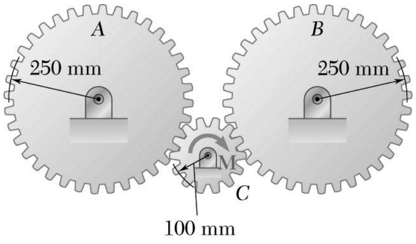
PROBLEM 16.36



Solve Problem 16.35, assuming that the couple **M** is applied to disk *A*.

PROBLEM 16.35 Each of the gears *A* and *B* has a mass of 9 kg and has a radius of gyration of 200 mm; gear *C* has a mass of 3 kg and has a radius of gyration of 75 mm. If a couple **M** of constant magnitude 5 N-m is applied to gear *C*, determine (*a*) the angular acceleration of gear *A*, (*b*) the tangential force which gear *C* exerts on gear *A*.

SOLUTION

Kinematics: $\boldsymbol{\alpha}_A = \alpha_A \circlearrowright \qquad \boldsymbol{\alpha}_A = \alpha_A \circlearrowleft \qquad \boldsymbol{\alpha}_B = \alpha_B \circlearrowright$

At the contact point between gears *A* and *C*,

$$a_t = r_A\alpha_A = r_C\alpha_C$$

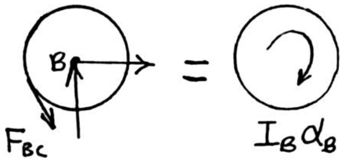
$$\alpha_C = \frac{r_A}{r_C}\alpha_A = \frac{0.25}{0.1}\alpha_A$$

At the contact point between gears *B* and *C*,

$$a_t = r_B\alpha_B = r_C\alpha_C$$

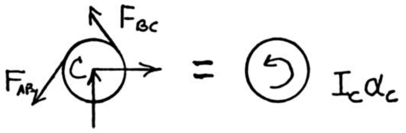
$$\alpha_B = \frac{r_C}{r_A}\alpha_C = \frac{0.1}{0.25}\cdot\frac{0.25}{0.1}\alpha_A = \alpha_A$$

Kinetics:



Gear *B*: $+\circlearrowright \Sigma M_B = \Sigma(M_B)_{\text{eff}}: \quad F_{BC}r_B = I_B\alpha_B = I_B\alpha_A$

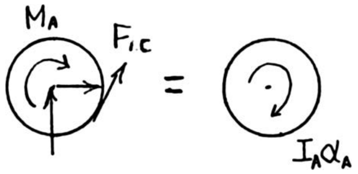
$$F_{BC} = \frac{I_B}{r_B}\alpha_A$$



Gear *C*: $+\circlearrowleft \Sigma M_C = \Sigma(M_C)_{\text{eff}}: \quad F_{BC}r_C + F_{AB}r_C = I_C\alpha_C$

$$\frac{r_C}{r_B}I_B\alpha_A + F_{AB}r_C = \frac{0.25}{0.1}I_C\alpha_A$$

$$F_{AC} = \frac{1}{r_C}\left(\frac{0.1}{0.25}I_B + \frac{0.25}{0.1}I_C\right)\alpha_A \qquad (1)$$



Gear *A*: $\circlearrowleft + M_A = \Sigma(M_A)_{\text{eff}}: \quad M_A - r_AF_{AB} = I_A\alpha_A$

$$M_A - \frac{r_A}{r_C}\left(\frac{0.1}{0.25}I_B + \frac{0.25}{0.1}I_C\right)\alpha_A = I_A\alpha_A$$

$$M_A = \left(I_A + I_B + \left(\frac{0.25}{0.1}\right)^2 I_C\right)\alpha_A \qquad (2)$$

PROBLEM 16.37

Gear A weighs 1 lb and has a radius of gyration of 1.3 in; Gear B weighs 6 lb and has a radius of gyration of 3 in.; gear C weighs 9 lb and has a radius of gyration of 4.3 in. Knowing a couple **M** of constant magnitude of 40 lb · in is applied to gear A, determine (a) the angular acceleration of gear C, (b) the tangential force which gear B exerts on gear C.

SOLUTION

Masses and moments of inertia.

$$m_A = \frac{1\text{ lb}}{32.2\text{ ft/s}^2} = 0.031056\text{ lb}\cdot\text{s}^2/\text{ft}$$

$$m_B = \frac{6\text{ lb}}{32.2\text{ ft/s}^2} = 0.18634\text{ lb}\cdot\text{s}^2/\text{ft}$$

$$m_C = \frac{9\text{ lb}}{32.2\text{ ft/s}^2} = 0.27950\text{ lb}\cdot\text{s}^2/\text{ft}$$

$$\bar{I}_A = m_A\bar{k}_A^2 = (0.031056\text{ lb}\cdot\text{s}^2/\text{ft})\left(\frac{1.3\text{ in.}}{12\text{ in./ft}}\right)^2$$

$$= 0.36448\times 10^{-3}\text{ lb}\cdot\text{s}^2\cdot\text{ft}$$

$$\bar{I}_B = m_B\bar{k}_B^2 = (0.18634\text{ lb}\cdot\text{s}^2/\text{ft})\left(\frac{3\text{ in.}}{12\text{ in./ft}}\right)^2$$

$$= 11.646\times 10^{-3}\text{ lb}\cdot\text{s}^2\cdot\text{ft}$$

$$\bar{I}_C = m_C\bar{k}_C^2 = (0.27950\text{ lb}\cdot\text{s}^2/\text{ft})\left(\frac{4.3\text{ in.}}{12\text{ in./ft}}\right)^2$$

$$= 35.889\times 10^{-3}\text{ lb}\cdot\text{s}^2\cdot\text{ft}$$

Kinematics. Gear A: $r_A = 2$ in.

Gear B: $r_1 = 4$ in., $r_2 = 2$ in.

Gear C: $r_C = 6$ in.

Point of contact between A and B.

$$a_t = r_A\alpha_A = r_1\alpha_B$$

$$\alpha_A = \frac{r_1}{r_A}\alpha_B = \frac{4\text{ in.}}{2\text{ in.}}\alpha_B$$

PROBLEM 16.38

Disks A and B are bolted together, and cylinders D and E are attached to separate cords wrapped on the disks. A single cord passes over disks B and C. Disk A weighs 20 lb and disks B and C each weigh 12 lb. Knowing that the system is released from rest and that no slipping occurs between the cords and the disks, determine the acceleration (a) of cylinder D, (b) of cylinder E.

SOLUTION

Masses and moments of inertia.

$$m_D = \frac{W_D}{g} = \frac{15\text{ lb}}{32.2\text{ ft/s}^2} = 0.46584\text{ lb}\cdot\text{s}^2/\text{ft}$$

$$m_E = \frac{W_E}{g}\frac{18\text{ lb}}{32.2\text{ ft/s}^2} = 0.55901\text{ lb}\cdot\text{s}^2/\text{ft}$$

Assume disks have uniform thickness.

$$I_A = \frac{1}{2}m_A r_A^2 = \frac{1}{2}\frac{20\text{ lb}}{32.2\text{ ft/s}^2}\left(\frac{8}{12}\text{ft}\right)^2 = 0.138026\text{ lb}\cdot\text{s}^2\cdot\text{ft}$$

$$I_B = \frac{1}{2}m_B r_B^2 = \frac{1}{2}\frac{12\text{ lb}}{32.2\text{ ft/s}^2}\left(\frac{6}{12}\text{ft}\right)^2 = 0.046584\text{ lb}\cdot\text{s}^2\cdot\text{ft}$$

$$I_C = I_B = 0.046584\text{ lb}\cdot\text{s}^2\cdot\text{ft}$$

$$I_{AB} = I_A + I_B = 0.184610\text{ lb}\cdot\text{s}^2\cdot\text{ft}$$

Kinematics: $\mathbf{a}_D = a_D\downarrow$, $\mathbf{a}_E = a_E\uparrow$, $\boldsymbol{\alpha}_{AB} = \alpha_{AB}\circlearrowleft$, $\boldsymbol{\alpha}_C = \alpha_C\circlearrowleft$

For inextensible cord between disk A and cylinder D,

$$a_D = (a_t)_A = r_1\alpha_{AB} = \left(\frac{8}{12}\text{ft}\right)\alpha_{AB} = 0.66667\alpha_{AB} \tag{1}$$

For inextensible cord between disks B and C,

$$r_2\alpha_{AB} = r_3\alpha_C$$

$$\alpha_C = \frac{r_2}{r_3}\alpha_{AB} = \left(\frac{6\text{ in.}}{6\text{ in.}}\right)\alpha_{AB} = \alpha_{AB}$$

For inextensible cord between disk C and cylinder E,

$$a_E = (a_t)_D = \left(\frac{6}{12}\text{ft}\right)\alpha_C = 0.5\alpha_{AB} \tag{2}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 16.38 (Continued)

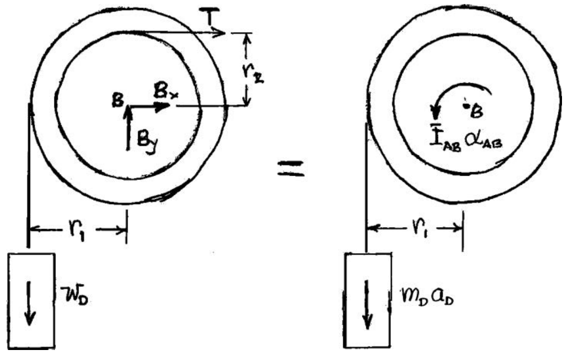
Kinetics.

Let T be the tension in the cord between disks B and C.



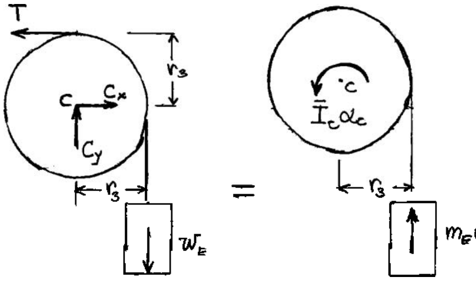
$$+\circlearrowleft \Sigma M_B = \Sigma(M_B)_{\text{eff}}: \quad r_1 W_D - r_2 T = I_{AB}\alpha_{AB} + r_1 m_D a_D$$

$$T = \frac{r_1}{r_2}W_D - \frac{I_{AB}\alpha_{AB}}{r_2} - \frac{r_1 m_D a_D}{r_2}$$

$$T = \frac{r_1}{r_2}W_D - \left[\frac{I_{AB}}{r_2} + \frac{m_D r_1^2}{r_2}\right]\alpha_{AB}$$

$$= \frac{8 \text{ in.}}{6 \text{ in.}}(15 \text{ lb}) - \left[\frac{0.184610}{6/12} + \frac{(0.46584)(8/12)^2}{6/12}\right]\alpha_{AB}$$

$$T = 20 \text{ lb} - 0.78330\alpha_{AB} \qquad (3)$$



$$+\circlearrowleft \Sigma M_C = \Sigma(M_C)_{\text{eff}}: \quad r_3 T - r_3 W_E = I_C\alpha_C + r_3 m_E a_E$$

$$T = W_E + \left[\frac{I_C}{r_3} + m_E r_3\right]\alpha_{AB}$$

$$T = 18 \text{ lb} + \left[\frac{0.046584}{6/12} + (0.55901)(6/12)\right]\alpha_{AB}$$

$$T = 18 \text{ lb} + 0.37267\alpha_{AB} \qquad (4)$$

Subtracting Eq. (4) from Eq. (3) to eliminate T,

$$0 = 2 \text{ lb} - 1.15597\alpha_{AB} \qquad \alpha_{AB} = 1.7301 \text{ rad/s}^2$$

(*a*) *Acceleration of cylinder D.*

From Eq. (1), $a_D = (0.66667)(7.7301)$ $\qquad \mathbf{a}_D = 1.153 \text{ ft/s}^2\downarrow$ ◀

(*b*) *Acceleration of cylinder E.*

From Eq. (2), $a_E = (0.5)(1.7301)$ $\qquad \mathbf{a}_E = 0.865 \text{ ft/s}^2\uparrow$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. PROBLEM 16.39

A belt of negligible mass passes between cylinders A and B and is pulled to the right with a force **P**. Cylinders A and B weigh, respectively, 5 and 20 lb. The shaft of cylinder A is free to slide in a vertical slot and the coefficients of friction between the belt and each of the cylinders are $\mu_s = 0.50$ and $\mu_k = 0.40$. For $P = 3.6$ lb, determine (a) whether slipping occurs between the belt and either cylinder, (b) the angular acceleration of each cylinder.

SOLUTION

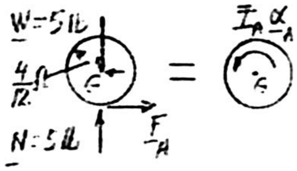
Assume that no slipping occurs.

Then:

$$a_{\text{belt}} = (4 \text{ in.})\alpha_A = (8 \text{ in.})\alpha_B \qquad \alpha_B = \frac{1}{2}\alpha_A \qquad (1)$$

Cylinder A.

$$+\circlearrowleft \Sigma M_G = \Sigma(M_G)_{\text{eff}}: \quad F_A\left(\frac{4}{12}\text{ft}\right) = \bar{I}_A\alpha_A$$

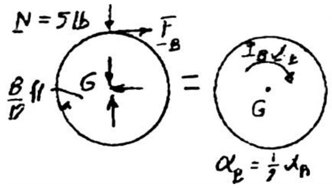


$$F_A\left(\frac{4}{12}\right) = \frac{1}{2}\frac{5}{g}\left(\frac{4}{12}\right)^2\alpha_A$$

$$F_A = \frac{5}{6}\frac{\alpha_A}{g} \qquad (2)$$

Cylinder B.

$$+\circlearrowright \Sigma M_G = \Sigma(M_G)_{\text{eff}}: \quad F_B\left(\frac{8}{12}\text{ft}\right) = \bar{I}_B\alpha_B$$



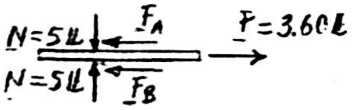
$$F_B\left(\frac{8}{12}\right) = \frac{1}{2}\frac{20}{g}\left(\frac{8}{12}\right)^2\left(\frac{1}{2}\alpha_A\right)$$

$$F_B = \frac{20}{6}\frac{\alpha_A}{g} \qquad (3)$$

Belt

$$\xrightarrow{+} \Sigma F_A = 0: \quad P - F_A - F_B = 0 \qquad (4)$$

$$3.60 - \frac{5}{6}\frac{\alpha_A}{g} - \frac{20}{6}\frac{\alpha_A}{g} = 0$$



$$\alpha_A = \frac{(3.60)6}{25}g$$

$$= 0.864g$$

$$\boldsymbol{\alpha}_A = 27.82 \text{ rad/s}^2 \circlearrowleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

Check that belt does not slip.

From (2): $F_A = \frac{5}{6}(0.864) = 0.720 \text{ lb}$

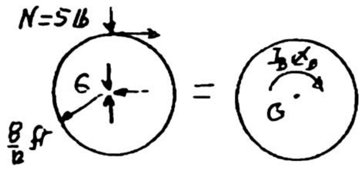
From (4): $F_e = P - F_A = 3.60 - 0.720 = 2.88 \text{ lb}$

But $F_m = \mu_s N = 0.50(5 \text{ lb}) = 2.50 \text{ lb}$

Since $F_e > F_m$, assumption is wrong.

<u>Slipping occurs between disk *B* and the belt</u>. ◀

<u>We redo analysis of *B*, assuming slipping</u>. $\left(\alpha_B \neq \frac{1}{2}\alpha_A\right)$



$$F_B = \mu_k N = 0.40(5 \text{ lb}) = 2 \text{ lb}$$

$$+\circlearrowright \Sigma M_G = \Sigma(M_G)_{\text{eff}}: \quad (2 \text{ lb})\left(\frac{8}{12}\text{ft}\right) = \frac{1}{2}\frac{20}{g}\left(\frac{8}{12}\right)^2 \alpha_B$$

$$\alpha_B = 0.3g, \qquad \boldsymbol{\alpha}_B = 9.66 \text{ rad/s}^2 \circlearrowright$$ ◀

<u>Belt</u> Eq. (4):

$$P - F_A - F_B = 0$$
$$F_A = P - F_B$$
$$= 3.60 - 2$$
$$= 1.60 \text{ lb}$$

Since $F_A < F_m$, <u>There is no slipping between *A* and the belt</u>. ◀

Our analysis of disk *A*, therefore is valid. Using Eq. (2),

We have $1.60 \text{ lb} = \frac{5}{6}\frac{\alpha_A}{g}$

$$\alpha_A = 1.92g \qquad \boldsymbol{\alpha}_A = 61.8 \text{ rad/s}^2 \circlearrowright$$ ◀

PROBLEM 16.40

Solve Problem 16.39 for $P = 2.00$ lb.

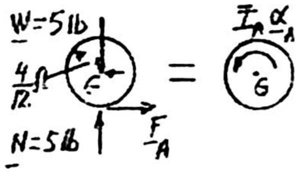
PROBLEM 16.39 A belt of negligible mass passes between cylinders A and B and is pulled to the right with a force **P**. Cylinders A and B weigh, respectively, 5 and 20 lb. The shaft of cylinder A is free to slide in a vertical slot and the coefficients of friction between the belt and each of the cylinders are $\mu_s = 0.50$ and $\mu_k = 0.40$. For $P = 3.60$ lb, determine (a) whether slipping occurs between the belt and either of the cylinders, (b) the angular acceleration of each cylinder.

SOLUTION

Assume that no slipping occurs.

Then: $$a_{\text{belt}} = (4\text{ in.})\alpha_A = (8\text{ in.})\alpha_B \qquad \alpha_B = \frac{1}{2}\alpha_A \qquad (1)$$

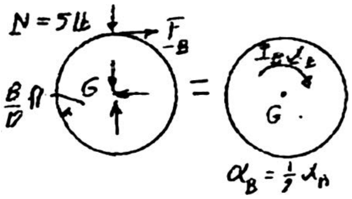
Cylinder A $\quad +\circlearrowleft \Sigma M_G = \Sigma(M_G)_{\text{eff}}: \quad F_A\left(\frac{4}{12}\text{ft}\right) = \bar{I}_A\alpha_A$



$$F_A\left(\frac{4}{12}\right) = \frac{1}{2}\frac{5}{g}\left(\frac{4}{12}\right)^2\alpha_A$$

$$F_A = \frac{5}{6}\frac{\alpha_A}{g} \qquad (2)$$

Cylinder B $\quad +\circlearrowleft \Sigma M_G = \Sigma(M_G)_{\text{eff}}: \quad F_B\left(\frac{4}{12}\text{ft}\right) = \bar{I}_B\alpha_B$

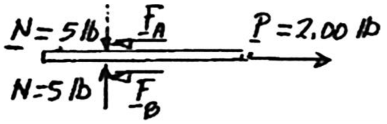


$$F_B\left(\frac{8}{12}\right) = \frac{1}{2}\frac{20}{g}\left(\frac{8}{12}\right)^2\left(\frac{1}{2}\alpha_A\right)$$

$$F_B = \frac{20}{6}\frac{\alpha_A}{g} \qquad (3)$$

Belt $\quad \xrightarrow{+} \Sigma F_A = 0: \quad P - F_A - F_B = 0$

$$2.00 - \frac{5}{6}\frac{\alpha_A}{g} - \frac{20}{6}\frac{\alpha_A}{g} = 0$$



$$\alpha_A = \frac{(2.00)6}{25}g$$

$$= 0.480g$$

$$\alpha_A = 15.46\text{ rad/s}^2 \circlearrowright$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

From (2): $F_A = \frac{5}{6}(0.480) = 0.400\text{ lb}$

From (4): $F_B = \frac{20}{6}(0.480) = 1.600\text{ lb}$

But $F_M = \mu_s N = 0.50(5\text{ lb}) = 2.50\text{ lb}$

Thus, F_A and F_B are both $< F_m$. Our assumption was right:

There is no slipping between cylinders and belt $\qquad \alpha_A = 15.46\text{ rad/s}^2 ↺$ ◀

From (1): $\qquad \alpha_B = 7.73\text{ rad/s}^2 ↻$ ◀

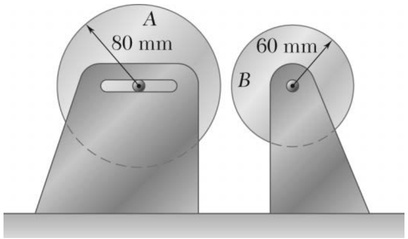
PROBLEM 16.41

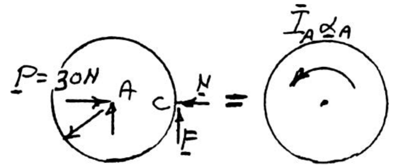


Disk A has a mass of 6 kg and an initial angular velocity of 360 rpm clockwise; disk B has a mass of 3 kg and is initially at rest. The disks are brought together by applying a horizontal force of magnitude 20 N to the axle of disk A. Knowing that $\mu_k = 0.15$ between the disks and neglecting bearing friction, determine (*a*) the angular acceleration of each disk, (*b*) the final angular velocity of each disk.

SOLUTION

While slipping occurs, a friction force $F\uparrow$ is applied to disk A, and $F\downarrow$ to disk B.

Disk A:



$$I_A = \frac{1}{2} m_A r_A^2$$

$$= \frac{1}{2}(6 \text{ kg})(0.08 \text{ m})^2$$

$$= 0.0192 \text{ kg} \cdot \text{m}^2$$

$$\Sigma F: \quad N = P = 20 \text{ N}$$

$$F = \mu N = 0.15(20) = 3 \text{ N}$$

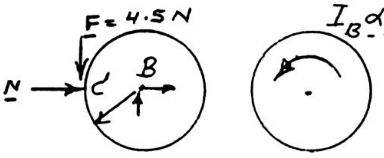
$$+\circlearrowright \Sigma M_A = \Sigma(M_A)_{\text{eff}}: \quad F r_A = \bar{I}_A \alpha_A$$

$$(3 \text{ N})(0.08 \text{ m}) = (0.0192 \text{ kg} \cdot \text{m}^2)\alpha_A$$

$$\alpha_A = 10.227$$

$$\boldsymbol{\alpha}_A = 12.50 \text{ rad/s}^2 \circlearrowleft \blacktriangleleft$$

Disk B:



$$\bar{I}_B = \frac{1}{2} m_B r_B^2$$

$$= \frac{1}{2}(3 \text{ kg})(0.06 \text{ m})^2$$

$$= 0.0054 \text{ kg} \cdot \text{m}^2$$

$$+\circlearrowright \Sigma M_B = \Sigma(M_B)_{\text{eff}}: \quad F r_B = \bar{I}_B \alpha_B$$

$$(3 \text{ N})(0.06 \text{ m}) = (0.0054 \text{ kg} \cdot \text{m}^2)\alpha_B$$

PROBLEM 16.44

Disk B is at rest when it is brought into contact with disk A, which has an initial angular velocity ω_0. (a) Show that the final angular velocities of the disks are independent of the coefficient of friction μ_k between the disks as long as $\mu_k \neq 0$. (b) Express the final angular velocity of disk A in terms of ω_0 and the ratio m_A/m_R of the masses of the two disks.

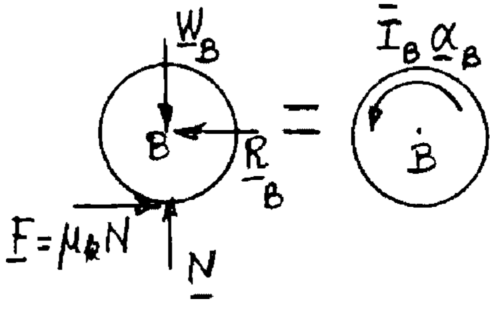
SOLUTION

(a) Disk B.

$$+\uparrow \Sigma F_y = \Sigma(F_y)_{\text{eff}}: \quad N - w_B = 0$$

$$N = w_B = m_B g$$

Thus, $$F = \mu_k N = \mu_k m_B g$$

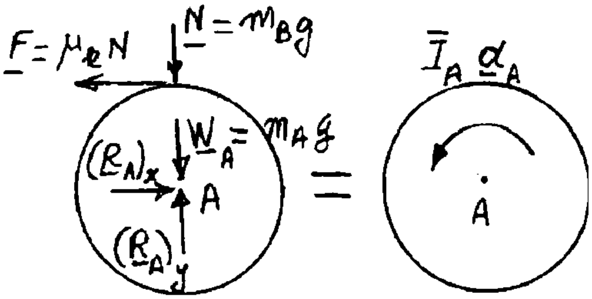


$$+\circlearrowright \Sigma M_B = \Sigma(M_B)_{\text{eff}}: \quad F r_B = \bar{I}_B \alpha_B$$

$$\mu_k m_B g r_B = \frac{1}{2} m_B r_B^2 \alpha_B$$

$$\boldsymbol{\alpha}_B = \frac{2\mu_k g}{r_B} \circlearrowright \tag{1}$$

Disk A.



$$+\circlearrowright \Sigma M_A = \Sigma(M_A)_{\text{eff}}: \quad F r_A = \bar{I}_A \alpha_A$$

$$\mu_k m_B g r_A = \frac{1}{2} m_A r_A^2 \alpha_A$$

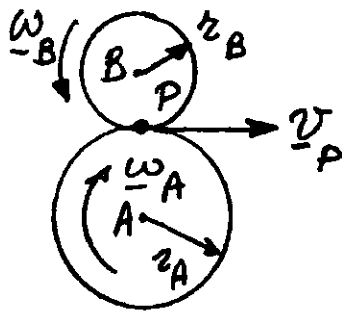
$$\boldsymbol{\alpha}_A = \frac{2\mu_k g}{r_A}\frac{m_B}{m_A} \circlearrowright \tag{2}$$

Disk A. $$\omega_A = \omega_0 - \alpha_A t = \omega_0 - \frac{2\mu_k g}{r_A}\frac{m_B}{m_A} t \circlearrowleft \tag{3}$$

Disk B. $$\omega_B = \alpha_B t = \frac{2\mu_k g}{r_B} t \circlearrowright \tag{4}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

When disks have stopped slipping:



$$v_P = \omega_A r_A = \omega_B r_B$$

$$\omega_0 r_A - (2\mu_k g)\frac{m_B}{m_A}t = 2\mu_k g t$$

$$t = \frac{\omega_0 r_A}{2\mu_k g}\frac{1}{1+\frac{m_B}{m_A}}$$

$$t = \frac{\omega_0 r_A}{2\mu_k g}\frac{m_A}{m_A + m_B} \qquad (5)$$

Substituting for t from (5) into (3) and (4):

$$\omega_A = \omega_0 - \frac{2\mu_k g}{r_A}\frac{m_B}{m_A}\frac{\omega_0 r_A}{2\mu_k g}\frac{m_A}{m_A + m_B} = \omega_0 - \frac{\omega_0 m_B}{m_A + m_B}$$

$$\omega_A = \omega_0 \frac{m_A + m_B - m_B}{m_A + m_B} \qquad \omega_A = \omega_0 \frac{m_A}{m_A + m_B} \circlearrowright \qquad (6)$$

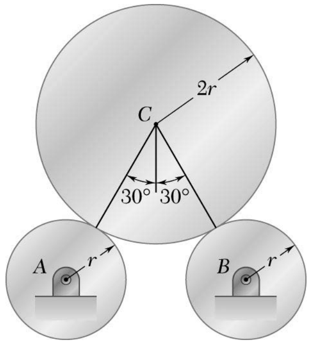
$$\omega_B = \frac{2\mu_k g}{r_A}\frac{\omega_0 r_A}{2\mu_k g}\frac{m_A}{m_A + m_B} \qquad \omega_B = \omega_0 \frac{r_A}{r_B}\frac{m_A}{m_A + m_B} \circlearrowleft \qquad (7)$$

(*a*) From Eqs. (6) and (7), it is apparent that ω_A and ω_B are independent of μ_k. However, if $\mu_k = 0$, we have from Eqs. (3) and (4) $\omega_A = \omega_0 \circlearrowright$ and $\omega_B = 0$.

(*b*) We can write (6) in the form $\omega_A = \omega_0/(1 + m_B/m_A) \circlearrowright$ ◀

which shows that ω_A depends only upon ω_0 and m_B/m_A.

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



PROBLEM 16.45

Cylinder A has an initial angular velocity of 720 rpm clockwise, and cylinders B and C are initially at rest. Disks A and B each weigh 5 lb and have a radius $r = 4$ in. Disk C weighs 20 lb and has a radius of 8 in. The disks are brought together when C is placed gently onto A and B. Knowing that $\mu_k = 0.25$ between A and C and no slipping occurs between B and C, determine (*a*) the angular acceleration of each disk, (*b*) the final angular velocity of each disk.

SOLUTION

Assume Point C, the center of cylinder C, does not move. This is true provided the cylinders remain in contact as shown. Slipping occurs initially between disks A and C and ceases when the tangential velocities at their contact point are equal. We first determine the angular accelerations of each disk while slipping occurs.

Masses and moments of inertia:

$$m_A = m_B = \frac{W_A}{g} = \frac{5 \text{ lb}}{32.2 \text{ ft/s}^2} = 0.15528 \text{ lb} \cdot \text{s}^2\text{/ft}$$

$$m_C = \frac{W_C}{g} = \frac{20 \text{ lb}}{32.2 \text{ ft/s}^2} = 0.62112 \text{ lb} \cdot \text{s}^2\text{/ft}$$

$$I_A = I_B = \frac{1}{2} m_A r^2 = \frac{1}{2}(0.15528)\left(\frac{4}{12}\right)^2 = 0.0086266 \text{ lb} \cdot \text{s}^2 \cdot \text{ft}$$

$$I_C = \frac{1}{2} m_C (2r)^2 = \frac{1}{2}(0.62112)\left(\frac{8}{12}\right)^2 = 0.138027 \text{ lb} \cdot \text{s}^2 \cdot \text{ft}$$

Kinematics: No slipping at contact BC.

$$(\mathbf{a}_t)_{BC} = (a_t)_{BC} \measuredangle 30°$$

$$(a_t)_{BC} = r\alpha_B = 2r\alpha_C \qquad \alpha_B = 2\alpha_C \tag{1}$$

Friction condition: $F_{AC} = \mu_k N_{AC}$ (2)

Kinetics:

Disk B: $\circlearrowright \Sigma F_B = \Sigma (F_B)_{\text{eff}}$:

$$F_{BC} r = I_B \alpha_B$$

$$F_{BC} = \frac{I_B}{r}\alpha_B = \frac{2I_B}{r}\alpha_C$$

$$F_{BC} = \frac{(2)(0.0086266)}{4/12}\alpha_C$$

$$= 0.051760\alpha_C \tag{3}$$

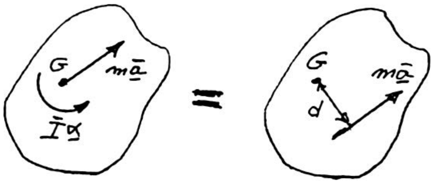
PROBLEM 16.46

Show that the system of the effective forces for a rigid slab in plane motion reduces to a single vector, and express the distance from the mass center G of the slab to the line of action of this vector in terms of the centroidal radius of gyration $\bar{k}$ of the slab, the magnitude $\bar{a}$ of the acceleration of G, and the angular acceleration α.

SOLUTION

We know that the system of effective forces can be reduced to the vector $m\bar{\mathbf{a}}$ at G and the couple $\bar{I}\boldsymbol{\alpha}$. We further know from Chapter 3 on statics that a force-couple system in a plane can be further reduced to a single force.

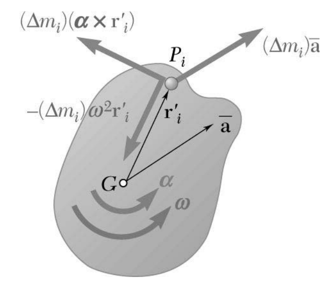


The perpendicular distance d from G to the line of action of the single vector $m\bar{\mathbf{a}}$ is expressed by writing

$$+\circlearrowleft \Sigma M_G = \Sigma (M_G)_{\text{eff}}: \quad \bar{I}\alpha = (m\bar{a})d$$

$$d = \frac{\bar{I}\alpha}{m\bar{a}} = \frac{m\bar{k}^2\alpha}{m\bar{a}} \qquad\qquad d = \frac{\bar{k}^2\alpha}{\bar{a}} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

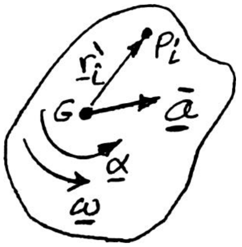


PROBLEM 16.47

For a rigid slab in plane motion, show that the system of the effective forces consists of vectors $(\Delta m_i)\,\bar{\mathbf{a}}$, $-(\Delta m_i)\omega^2\mathbf{r}_i'$, and $(\Delta m_i)(\boldsymbol{\alpha}\times\mathbf{r}_i')$ attached to the various particles P_i of the slab, where $\bar{\mathbf{a}}$ is the acceleration of the mass center G of the slab, $\boldsymbol{\omega}$ is the angular velocity of the slab, $\boldsymbol{\alpha}$ is its angular acceleration, and $\mathbf{r}_i'$ denotes the position vector of the particle P_i, relative to G. Further show, by computing their sum and the sum of their moments about G, that the effective forces reduce to a vector $m\bar{\mathbf{a}}$ attached at G and a couple $\bar{I}\boldsymbol{\alpha}$.

SOLUTION

Kinematics: The acceleration of P_L is



$$\mathbf{a}_i = \bar{\mathbf{a}} + \mathbf{a}_{P_i/G}$$

$$\mathbf{a}_i = \bar{\mathbf{a}} + \boldsymbol{\alpha}\times\mathbf{r}_i' + \boldsymbol{\omega}\times(\boldsymbol{\omega}\times\mathbf{r}_i')$$

$$= \bar{\mathbf{a}} + \boldsymbol{\alpha}\times\mathbf{r}_i' - \omega^2\mathbf{r}_i'$$

Note: that $\boldsymbol{\alpha}\times\mathbf{r}_i'$ is $\perp$ to $\mathbf{r}_i'$

Thus, the effective forces are as shown in Figure P16.47 (also shown above). We write

$$(\Delta m_i)\mathbf{a}_i = (\Delta m_i)\bar{\mathbf{a}} + (\Delta m_i)(\boldsymbol{\alpha}\times\mathbf{r}_i') - (\Delta m_i)\omega^2 r_i'$$

The sum of the effective forces is

$$\Sigma(\Delta m_i)\mathbf{a}_i = \Sigma(\Delta m_i)\bar{\mathbf{a}} + \Sigma(\Delta m_i)(\boldsymbol{\alpha}\times\mathbf{r}_i') - \Sigma(\Delta m_i)\omega^2\mathbf{r}_i'$$

$$\Sigma(\Delta m_i)\mathbf{a}_i = \bar{\mathbf{a}}\,\Sigma(\Delta m_i) + \boldsymbol{\alpha}\times\Sigma(\Delta m_i)\,\mathbf{r}_i' - \omega^2\Sigma(\Delta m_i)\mathbf{r}_i'$$

We note that $\Sigma(\Delta m_i) = m.$ And since G is the mass center,

$$\Sigma(\Delta m_i)\mathbf{r}_i' = m\,\overline{r}_i' = 0$$

Thus, $$\Sigma(\Delta m_i)\mathbf{a}_i = m\bar{\mathbf{a}} \qquad (1)$$

The sum of the moments about G of the effective forces is:

$$\Sigma(\mathbf{r}_i'\times\Delta m_i\mathbf{a}_i) = \Sigma\mathbf{r}_i'\times\Delta m_i\bar{\mathbf{a}} + \Sigma\mathbf{r}_i'\times(\Delta m_i)(\boldsymbol{\alpha}\times\mathbf{r}_i') - \Sigma\mathbf{r}_i'\times(\Delta m_i)\omega^2\mathbf{r}_i'$$

$$\Sigma(\mathbf{r}_i'\times\Delta m_i\mathbf{a}_i) = (\Sigma\mathbf{r}_i'\Delta m_i)\,\bar{\mathbf{a}} + \Sigma[\mathbf{r}_i'\times(\boldsymbol{\alpha}\times\mathbf{r}_i')\Delta m_i] - \omega^2\Sigma(\mathbf{r}_i'\times\mathbf{r}_i')\Delta m_i$$

Since G is the mass center, $\Sigma\mathbf{r}_i'\Delta m_i = 0$

Also, for each particle, $\mathbf{r}_i'\times\mathbf{r}_i' = 0$

Thus, $$\Sigma(\mathbf{r}_i'\times\Delta m_i\mathbf{a}_i) = \Sigma[\mathbf{r}_i'\times(\boldsymbol{\alpha}_i\times\mathbf{r}_i')\Delta m_i]$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

Since $\alpha \perp \mathbf{r}_i'$, we have $\mathbf{r}_i' \times (\boldsymbol{\alpha} \times \mathbf{r}_i') = r_i^2 \alpha$ and

$$\Sigma(\mathbf{r}_{ii}' \times \Delta m_i \mathbf{a}_i) = \Sigma r_i'^2 \, (\Delta m_i)\alpha$$
$$= (\Sigma r_i'^2 \, \Delta m_i)\boldsymbol{\alpha}$$

Since $\Sigma r_i'^2 \, \Delta m_i = \bar{I}$ $\qquad \Sigma(\mathbf{r}_i' \times \Delta m_i \mathbf{a}_i) = \bar{I}\alpha$ (2)

From Eqs. (1) and (2) we conclude that system of effective forces reduce to $m\bar{\mathbf{a}}$ attached at G and a couple $\bar{I}\boldsymbol{\alpha}$.

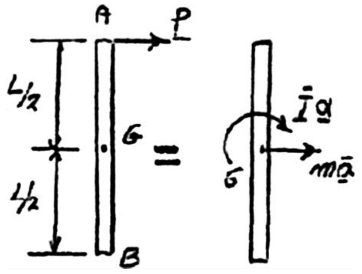
PROBLEM 16.48

A uniform slender rod AB rests on a frictionless horizontal surface, and a force **P** of magnitude 0.25 lb is applied at A in a direction perpendicular to the rod. Knowing that the rod weighs 1.75 lb, determine (a) the acceleration of Point A, (b) the acceleration of Point B, (c) the location of the point on the bar that has zero acceleration.

SOLUTION

$$m = \frac{W}{g}$$

$$I = \frac{1}{12}\frac{W}{g}L^2$$



$$\xrightarrow{+} \Sigma F_x = \Sigma (F_x)_{\text{eff}}: \quad P = m\bar{a} = \frac{W}{g}\bar{a}$$

$$\bar{a} = \frac{P}{W}g = \frac{0.25 \text{ lb}}{1.75 \text{ lb}}g = \frac{1}{7}g \qquad \bar{\mathbf{a}} = \frac{1}{7}g \longrightarrow$$

$$+\circlearrowright \Sigma M_G = \Sigma (M_G)_{\text{eff}}: \quad P\frac{L}{2} = \bar{I}\alpha = \frac{1}{12}\frac{W}{g}L^2\alpha$$

$$\alpha = 6\frac{P}{W}\frac{5}{L} = 6\frac{0.25 \text{ lb}}{1.75 \text{ lb}} \cdot \frac{g}{L} = \frac{6}{7}\frac{g}{L} \qquad \boldsymbol{\alpha} = \frac{6}{7}\frac{g}{L} \circlearrowright$$

We calculate the accelerations immediately after the force is applied. After the rod acquires angular velocity, there will be additional normal accelerations.

(a) Acceleration of Point A.

$$\xrightarrow{+} \mathbf{a}_A = \bar{\mathbf{a}} + \frac{L}{2}\alpha = \frac{1}{7}g + \frac{L}{2}\cdot\frac{6}{7}g = \frac{4}{7}g = \frac{4}{7}(32.2 \text{ ft/s}^2) \qquad \mathbf{a}_A = 18.40 \text{ ft/s}^2 \longrightarrow \blacktriangleleft$$

(b) Acceleration of Point B.

$$\xrightarrow{+} \mathbf{a}_B = \bar{\mathbf{a}} - \frac{L}{2}\alpha = \frac{1}{7}g - \frac{L}{2}\cdot\frac{6}{7}g = -\frac{2}{7}g = -\frac{2}{7}(32.2 \text{ ft/s}^2) \qquad \mathbf{a}_B = 9.20 \text{ ft/s}^2 \longleftarrow \blacktriangleleft$$

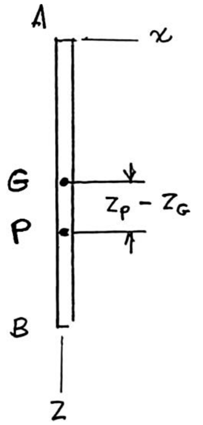
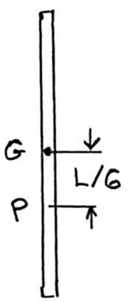
PROBLEM 16.48 (Continued)

(*c*) Point of zero acceleration.





$$a_P = 0$$

$$\bar{a} - (z_P - z_G)\alpha = 0$$

$$z_P - z_G = \frac{\bar{a}}{\alpha} = \frac{\frac{1}{7}g}{\frac{6}{7}\cdot\frac{g}{L}} = \frac{1}{6}L$$

Since $z_G = \frac{1}{2}L$

$$z_P = \frac{1}{2}L + \frac{1}{6}L = \frac{2}{3}L$$

$$z_P = \frac{2}{3}(36 \text{ in.})$$

$z_P = 24.0 \text{ in.}$ ◀

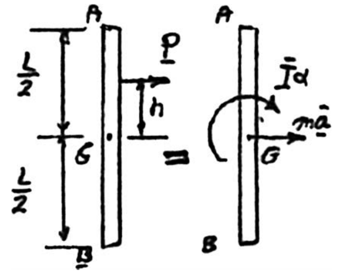
PROBLEM 16.49

(a) In Problem 16.48, determine the point of the rod AB at which the force **P** should be applied if the acceleration of Point B is to be zero. (b) Knowing that $P = 0.25$ lb, determine the corresponding acceleration of Point A.

SOLUTION



$$\xrightarrow{+} \Sigma F_x = \Sigma (F_X)_{\text{eff}}: \quad P = m\bar{a} = \frac{W}{g}\bar{a}$$

$$\mathbf{a} = \frac{P}{W} g \longrightarrow$$

$$\circlearrowright^{+} \Sigma M_G = \Sigma (M_G)_{\text{eff}}: \quad Ph = \bar{I}\alpha = \frac{1}{12}\frac{W}{g}L^2\alpha$$

$$\boldsymbol{\alpha} = \frac{12Ph}{WL^2} g \circlearrowright$$

(a) <u>Position of force P.</u>

$$\xrightarrow{+} \mathbf{a}_B = \bar{\mathbf{a}} - \frac{L}{2}\alpha$$

$$0 = \frac{P}{W}g - \frac{L}{2}\cdot\frac{12Ph}{WL^2}g$$

$$h = \frac{L}{6} = \frac{36 \text{ in.}}{6} = 6 \text{ in.}$$

Thus, P is located 12 in. from end A. ◀

For $\quad h = \frac{L}{6}: \quad \alpha = \frac{12P\left(\frac{L}{6}\right)}{WL^2} g = 2\frac{P}{W}\cdot\frac{g}{L} \circlearrowright$

(b) <u>Acceleration of Point A.</u>

$$\xrightarrow{+} a_A = \bar{a} + \frac{L}{2}\alpha = \frac{P}{W}g + \frac{L}{2}\cdot 2\frac{P}{W}\frac{g}{L} = 2\frac{P}{W}g$$

$$a_A = 2\frac{0.25 \text{ lb}}{1.75 \text{ lb}}(32.2 \text{ ft/s}^2)$$

$\mathbf{a}_A = 9.20 \text{ ft/s}^2 \longrightarrow$ ◀

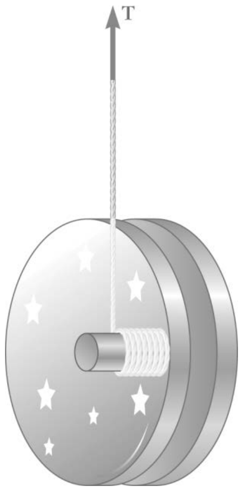
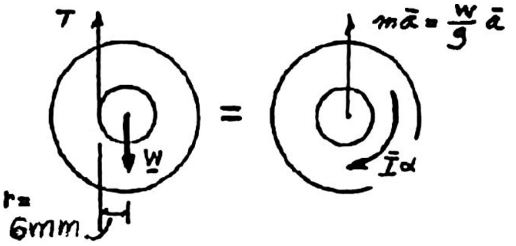
PROBLEM 16.56



The 80-g yo-yo shown has a centroidal radius of gyration of 30 mm. The radius of the inner drum on which a string is wound is 6 mm. Knowing that at the instant shown the acceleration of the center of the yo-yo is 1 m/s^2 upward, determine (*a*) the required tension **T** in the string, (*b*) the corresponding angular acceleration of the yo-yo.

SOLUTION



$$W = mg$$

$$W = 0.080 \text{ kg } (9.81 \text{ m/s}^2) = 0.7848 \text{ N}$$

$$+\uparrow \Sigma F_y = \Sigma(F_y)_{\text{eff}}: \quad T - W = \frac{W}{g}\bar{a}$$

$$T - (0.08 \text{ kg})(9.81 \text{ m/s}^2) = (0.08 \text{ kg})(1 \text{ m/s}^2)$$

$$T = 0.8648 \text{ N}$$

(*a*) *Tension in the string.* $T = 0.865 \text{ N}$ ◀

$$+\circlearrowright \Sigma M_G = \Sigma(M_G)_{\text{eff}}: \quad Tr = \bar{I}\alpha$$

$$(0.8648 \text{ N})(0.006 \text{ m}) = m\bar{k}^2\alpha$$

$$5.1888 \times 10^{-3} \text{ N} \cdot \text{m} = (0.08 \text{ kg})(0.03 \text{ m})^2 \alpha$$

(*b*) *Angular acceleration.*

$$\alpha = 72.067 \text{ rad/s}^2$$

$\alpha = 72.1 \text{ rad/s}^2 \circlearrowright$ ◀

PROBLEM 16.62

Two uniform cylinders, each of weight $W = 14$ lb and radius $r = 5$ in., are connected by a belt as shown. If the system is released from rest, determine (*a*) the angular acceleration of each cylinder, (*b*) the tension in the portion of belt connecting the two cylinders, (*c*) the velocity of the center of the cylinder *A* after it has moved through 3 ft.

SOLUTION

Kinematics

Let $\mathbf{a}_A = a_A \downarrow$ be the acceleration of the center of cylinder *A*, $\mathbf{a}_{AB} = a_{AB} \downarrow$ be acceleration of the cord between the disks, $\boldsymbol{\alpha}_A = \alpha_A \circlearrowright$ be the angular acceleration of disk *A*, and $\boldsymbol{\alpha}_B = \alpha_B \circlearrowright$ be the angular acceleration of disk *B*.

$$a_A = r\alpha_A \tag{1}$$

$$a_{AB} = a_A + r\alpha_A = 2r\alpha_A = r\alpha_B \tag{2}$$

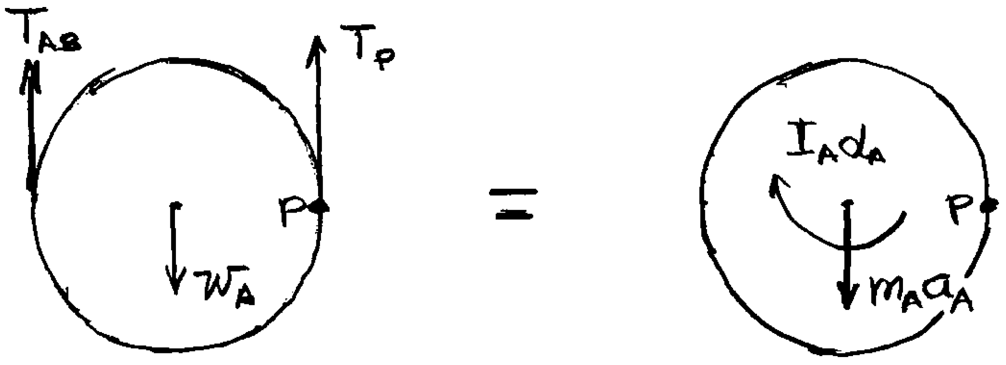
Masses and moments of inertia

$$m_A = m_B = m \tag{3}$$

$$\bar{I}_A = \bar{I}_B = \frac{1}{2}mr^2 \tag{4}$$

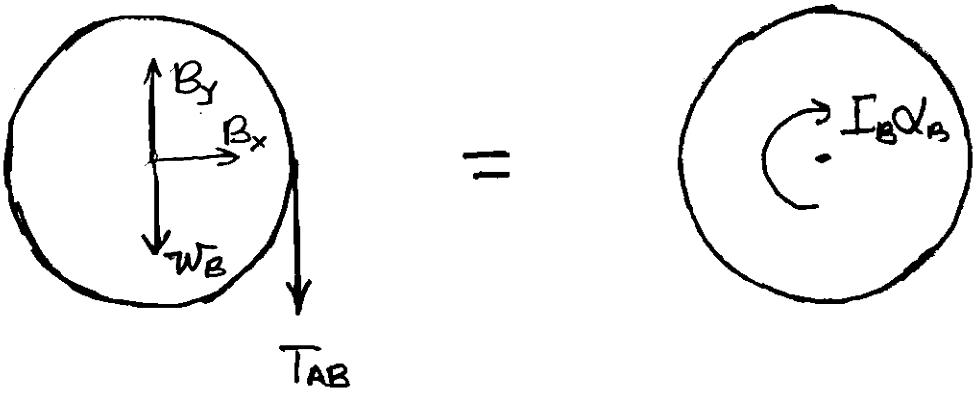
Kinetics: Let T_{AB} be the tension in the portion of the cable between disks *A* and *B*.

Disk *A*: $\circlearrowright \Sigma M_P = \Sigma(M_P)_{\text{eff}}: \quad rW_A - 2rT_{AB} = rm_A a_A + \bar{I}_A \alpha_A \tag{5}$



PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

Disk *B*: $\circlearrowright \Sigma M_B = \Sigma (M_B)_{\text{eff}}: \quad rT_{AB} = \bar{I}_B \alpha_B$ (6)



Add $2\times \text{Eq.}(6)$ to Eq. (5) to eliminate T_{AB}.

$$rW_A = rm_A a_A + \bar{I}_A \alpha_A + 2\bar{I}_B \alpha_B \quad (7)$$

Use Eqs. (1) and (2) to eliminate a_A and α_B

$$\begin{aligned} rW_A &= rm_A(r\alpha_A) + \bar{I}_A\alpha_A + 2\bar{I}_B \cdot (2\alpha_A) \\ &= (m_A r^2 + \bar{I}_A + 4\bar{I}_B)\alpha_A \\ &= \left[mr^2 + \frac{1}{2}mr^2 + 4\left(\frac{1}{2}mr^2\right)\right]\alpha_A \\ &= 3.5\, mr^2 \alpha_A \end{aligned}$$

$$\alpha_A = \frac{rW_A}{3.5\, mr^2} = \frac{1g}{3.5r}$$

$$\alpha_B = 2\alpha_A = \frac{2g}{3.5r}$$

From Eq. (2),
$$T_{AB} = \frac{\bar{I}_B \alpha_B}{r} = \frac{\left(\frac{1}{2}mr^2\right)(2g)}{3.5r^2}$$

$$= \frac{mg}{3.5} = \frac{W}{3.5}$$

Data: $W = 14$ lb, $g = 32.2$ ft/s^2,

$$r = 5 \text{ in.} = \frac{5}{12} \text{ ft}$$

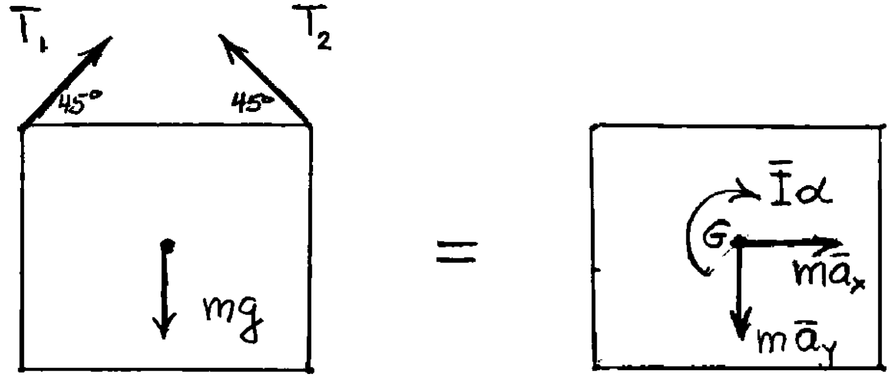
PROBLEM 16.68

A thin plate of the shape indicated and of mass m is suspended from two springs as shown. If spring 2 breaks, determine the acceleration at that instant (*a*) of Point *A*, (*b*) of Point *B*.

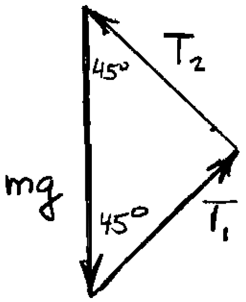
A rectangular plate of height b and width a.

SOLUTION

Moment of inertia. $\quad I = \dfrac{1}{12}m(a^2 + b^2)$



Statics: $\quad a_x = 0, \quad a_y = 0, \quad \alpha = 0$



Draw the force triangle showing equilibrium.

$$T_1 = T_2 = mg\sin 45°$$

Kinetics: $\quad T_2 = 0$

Since there is no time for displacements to occur, the tension in spring 1 remains equal to

$$T_1 = mg\sin 45°$$

Then $\quad \mathbf{T}_1 = \left[\frac{1}{2}mg \longrightarrow\right] + \left[\frac{1}{2}mg \uparrow\right]$

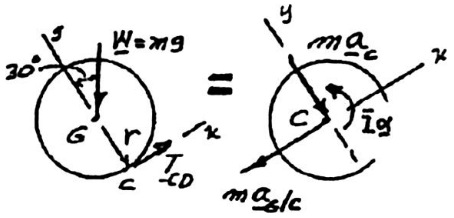
PROBLEM 16.F8

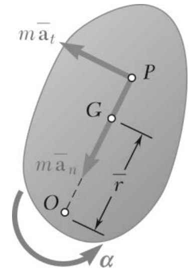
A uniform disk of mass $m = 4$ kg and radius $r = 150$ mm is supported by a belt $ABCD$ that is bolted to the disk at B and C. If the belt suddenly breaks at a point located between A and B, draw the FBD and KD for the disk immediately after the break.

SOLUTION

Answer:



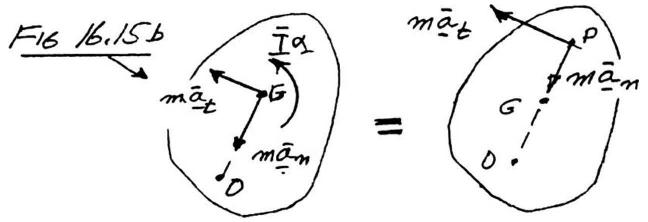
PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



PROBLEM 16.75

Show that the couple $\bar{I}\boldsymbol{\alpha}$ of Figure 16.15 can be eliminated by attaching the vectors $m\bar{\mathbf{a}}_t$ and $m\bar{\mathbf{a}}_n$ at a Point *P* called the *center of percussion,* located on line *OG* at a distance $GP = \bar{k}^2/\bar{r}$ from the mass center of the body.

SOLUTION



$$OG = \bar{r} \qquad \bar{\mathbf{a}}_t = \bar{r}\alpha$$

We first observe that the sum of the vectors is the same in both figures. To have the same sum of moments about *G*, we must have

$$+\circlearrowleft \Sigma M_G = \Sigma M_G: \quad \bar{I}\alpha = (m\bar{a}_t)(GP)$$

$$m\bar{k}^2\alpha = m\bar{r}\alpha(GP) \qquad\qquad GP = \frac{\bar{k}^2}{\bar{r}} \quad \text{(Q.E.D.)} \blacktriangleleft$$

Note: The center of rotation and the center of percussion are interchangeable. Indeed, since $OG = \bar{r},$ we may write

$$GP = \frac{\bar{k}^2}{GO} \quad \text{or} \quad GO = \frac{\bar{k}^2}{GP}$$

Thus, if Point *P* is selected as center of rotation, then Point *O* is the center of percussion.

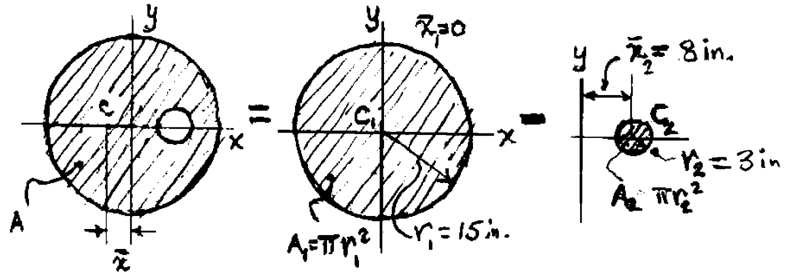
PROBLEM 16.82

A 6-in.-diameter hole is cut as shown in a thin disk of 15-in.-diameter. The disk rotates in a horizontal plane about its geometric center *A* at the constant rate of 480 rpm. Knowing that the disk has a mass of 60 lb after the hole has been cut, determine the horizontal component of the force exerted by the shaft on the disk at *A*.

SOLUTION

Determination of mass center of disk

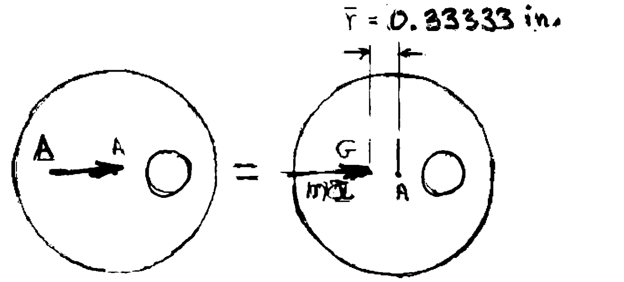
We determine the centroid of the composite area:



$$\bar{x}A = \bar{x}_1A_1 - \bar{x}_2A_2 \quad \text{or} \quad \bar{x}(A_1 - A_2) = \bar{x}_1A_1 - \bar{x}_2A_2$$

$$\bar{x} = \frac{\bar{x}A_1 - \bar{x}_2A_2}{A_1 - A_2} = \frac{0 - (8)\pi(3)^2}{\pi(15)^2 - \pi(3)^2} = -\frac{(8)(3)^2}{(15)^2 - (3)^2} = -0.33333 \text{ in.}$$

Kinetics



Mass center *G* coincides with centroid *C*

$\omega = 480 \text{ rpm} = 50.265 \text{ rad/s}$

$$\bar{a} = \bar{r}\omega^2 = \left(\frac{0.33333}{12}\right)(50.265 \text{ rad/s})^2 = 70.183 \text{ ft/s}^2$$

$$\Sigma F = \Sigma(F)_{\text{eff}}: \ \mathbf{A} = m\bar{\mathbf{a}} = \left(\frac{60 \text{ lb}}{32.2}\right)(70.183 \text{ ft/s}^2)$$

$\mathbf{A} = 130.8 \text{ N} \longrightarrow$ ◀

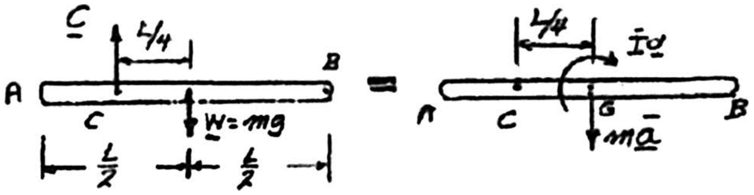
PROBLEM 16.85

A uniform rod of length L and mass m is supported as shown. If the cable attached at end B suddenly breaks, determine (a) the acceleration of end B, (b) the reaction at the pin support.

SOLUTION

$$\omega = 0 \qquad \bar{a} = \frac{L}{4}\alpha$$



$$+\circlearrowright \Sigma M_C = \Sigma(M_C)_{\text{eff}}: \quad W\frac{L}{4} = \bar{I}\alpha + m\bar{a}\frac{L}{4}$$

$$mg\frac{L}{4} = \frac{1}{12}mL^2\alpha + m\left(\frac{L}{4}\alpha\right)\frac{L}{4}$$

$$mg\frac{L}{4} = \frac{7}{48}mL^2\alpha \qquad \boldsymbol{\alpha} = \frac{12g}{7L} \circlearrowright$$

(b) Reaction at C.

$$+\uparrow \Sigma F_y = \Sigma(F_y)_{\text{eff}}: \quad C - mg = -m\bar{a} = -m\frac{L}{4}\alpha$$

$$C - mg = -m\left(\frac{L}{4}\right)\left(\frac{12g}{7L}\right)$$

$$C - mg = -\frac{3}{7}mg$$

$$C = \frac{4}{7}mg \qquad \mathbf{C} = \frac{4}{7}mg \uparrow \blacktriangleleft$$

(a) Acceleration of B.

$$a_B = a_C + a_{C/B} = 0 + \frac{3L}{4}\alpha$$

$$a_B = \frac{3L}{4}\left(\frac{12g}{7L}\right) = \frac{9}{7}g \qquad \mathbf{a}_B = \frac{9}{7}g \downarrow \blacktriangleleft$$

PROBLEM 16.86

A 12-lb uniform plate rotates about A in a vertical plane under the combined effect of gravity and of the vertical force **P**. Knowing that at the instant shown the plate has an angular velocity of 20 rad/s and an angular acceleration of 30 rad/s^2 both counterclockwise, determine (*a*) the force **P**, (*b*) the components of the reaction at A.

SOLUTION

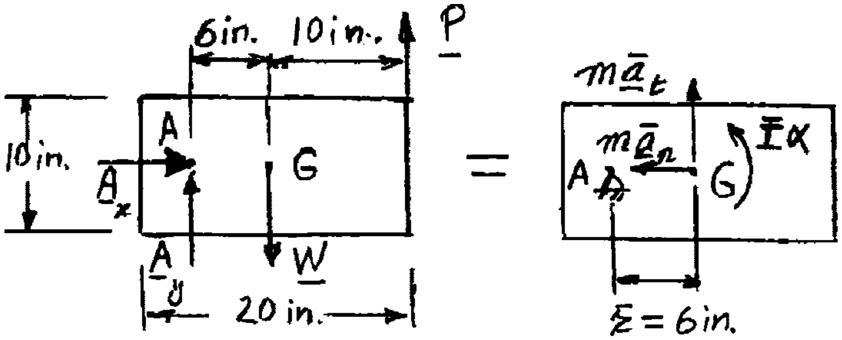
Kinematics.
$$\bar{a}_t = r\alpha = \left(\frac{6}{12}\text{ ft}\right)(30\text{ rad/s}^2) = 15\text{ ft/s}^2$$

$$\bar{a}_n = r\omega^2 = \left(\frac{6}{12}\text{ ft}\right)(20\text{ rad/s})^2 = 200\text{ ft/s}^2$$

Mass and moment of inertia.
$$m = \frac{W}{g} = \frac{12\text{ lb}}{32.2\text{ ft/s}^2} = 0.37267\text{ lb}\cdot\text{s}^2/\text{ft}$$

$$I = \frac{m}{12}\left[\left(\frac{10}{12}\right)^2 + \left(\frac{20}{12}\right)^2\right] = (0.37267\text{ lb}\cdot\text{s}^2/\text{ft})(0.28935\text{ ft}^2) = 0.10783\text{ lb}\cdot\text{s}^2\cdot\text{ft}$$

Kinetics.



(*a*) Force **P**.
$$+\circlearrowleft \Sigma M_A = \Sigma(M_A)_{\text{eff}}: \quad P\left(\frac{16}{12}\text{ ft}\right) - W\left(\frac{6}{12}\text{ ft}\right) = m\bar{a}_t\left(\frac{6}{12}\text{ ft}\right) + \bar{I}\alpha$$

$$\frac{4}{3}P = (12)\left(\frac{1}{2}\right) + (0.37267)(15)\left(\frac{1}{2}\right) + (0.10783)(30)$$

$$P = 9.0224\text{ lb.}$$

$\mathbf{P} = 9.02\text{ lb}\uparrow$ ◀

PROBLEM 16.88

Two uniform rods, *ABC* of weight 6-lb and *DCE* of weight 8-lb, are connected by a pin at *C* and by two cords *BD* and *BE*. The T-shaped assembly rotates in a vertical plane under the combined effect of gravity and of a couple **M** which is applied to rod *ABC*. Knowing that at the instant shown the tension in cord *BE* is 2 lb and the tension in cord *BD* is 0.5 lb, determine (*a*) the angular acceleration of the assembly, (*b*) the couple **M**.

SOLUTION

We first consider the *entire system* and express that the *external* forces are equivalent to the *effective* forces of both rods.

$$(\bar{a}_{AC})_t = 0.75\alpha$$

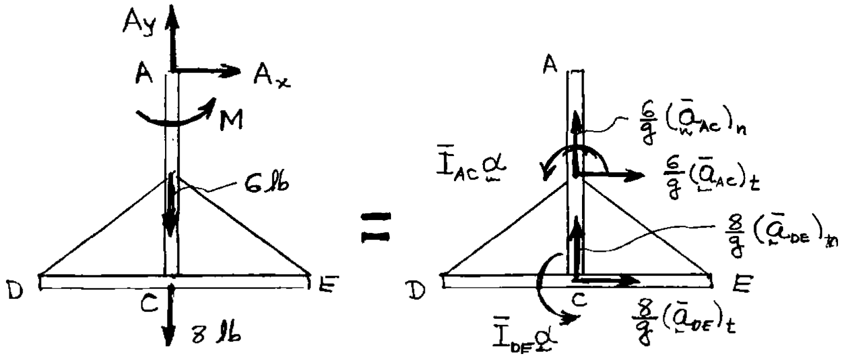
$$(\bar{a}_{DE})_t = 1.5\alpha$$

$$\bar{I}_{AC} = \frac{1}{12}\left(\frac{6\text{ lb}}{32.2}\right)(1.5\text{ ft})^2$$

$$= 34.938\times 10^{-3}\,\text{slug}\cdot\text{ft}^2$$

$$\bar{I}_{DE} = \frac{1}{12}\left(\frac{8\text{ lb}}{32.2}\right)(2\text{ ft})^2$$

$$= 82.816\times 10^{-3}\,\text{slug}\cdot\text{ft}^2$$



$$+\circlearrowleft \Sigma M_A = \Sigma(M_A)_{\text{eff}}:\quad M = \bar{I}_{AC}\alpha + \frac{6}{32.2}(\bar{a}_{AC})_t(0.75) + \bar{I}_{DE}\alpha + \frac{8}{32.2}(\bar{a}_{DE})_t(1.5)$$

$$M = 34.938\times 10^{-3}\alpha + \frac{6}{32.2}(0.75\alpha)(0.75) + 82.816\times 10^{-3}\alpha + \frac{8}{32.2}(1.5\alpha)(1.5)$$

$$M = 0.78157\alpha \qquad (1)$$

We now consider rod *DE* alone:

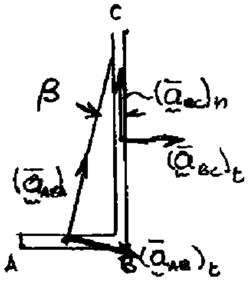
PROBLEM 16.89

The object ABC consists of two slender rods welded together at Point B. Rod AB has a weight of 2 lb and bar BC has a weight of 4 lb. Knowing the magnitude of the angular velocity of ABC is 10 rad/s when $\theta = 0$, determine the components of the reaction at Point C when $\theta = 0$.

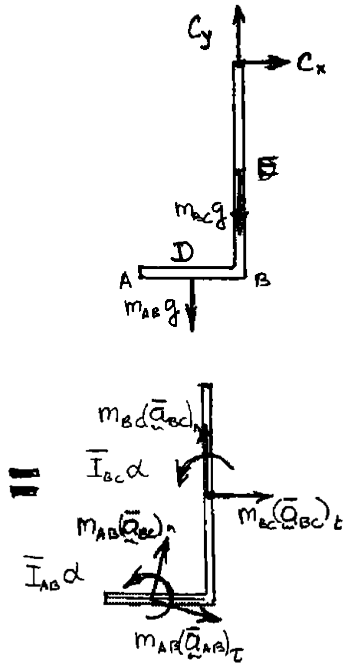
SOLUTION



Masses and lengths: $W_{AB} = 2\text{ lb}, \quad L_{AB} = 1\text{ ft}, \quad W_{BC} = 4\text{ lb}, \quad L_{BC} = 2\text{ ft}$

Moments of inertia:
$$\bar{I}_{AB} = \frac{1}{12} m_{AB} L_{AB}^2 = \frac{1}{12}\left(\frac{2}{32.2}\right)(1)^2 = 5.1760 \times 10^{-3}\text{ slug}\cdot\text{ft}^2$$
$$I_{BC} = \frac{1}{12} m_{BC} L_{BC}^2 = \frac{1}{12}\left(\frac{4}{32.2}\right)(2)^2 = 41.408 \times 10^{-3}\text{ slug}\cdot\text{ft}^2$$

Geometry:
$$r_{CD} = \sqrt{2^2 + 0.5^2} = 2.0616\text{ ft}$$
$$r_{CE} = \frac{1}{2} L_{AB} = 1\text{ ft}$$
$$\tan\beta = \frac{0.5}{2}$$
$$\beta = 14.036°$$



Kinematics: Let $\boldsymbol{\alpha} = \alpha \circlearrowleft$ be the angular acceleration of object ABC.

$$(\bar{\mathbf{a}}_{AB})_t = r_{CD}\alpha \nwarrow \beta$$
$$(\bar{\mathbf{a}}_{AB})_n = r_{CD}\omega^2 \nearrow \beta$$
$$(\bar{\mathbf{a}}_{BC})_t = r_{CE}\alpha \longrightarrow$$
$$(\bar{\mathbf{a}}_{BC})_n = r_{CE}\omega^2 \uparrow$$

Kinetics: $+\circlearrowleft \Sigma M_C = +\circlearrowleft \Sigma(M_C)_{\text{eff}}$: $\quad W_{AB}\dfrac{L_{AB}}{2} = \bar{I}_{AB}\alpha + r_{CD} m_{AB}(\bar{a}_{AB})_t$

$$+ \bar{I}_{BC}\alpha + r_{CE} m_{BC}(\bar{a}_{BC})_t$$
$$= \left(\bar{I}_{AB} + m_{AB} r_{CD}^2 + \bar{I}_{BC} + m_{BC} r_{CE}^2\right)\alpha$$

$$(2)(0.5) = \left[(5.1760\times 10^{-3}) + \left(\frac{2}{32.2}\right)(2.0616)^2 + (41.408\times 10^{-3}) + \left(\frac{4}{32.2}\right)(1)^2\right]\alpha \qquad \boldsymbol{\alpha} = 2.3\text{ rad/s}^2 \circlearrowleft$$

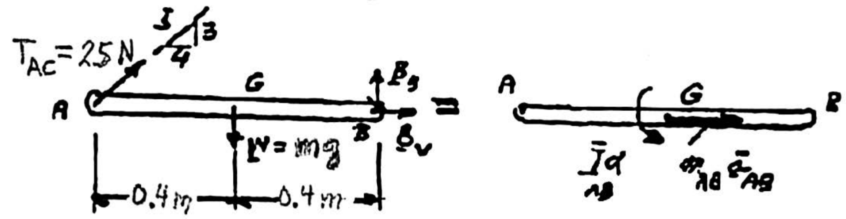
PROBLEM 16.90

A 3.5-kg slender rod *AB* and a 2-kg slender rod *BC* are connected by a pin at *B* and by the cord *AC*. The assembly can rotate in a vertical plane under the combined effect of gravity and a couple **M** applied to rod *BC*. Knowing that in the position shown the angular velocity of the assembly is zero and the tension in cord *AC* is equal to 25 N, determine (*a*) the angular acceleration of the assembly, (*b*) the magnitude of the couple **M**.

SOLUTION

(*a*) Angular acceleration.

Rod *AB*:
$$\bar{I}_{AB} = \frac{1}{12} m_{AB} L_{AB}^2$$
$$= \frac{1}{12} 3.5\text{ kg}(0.8\text{ m})^2$$
$$= 0.18667\text{ kg}\cdot\text{m}^2$$



$$+\circlearrowleft \Sigma M_B = \Sigma(M_B)_{\text{eff}}:\quad \frac{3}{5}(25\text{ N})(0.8\text{ m}) - (3.5\text{ kg})(9.81\text{ m/s}^2)(0.4\text{ m}) = \bar{I}_{AB}\alpha$$

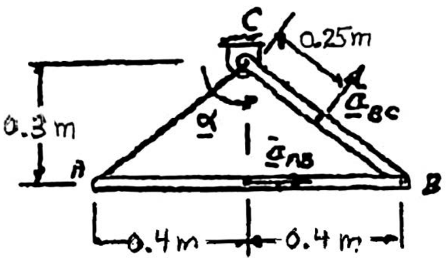
$$\bar{I}_{AB}\alpha = -1.7340\text{ N}\cdot\text{m} \qquad (1)$$

$$(0.18667\text{ kg}\cdot\text{m}^2)\alpha = -1.7340\text{ N}\cdot\text{m}$$

$$\boldsymbol{\alpha} = -9.2893\text{ rad/s}^2 \qquad \boldsymbol{\alpha} = 9.29\text{ rad/s}^2 \circlearrowleft \blacktriangleleft$$

Entire assembly: Since *AC* is taut, assembly rotates about *C* as a rigid body.

Kinematics:

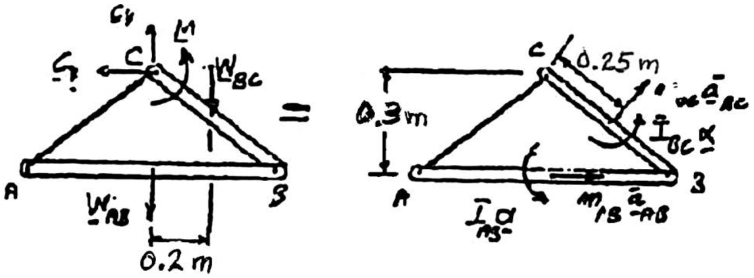


$$CB = \sqrt{(0.3)^2 + (0.4)^2} = 0.5\text{ m}$$
$$CG_{BC} = \frac{1}{2} CB = 0.25\text{ m}$$
$$\bar{\mathbf{a}}_{BC} = (0.25\text{ m})\alpha \nearrow$$
$$\bar{\mathbf{a}}_{AB} = (0.3\text{ m})\alpha \longrightarrow$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

Kinetics:

$$\bar{I}_{BC} = \frac{1}{12} m_{BC}(CB)^2$$
$$= \frac{1}{12}(2\text{ kg})(0.5\text{ m})^2$$
$$= 0.041667\text{ kg}\cdot\text{m}^2$$



(*b*) Couple **M**.

$$+\circlearrowright \Sigma M_C = \Sigma(M_C)_{\text{eff}}:$$

$$M - m_{BC}g(0.2\text{ m}) = m_{BC}\bar{a}_{BC}(0.25\text{ m}) + \bar{I}_{BC}\alpha + m_{AB}\bar{a}_{AB}(0.3\text{ m}) + \bar{I}_{AB}\alpha$$

$$M - (2\text{ kg})(9.81\text{ m/s}^2)(0.2\text{ m}) = 2\text{ kg}(0.25\text{ m})^2\alpha + (0.041667\text{ kg}\cdot\text{m}^2)\alpha + 3.5\text{ kg}(0.3\text{ m})^2\alpha + \bar{I}_{AB}\alpha$$

Substitute $\alpha = 9.29\text{ rad/s}^2$ $\quad \bar{I}_{AB}\alpha = -1.7340\text{ N}\cdot\text{m}$

$$M - 3.9240 = (0.125)(9.2893) + (0.041667)(9.2893)$$
$$+ (0.315)(9.2893) + (0.18667)(9.2893)$$
$$M - 3.9240 = 1.1612 + 0.3871 + 2.9261 + 1.7340$$
$$M - 3.9240 = 6.2084$$
$$M = +10.132\text{ N}\cdot\text{m}$$

$$\mathbf{M} = 10.13\text{ N}\cdot\text{m} \circlearrowright \blacktriangleleft$$

$$M - m_{BC}g(0.2\text{ m}) = I_C\alpha$$

Since C is fixed, we could also use: $M - (3.5\text{ kg})(9.81\text{ m/s}^2)(0.2\text{ m}) = \left(\frac{1}{3}m_{CB}\overline{CB}^2 + \bar{I}_{AB} + 3.5\text{ kg}(0.3\text{ m})^2\right)\alpha$

PROBLEM 16.91

A 9-kg uniform disk is attached to the 5-kg slender rod *AB* by means of frictionless pins at *B* and *C*. The assembly rotates in a vertical plane under the combined effect of gravity and of a couple **M** which is applied to rod *AB*. Knowing that at the instant shown the assembly has an angular velocity of 6 rad/s and an angular acceleration of 25 rad/s^2, both counterclockwise, determine (*a*) the couple **M**, (*b*) the force exerted by pin *C* on member *AB*.

SOLUTION

We first consider the entire system and express that the external forces are equivalent to the effective forces of the disk and the rod.

$$m_R = 5\text{ kg},\qquad m_D = 9\text{ kg}$$

$$W_R = m_D g = (5\text{ kg})(9.81\text{ m/s}^2) = 49.05\text{ N}$$

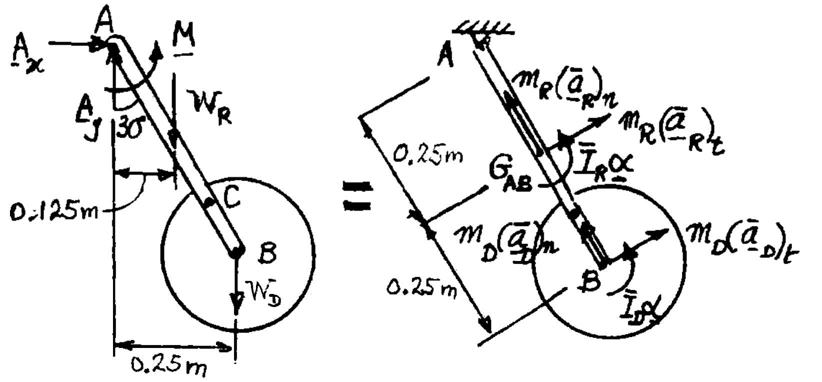
$$W_D = m_D g = (9\text{ kg})(9.81\text{ m/s}^2) = 88.29\text{ N}$$

$$I_R = \frac{1}{12}m_R L_{AB}^2 = \frac{1}{12}(5\text{ kg})(0.5\text{ m})^2 = 0.104167\text{ kg}\cdot\text{m}^2$$

$$I_D = \frac{1}{2}m_D r_D^2 = \frac{1}{2}(9\text{ kg})(0.2\text{ m})^2 = 0.18\text{ kg}\cdot\text{m}^2$$

$$\bar{a}_R = (0.25\text{ m})\alpha$$

$$\bar{a}_D = (0.5\text{ m})\alpha$$



(*a*) $\Sigma M_A = \Sigma(M_A)_{\text{eff}}:\quad M - W_R(0.125) - W_D(0.25) = \bar{I}_R\alpha + m_R(a_R)_t(0.25) + \bar{I}_D\alpha + m_D(\bar{a}_D)_t(0.5)$

$$M - (49.05)(0.125) - (88.29)(0.25) = 0.104167\alpha + (5)(0.25\alpha)(0.25) + 0.18\alpha + (9)(0.5\alpha)(0.5)$$

$$M - 6.1312 - 22.073 = (0.10417 + 0.3125 + 0.18 + 2.25)\alpha$$

$$M - 28.204 = (2.8467)(25)$$

$$M = 99.370\text{ N-m}$$

$M = 99.4$ N-m ⤹ ◀

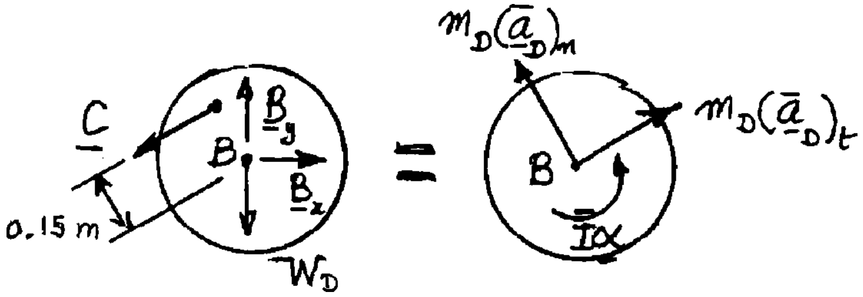
PROBLEM 16.91 (Continued)

(*b*) Consider now the disk alone:



$$+\circlearrowleft \Sigma M_B = \Sigma(M_B)_{\text{eff}}: \quad C(0.15) = \bar{I}_D\alpha = (0.18)(25)$$

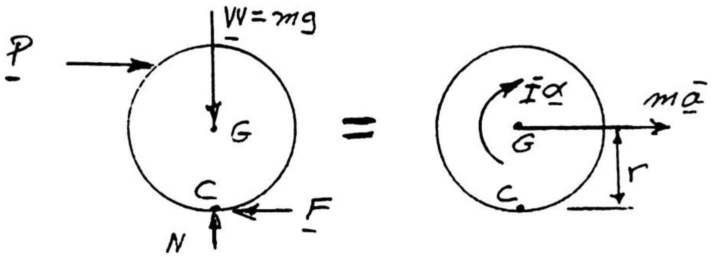
C = 30.0 N ∡ 30° ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 16.92

Derive the equation $\Sigma M_C = I_C\alpha$ for the rolling disk of Figure 16.17, where ΣM_C represents the sum of the moments of the external forces about the instantaneous center *C*, and I_C is the moment of inertia of the disk about *C*.

SOLUTION



$$+\circlearrowright \Sigma M_C = \Sigma(M_C)_{\text{eff}}: \quad \Sigma M_C = (m\bar{a})r + \bar{I}\alpha = (mr\alpha)\bar{r} + \bar{I}\alpha$$

$$= (mr\alpha)\bar{r} + \bar{I}\alpha$$

But, we know that $\quad I_C = mr^2 + \bar{I}$

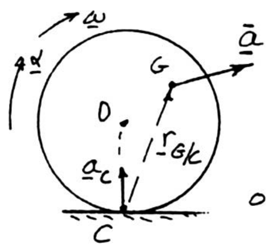
Thus: $\quad \Sigma M_C = I_C\alpha \quad$ (Q.E.D.) ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 16.93

Show that in the case of an unbalanced disk, the equation derived in Problem 16.92 is valid only when the mass center *G*, the geometric center *O*, and the instantaneous center *C* happen to lie in a straight line.

SOLUTION



Kinematics:

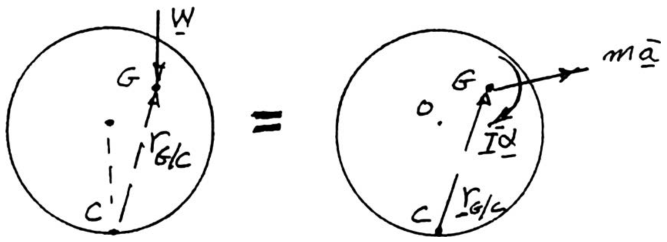
$$\bar{\mathbf{a}} = \mathbf{a}_C + \mathbf{a}_{G/C}$$

$$= \mathbf{a}_C + \boldsymbol{\alpha} \times \mathbf{r}_{G/C} + \boldsymbol{\omega} \times (\boldsymbol{\omega} \times \mathbf{r}_{G/C})$$

or, since $\boldsymbol{\omega} \perp \mathbf{r}_{G/C}$

$$\bar{\mathbf{a}} = \mathbf{a}_C + \boldsymbol{\alpha} \times \mathbf{r}_{G/C} - \omega^2 \mathbf{r}_{G/C} \quad (1)$$

Kinetics:



$$\Sigma M_C = \Sigma (M_C)_{\text{eff}}: \quad \Sigma \mathrm{M}_C = \bar{I}\boldsymbol{\alpha} + \mathbf{r}_{G/C} \times m\bar{\mathbf{a}}$$

Recall Eq. (1):
$$\Sigma \mathbf{M}_C = \bar{I}\alpha + \mathbf{r}_{G/C} \times m(\mathbf{a}_C + \boldsymbol{\alpha} \times \mathbf{r}_{G/C} - \omega^2 r_{G/C})$$

$$\Sigma \mathbf{M}_C = \bar{I}\alpha + \mathbf{r}_{G/C} \times m\mathbf{a}_C + m\mathbf{r}_{G/C} \times (\boldsymbol{\alpha} \times \mathbf{r}_{G/C}) - m\omega^2 \mathbf{r}_{G/C} \times \mathbf{r}_{G/C}$$

But:
$$\mathbf{r}_{G/C} \times \mathbf{r}_{G/C} = 0 \quad \text{and} \quad \boldsymbol{\alpha} \perp \mathbf{r}_{G/C}$$

$$\mathbf{r}_{G/C} \times m(\boldsymbol{\alpha} \times \mathbf{r}_{G/C}) = m r_{G/C}^2 \alpha$$

Thus:
$$\Sigma \mathbf{M}_C = \left(\bar{I} + m r_{G/C}^2\right)\alpha + \mathbf{r}_{G/C} \times m\mathbf{a}_C$$

Since
$$I_C = \bar{I} + m r_{G/C}^2$$

$$\Sigma \mathbf{M}_C = I_C \alpha + \mathbf{r}_{G/C} \times m\mathbf{a}_C \quad (2)$$

Eq. (2) reduces to $\Sigma M_C = I_C \alpha$ when $\mathbf{r}_{G/C} \times m\mathbf{a}_C = 0$; that is, when $\mathbf{r}_{G/C}$ and $\mathbf{a}_C$ are collinear.

Referring to the first diagram, we note that this will occur only when Points *G*, *O*, and *C* lie in a straight line.

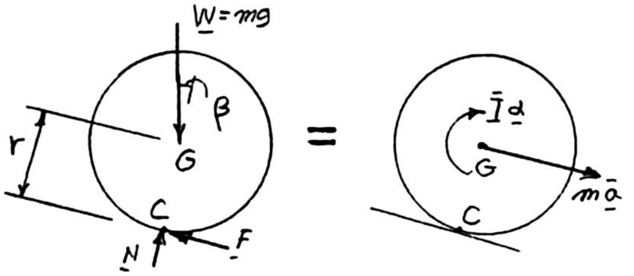
PROBLEM 16.94

A wheel of radius r and centroidal radius of gyration $\bar{k}$ is released from rest on the incline and rolls without sliding. Derive an expression for the acceleration of the center of the wheel in terms of r, $\bar{k}$, β, and g.

SOLUTION

$$\bar{I}\alpha = m\bar{k}^2\alpha$$

$$m\bar{a} = mr\alpha$$



$$+\circlearrowright \Sigma M_C = \Sigma(M_C)_{\text{eff}}: \quad (W\sin\beta)r = (m\bar{a})r + \bar{I}\alpha$$

$$(mg\sin\beta)r = (mr\alpha)r + m\bar{k}^2\alpha$$

$$rg\sin\beta = (r^2 + \bar{k}^2)\alpha$$

$$\alpha = \frac{rg\sin\beta}{r^2 + \bar{k}^2}$$

$$\bar{a} = r\alpha = r\frac{rg\sin\beta}{r^2 + k^2} \qquad \bar{a} = \frac{r^2}{r^2 + \bar{k}^2} g\sin\beta \blacktriangleleft$$

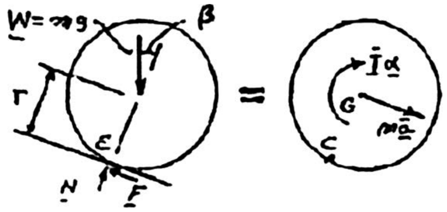
PROBLEM 16.95

A homogeneous sphere S, a uniform cylinder C, and a thin pipe P are in contact when they are released from rest on the incline shown. Knowing that all three objects roll without slipping, determine, after 4 s of motion, the clear distance between (a) the pipe and the cylinder, (b) the cylinder and the sphere.

SOLUTION

General case: $\bar{I} = m\bar{k}^2 \quad \bar{a} = r\alpha$

$$+\circlearrowleft \Sigma M_C = \Sigma(M_C)_{\text{eff}}: \quad (w\sin\beta)r = \bar{I}\alpha + m\bar{a}r$$



$$mg\sin\beta r = m\bar{k}^2\alpha + mr^2\alpha$$

$$\alpha = \frac{r\theta\sin\beta}{r^2+\bar{k}^2}$$

$$\bar{a} = r\alpha = r\frac{rg\sin\beta}{r^2+\bar{k}^2} \quad \bar{a} = \frac{r^2}{r^2+\bar{k}^2}g\sin\beta \tag{1}$$

For pipe: $\bar{k} = r \qquad \bar{a}_P = \dfrac{r^2}{r^2+r^2}g\sin\beta = \dfrac{1}{2}g\sin\beta$

For cylinder: $\bar{k}^2 = \dfrac{1}{2} \qquad a_C = \dfrac{r^2}{r^2+\dfrac{r^2}{2}}g\sin\beta = \dfrac{2}{3}g\sin\beta$

For sphere: $\bar{k}^2 = \dfrac{2}{5} \qquad a_S = \dfrac{r^2}{r^2+\dfrac{2}{5}r^2}g\sin\beta = \dfrac{5}{7}g\sin\beta$

(a) Between pipe and cylinder.

$$a_{C/P} = a_C - a_P = \left(\frac{2}{3}-\frac{1}{2}\right)g\sin\beta = \frac{1}{6}g\sin\beta$$

$$x_{C/P} = \frac{1}{2}a_{C/P}t^2 = \frac{1}{2}\left(\frac{1}{6}g\sin\beta\right)t^2$$

SI units: $x_{C/P} = \dfrac{1}{2}\left(\dfrac{1}{6}9.81\text{ m/s}^2\right)\sin 10°(4\text{ s})^2 = 2.27\text{ m}$ ◀

US units: $x_{C/P} = \dfrac{1}{2}\left(\dfrac{1}{6}32.2\text{ ft/s}^2\right)\sin 10°(4\text{ s})^2 = 7.46\text{ ft}$ ◀

PROBLEM 16.96

A 40-kg flywheel of radius $R = 0.5$ m is rigidly attached to a shaft of radius $r = 0.05$ m that can roll along parallel rails. A cord is attached as shown and pulled with a force **P** of magnitude 150 N. Knowing the centroidal radius of gyration is $\bar{k} = 0.4$ m, determine (*a*) the angular acceleration of the flywheel, (*b*) the velocity of the center of gravity after 5 s.

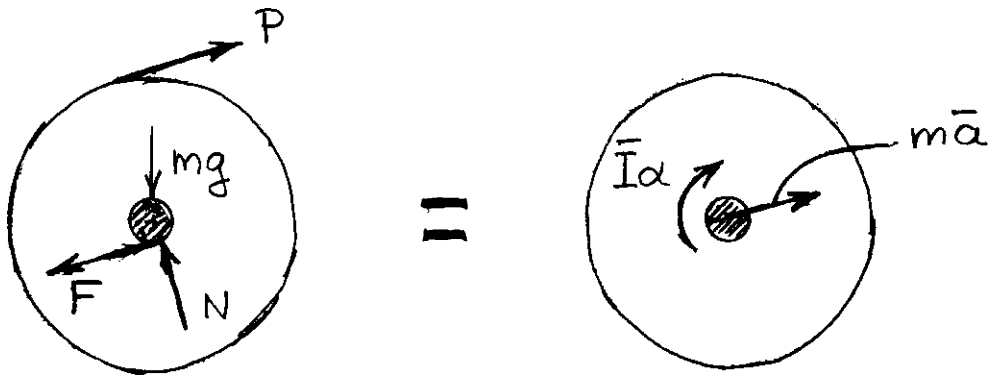
SOLUTION

Mass and moment of inertia: $m = 40$ kg

$$\bar{I} = m\bar{k}^2 = (40\text{ kg})(0.4\text{ m})^2 = 6.4\text{ kg}\cdot\text{m}^2$$

Kinematics: (no slipping) $\bar{\mathbf{a}} = r\alpha \measuredangle 15°$

Kinetics:



Let Point C be the contact point between the flywheel and the rails.

$$+\circlearrowright \Sigma M_C = \Sigma(M_C)_{\text{eff}}: \quad P(R+r) - mgr\sin 15° = \bar{I}\alpha + (m\bar{a})r$$

$$P(R+r) - mgr\sin 15° = (\bar{I} + mr^2)\alpha$$

(*a*) *Angular acceleration of the flywheel.*

$$\alpha = \frac{P(R+r) - mgr\sin 15°}{\bar{I} + mr^2}$$

$$= \frac{(150\text{ N})(0.55\text{ m}) - (40\text{ kg})(9.81\text{ m/s}^2)(0.05\text{ m})\sin 15°}{(6.4\text{ kg}\cdot\text{m}^2) + (40\text{ kg})(0.05\text{ m})^2}$$

$$= 11.911\text{ rad/s}^2 \qquad \boldsymbol{\alpha} = 11.91\text{ rad/s}^2 \circlearrowright \blacktriangleleft$$

PROBLEM 16.97

A 40-kg flywheel of radius R = 0.5 m is rigidly attached to a shaft of radius r = 0.05 m that can roll along parallel rails. A cord is attached as shown and pulled with a force **P**. Knowing the centroidal radius of gyration is $\bar{k} = 0.4\text{ m}$ and the coefficient of static friction is $\mu_s = 0.4$, determine the largest magnitude of force **P** for which no slipping will occur.

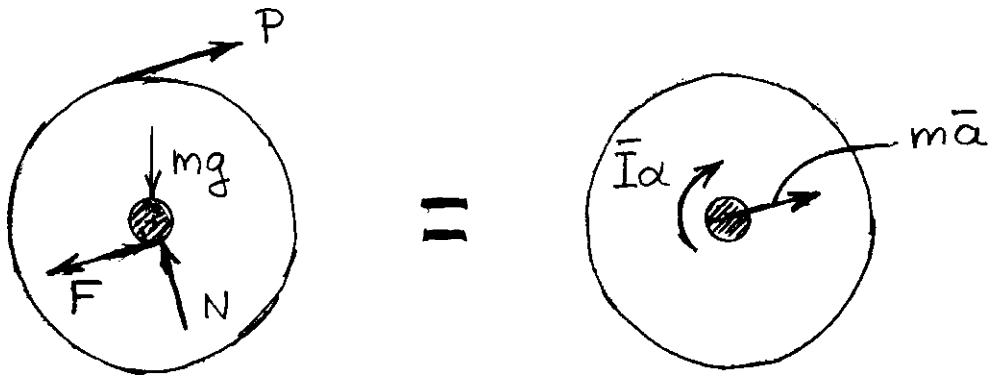
SOLUTION

Mass and moment of inertia: $m = 40\text{ kg}$

$$\bar{I} = m\bar{k}^2 = (40\text{ kg})(0.4\text{ m})^2 = 6.4\text{ kg}\cdot\text{m}^2$$

Kinematics: (no slipping) $\bar{\mathbf{a}} = r\alpha \measuredangle 15°$

Kinetics:



$$+\Sigma F_n = \Sigma(F_n)_{\text{eff}}: \quad N - mg\cos 15° = 0$$

$$N = (40\text{ kg})(9.81\text{ m/s}^2)\cos 15° = 379.03\text{ N}$$

For impending slipping,

$$F = \mu_s N = (0.4)(379.03)$$
$$= 151.61\text{ N}$$

$$+\measuredangle 15° \; \Sigma F = \Sigma(F)_{\text{eff}}: \quad P - F - mg\sin 15° = ma$$

$$P - 151.61\text{ N} = (40\text{ kg})(9.81\text{ m/s}^2)\sin 15° = (40\text{ kg})(0.05\text{ m})\alpha$$

$$P - 253.17\text{ N} = (2\text{ kg}\cdot\text{m})\alpha \qquad (1)$$

(*a*) $+\circlearrowright \Sigma M_A = \Sigma (M_A)_{\text{eff}}:$

$$W_{AB}(0.1) + W_C(0.2) - Q(0.3) = (m_{AB}\,\bar{a})\,0.1 + \bar{I}_{AB}\alpha_{AB} + (m_C\, a_B)0.2 - \bar{I}_C\alpha_C$$

$$(3)g(0.1) + (5)g(0.2) - Q(0.3) = 3(0.1\alpha_{AB})0.1 + \frac{1}{12}(3)(0.2)^2\,\alpha_{AB}$$

$$+\,5(0.2\,\alpha_{AB})0.2 - 5(0.075)^2\,\alpha_C$$

$$(1.3)g - 0.3Q = 0.24\alpha_{AB} - 0.028125\alpha_C$$

Substituting for α_{AB} and Q from (2) and (1):

$$1.3g - 0.3(0.28125\alpha_C) = 0.24\left(\frac{1}{2}\,\alpha_C\right) - 0.028125\,\alpha_C$$

$$1.3g = 0.17625\,\alpha_C \qquad \alpha_C = 7.3759(9.81)$$

$$\alpha_C = 72.36$$

$\boldsymbol{\alpha}_C = 72.4\ \text{rad/s}^2 \circlearrowright$ ◀

(*b*) $a_B = 0.2\alpha_{AB} = 0.2\left(\frac{1}{2}\,\alpha_C\right) = 0.1\alpha_C = 0.1(72.36)$

$\mathbf{a}_B = 7.24\ \text{m/s}^2 \downarrow$ ◀

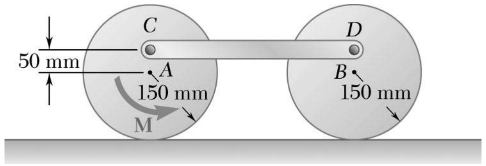
PROBLEM 16.109



Two uniform disks A and B, each of mass of 2 kg, are connected by a 1.5 kg rod CD as shown. A counterclockwise couple **M** of moment 2.5 N-m is applied to disk A. Knowing that the disks roll without sliding, determine (a) the acceleration of the center of each disk, (b) the horizontal component of the force exerted on disk B by pin D.

SOLUTION

Geometry: $r = 150 \text{ mm} = 0.15 \text{ m}$

$b = \overline{AC} = \overline{BD} = 50 \text{ mm} = 0.05 \text{ m}$

$r + b = 0.20 \text{ m}$

Masses: $m_A = m_B = m = 2 \text{ kg} \qquad m_{CD} = 1.5 \text{ kg}$

Moment of inertia: $I_A = I_B = I = \dfrac{1}{2}mr^2$

Kinematics: $\alpha_{CD} = 0$

$\mathbf{a}_A = \mathbf{a}_B = \mathbf{a} = a \longleftarrow$

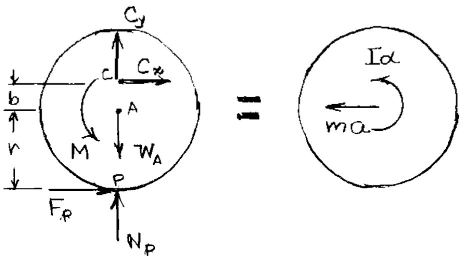
Angular accelerations of disks: $\alpha = \dfrac{a}{r} \circlearrowleft$

$\mathbf{a}_C = \mathbf{a}_A + b\alpha \longleftarrow + b\omega^2 \downarrow$

$\mathbf{a}_D = \mathbf{a}_B + b\alpha \longleftarrow + b\omega^2 \downarrow$

For rod CD, $\bar{a} = (a + b\alpha) \longleftarrow + b\omega^2 \downarrow$

$= \left(1 + \dfrac{b}{r}\right)a \longleftarrow + b\omega^2 \downarrow$

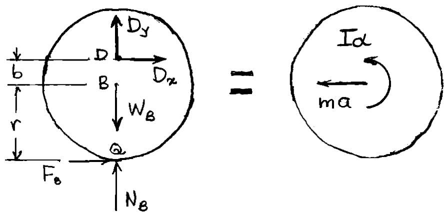


Kinetics:

Disk A: $+\circlearrowleft \Sigma M_P = \Sigma(M_P)_{\text{eff}}: \quad M - (r+b)C_x = mar + I\alpha$

$$= \left(mr + \frac{I}{r}\right)(a) \qquad (1)$$

Disk B: $+\circlearrowleft \Sigma M_Q = \Sigma(M_Q)_{\text{eff}}: \quad -(r+b)D_x = mar + I\alpha$



$$= \left(mr + \frac{I}{r}\right)a \qquad (2)$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. PROBLEM 16.109 (Continued)

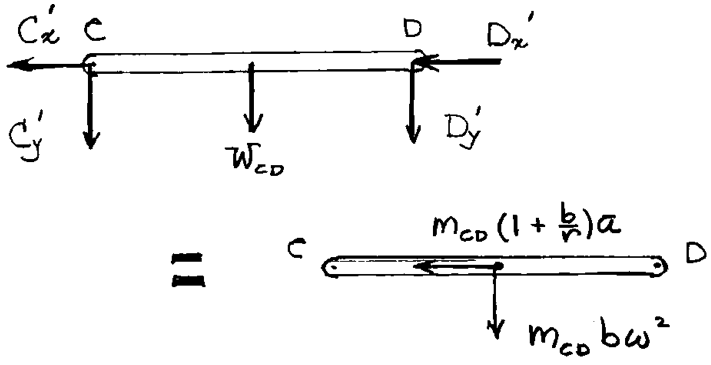
Rod *CD*: $\overset{+}{\leftarrow} \Sigma F_x = \Sigma (F_x)_{\text{eff}}: \quad C_x + D_x = m_{CD}\left(1+\dfrac{b}{r}\right)a$



Multiply by $(r+b)$

$$(r+b)(C_x + D_x) = m_{CD} r\left(1+\frac{b}{r}\right)^2 a \qquad (3)$$

Add Eqs. (1), (2), and (3) to eliminate C_x and D_x

$$M = 2\left(mr + \frac{I}{r}\right)a + m_{CD} r\left(1+\frac{b}{r}\right)^2 a$$

Apply the numerical data. $mr + \dfrac{I}{r} = (2\text{ kg})(0.15\text{ m}) + \dfrac{1}{2}(2\text{ kg})\dfrac{(0.15\text{ m})^2}{0.15\text{ m}} = 0.45\text{ kg}\cdot\text{m}$

$$m_{CD} r\left(1+\frac{b}{r}\right)^2 = (1.5\text{ kg})(0.15\text{ m})\left(1+\frac{0.05}{0.15}\right)^{-2} = 0.40\text{ kg}\cdot\text{m}$$

$$2.5\text{ N}\cdot\text{m} = 2(0.45\text{ kg}\cdot\text{m})\,a + (0.40\text{ kg}\cdot\text{m})\,a$$

$$a = 1.9231\text{ m/s}^2$$

(*a*) *Acceleration of the center of each disk*:

$$\mathbf{a}_A = \mathbf{a}_B = 1.923\text{ m/s}^2 \longleftarrow \blacktriangleleft$$

(*b*) *Horizontal component of the force exerted on disk B by pin D*.

From Eq. (2), $D_x = -\dfrac{1}{r+b}\left(mr + \dfrac{I}{r}\right)a$

$$= -\frac{1}{0.20\text{ m}}(0.45\text{ kg}\cdot\text{m})(1.9231\text{ m/s}^2) = -4.33\text{ N}$$

$$\mathbf{D}_x = 4.33\text{ N} \longleftarrow \blacktriangleleft$$

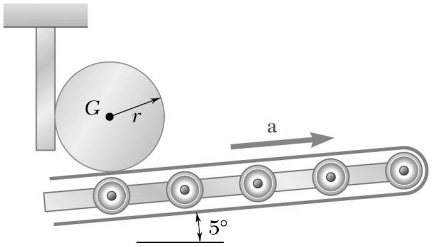
PROBLEM 16.110



A 10-lb cylinder of radius $r = 4$ in. is resting on a conveyor belt when the belt is suddenly turned on and it experiences an acceleration of magnitude $a = 6\text{ft/s}^2$. The smooth vertical bar holds the cylinder in place when the belt is not moving. Knowing the cylinder rolls without slipping and the friction between the vertical bar and the cylinder is negligible, determine (*a*) the angular acceleration of the cylinder, (*b*) the components of the force the conveyor belt applies to the cylinder.

SOLUTION

Mass and moment of inertia.

$$m = \frac{W}{g} = \frac{10\text{ lb}}{32.2\text{ ft/s}^2} = 0.31056\text{ lb}\cdot\text{s}^2/\text{ft}$$

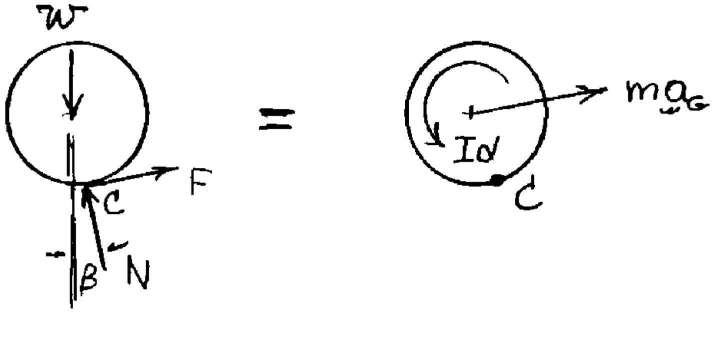
$$I = \frac{1}{2}mr^2 = \frac{1}{2}(0.31056\text{ lb}\cdot\text{s}^2/\text{ft})\left(\frac{4}{12}\text{ ft}\right)^2 = 0.017253\text{ lb}\cdot\text{s}^2\cdot\text{ft}$$

Kinematics: The cylinder rolls without slipping on the belt which is accelerating at $6\text{ ft/s}^2 \measuredangle 5°$.

$$\mathbf{a}_G = (6\text{ ft/s}^2 - r\alpha) \measuredangle 5° = \left[6\text{ ft/s}^2 - \left(\frac{4}{12}\text{ ft}\right)\alpha\right] \measuredangle 5°$$

where $\boldsymbol{\alpha} = \alpha \circlearrowright$ is the angular acceleration of the cylinder.

Kinetics: Let Point C be the contact point between the belt and the cylinder.



$$+\circlearrowright \Sigma M_C = \Sigma(M_C)_{\text{eff}}: \quad Wr\sin\beta = -rma_G + I\alpha$$

$$(10\text{ lb})\left(\frac{4}{12}\text{ ft}\right)\sin 5° = -\left(\frac{4}{12}\text{ ft}\right)(0.31056\text{ lb}\cdot\text{s}^2/\text{ft})\left[6\text{ ft/s}^2 - \left(\frac{4}{12}\text{ft}\right)\alpha\right] + (0.017253\text{ lb}\cdot\text{s}^2\text{ft})\alpha$$

$$0.29052\text{ lb}\cdot\text{ft} = -0.62112\text{ lb}\cdot\text{ft} + (0.051760\text{ lb}\cdot\text{s}^2\cdot\text{ft})\alpha$$

PROBLEM 16.110 (Continued)

(*a*) *Angular acceleration.*

$$\alpha = 17.613 \text{ rad/s}^2 \qquad \boldsymbol{\alpha} = 17.61 \text{ rad/s}^2 \circlearrowleft \blacktriangleleft$$

$$a_G = 6 \text{ ft/s}^2 - \left(\frac{4}{12}\text{ ft}\right)(17.613 \text{ rad/s}^2) = 0.129 \text{ ft/s}^2$$

(*b*) *Components of contact force:*

$$\measuredangle 5^\circ\ \Sigma F = \Sigma(F_{\text{eff}}): \quad F - W\sin 5^\circ = ma_G$$

$$F = W\sin 5^\circ + ma_G = (10 \text{ lb})\sin 5^\circ + (0.31056 \text{ lb}\cdot\text{s}^2/\text{ft})(0.129 \text{ ft/s}^2)$$

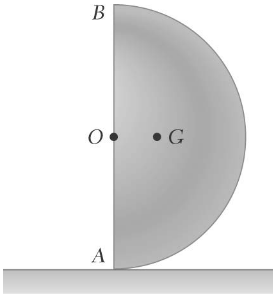
$$\mathbf{F} = 0.912 \text{ lb} \measuredangle 5^\circ \blacktriangleleft$$

$$+\searrow 85^\circ\ \Sigma F = \Sigma F = \Sigma F_{\text{eff}}: \quad N - W\cos 5^\circ = 0$$

$$N = W\cos 5^\circ = (10 \text{ lb})\cos 5^\circ$$

$$\mathbf{N} = 9.96 \text{ lb} \searrow 85^\circ \blacktriangleleft$$

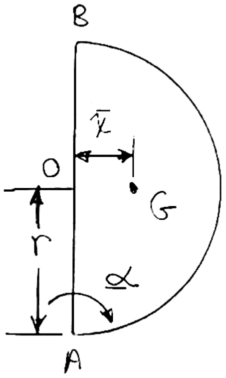
PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



PROBLEM 16.111

A hemisphere of weight W and radius r is released from rest in the position shown. Determine (*a*) the minimum value of μ_s for which the hemisphere starts to roll without sliding, (*b*) the corresponding acceleration of Point B. [*Hint*: Note that $OG = \frac{3}{8}r$ and that, by the parallel-axis theorem, $\bar{I} = \frac{2}{5}mr^2 - m(OG)^2$.]

SOLUTION



Kinematics: $\omega = 0$

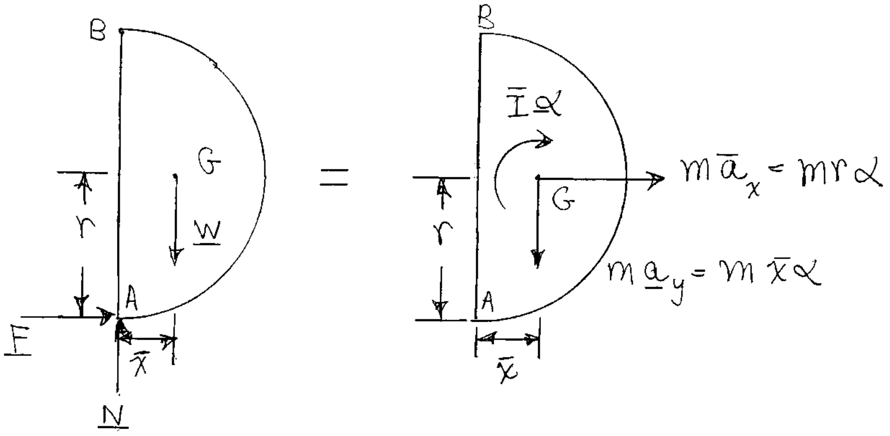
$$\mathbf{a}_O = \mathbf{a}_A + \mathbf{a}_{O/A} = 0 + [r\alpha \longrightarrow]$$

$$\bar{\mathbf{a}} = \mathbf{a}_G = \mathbf{a}_O + \mathbf{a}_{G/O}$$

$$= [r\alpha \longrightarrow] + [\bar{x}\alpha \downarrow]$$

Thus, $\bar{\mathbf{a}}_x = r\alpha \longrightarrow, \qquad \bar{\mathbf{a}}_y = \bar{x}\alpha \downarrow$ (1)

Kinetics:



$$+\circlearrowright \Sigma M_A = \Sigma(M_A)_{\text{eff}}: \quad W\bar{x} = (m\bar{a}_x)r + (m\bar{a}_y)\,\bar{x} + \bar{I}\alpha$$

$$mg\bar{x} = (mr\alpha)\,r + (m\bar{x}\alpha)\,\bar{x} + m\bar{k}^2\alpha$$

$$\alpha = \frac{g\bar{x}}{r^2 + \bar{x}^2 + \bar{k}^2} \qquad (2)$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

$$\xrightarrow{+} \Sigma F_x = \Sigma (F_x)_{\text{eff}}: \quad F = ma_x \qquad F = mr\alpha$$

$$+\uparrow \Sigma F_y = \Sigma (F_y)_{\text{eff}}: \quad N - W = -m\bar{a}_y \qquad N = mg - m\bar{x}\alpha$$

$$\mu_{\min} = \frac{F}{N} = \frac{mr\alpha}{mg - \bar{x}\alpha} \qquad \mu_{\min} = \frac{r\alpha}{g - \bar{x}\alpha} \tag{3}$$

For a hemisphere:

$$\bar{x} = OG = \frac{3}{8}r \qquad \bar{I} = I_O - m\bar{x}^2 = \frac{2}{5}mr^2 - m\left(\frac{3}{8}r\right)^2$$

$$\bar{I} = \frac{2}{5}mr^2 - \frac{9}{64}mr^2 \qquad \bar{k}^2 = \frac{\bar{I}}{m} = \left(\frac{2}{5} - \frac{9}{64}\right)r^2$$

Substituting into (2)

$$\alpha = \frac{g\left(\frac{3}{8}r\right)}{r^2 + \frac{9}{64}r^2 + \left(\frac{2}{5} - \frac{9}{64}\right)r^2} = \frac{\frac{3}{8}}{\frac{7}{5}}\frac{g}{r} \qquad \alpha = \frac{15}{56}\frac{g}{r}$$

(*a*) Substituting into (3)

$$\mu_{\min} = \frac{\frac{15}{56}}{1 - \left(\frac{3}{8}\right)\left(\frac{15}{56}\right)} = \frac{0.26786}{0.89955}$$

$\mu_{\min} = 0.298$ ◀

(*b*) $$a_B = (2r)\,\alpha = (2r)\left(\frac{15g}{56r}\right) = \frac{30g}{56}$$

$\mathbf{a}_B = 0.536g \longrightarrow$ ◀

Note: In this problem we *cannot* use the equation $\Sigma M_A = I_A\,\alpha$, since Points *A*, *O*, and *G* are not aligned.

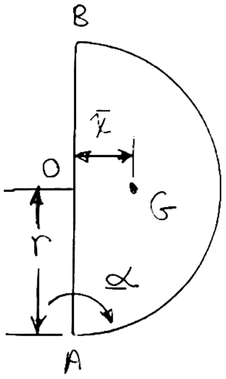
PROBLEM 16.112

Solve Problem 16.111, considering a half cylinder instead of a hemisphere. [*Hint*. Note that $OG = 4r/3\pi$ and that, by the parallel-axis theorem, $\bar{I} = \frac{1}{2}mr^2 - m(OG)^2$.]

SOLUTION



Kinematics: $\omega = 0$

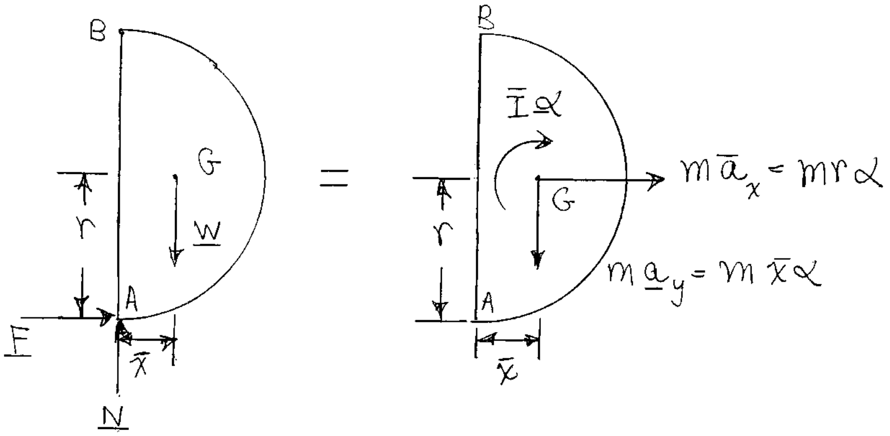
$$\mathbf{a}_O = \mathbf{a}_A + \mathbf{a}_{O/A} = 0 + [r\alpha \longrightarrow]$$

$$\bar{\mathbf{a}} = \mathbf{a}_G = \mathbf{a}_O + \mathbf{a}_{G/O}$$

$$= [r\alpha \longrightarrow] + [\bar{x}\alpha \downarrow]$$

Thus, $\mathbf{a}_x = r\alpha \longrightarrow, \qquad \mathbf{a}_y = \bar{x}\alpha \downarrow$ (1)

Kinetics:



$$+\circlearrowright \Sigma M_A = \Sigma(M_A)_{\text{eff}}: \quad W\bar{x} = (m\bar{a}_x)r + (m\bar{a}_y)\,\bar{x} + \bar{I}\alpha$$

$$mg\bar{x} = (mr\alpha)\,r + (m\bar{x}\alpha)\,\bar{x} + m\bar{k}^2\,\alpha$$

$$\alpha = \frac{g\bar{x}}{r^2 + \bar{x}^2 + \bar{k}^2} \qquad (2)$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

$$\xrightarrow{+} \Sigma F_x = \Sigma (F_x)_{\text{eff}}: \qquad F = ma_x \qquad F = mr\alpha$$

$$+\uparrow \Sigma F_y = \Sigma (F_y)_{\text{eff}}: \qquad N - W = -m\bar{a}_y \qquad N = mg - m\bar{x}\alpha$$

$$\mu_{\min} = \frac{F}{N} = \frac{mr\alpha}{mg - \bar{x}\alpha} \qquad \mu_{\min} = \frac{r\alpha}{g - \bar{x}\alpha} \tag{3}$$

For a half cylinder:

$$\bar{x} = OG = \frac{4r}{3\pi} \qquad \bar{I} = I_O - m\bar{x}^2 = \frac{1}{2}mr^2 - m\left(\frac{4r}{3\pi}\right)^2$$

$$\bar{k}^2 = \frac{\bar{I}}{m} = \frac{1}{2}r^2 - \left(\frac{4r}{3\pi}\right)^2$$

Substituting into (2):

$$\alpha = \frac{g\left(\frac{4r}{3\pi}\right)}{r^2 + \left(\frac{4r}{3\pi}\right)^2 + \frac{1}{2}r^2 - \left(\frac{4r}{3\pi}\right)^2} = \frac{\frac{4}{3\pi}}{\frac{3}{2}}\frac{g}{r} \qquad \alpha = \frac{8}{9\pi}\frac{g}{r}$$

(*a*) Substituting into (3):

$$\mu_{\min} = \frac{\frac{8}{9\pi}}{1 - \left(\frac{4}{3\pi}\right)\left(\frac{8}{9\pi}\right)} = \frac{0.28294}{0.87992} \qquad \mu_{\min} = 0.322 \blacktriangleleft$$

(*b*) $a_B = (2r)\,\alpha = (2r)\left(\dfrac{8g}{9\pi r}\right) = \dfrac{16g}{9\pi}$ $\qquad a_B = 0.566g \blacktriangleleft$

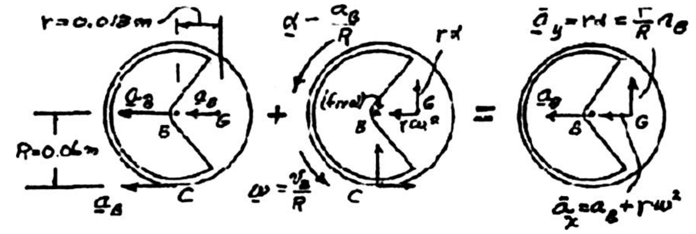
PROBLEM 16.113

The center of gravity G of a 1.5-kg unbalanced tracking wheel is located at a distance $r = 18$ mm from its geometric center B. The radius of the wheel is $R = 60$ mm and its centroidal radius of gyration is 44 mm. At the instant shown the center B of the wheel has a velocity of 0.35 m/s and an acceleration of 1.2 m/s^2, both directed to the left. Knowing that the wheel rolls without sliding and neglecting the mass of the driving yoke AB, determine the horizontal force **P** applied to the yoke.

SOLUTION

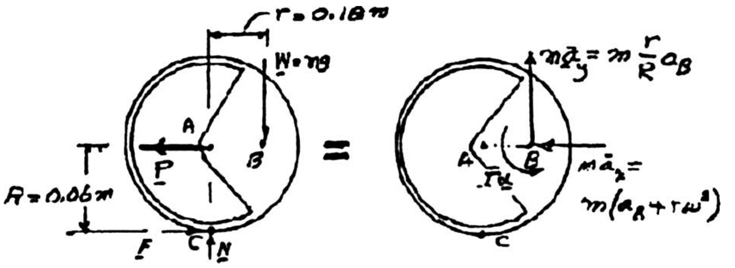
Kinematics: Choose positive $\mathbf{v}_B$ and $\mathbf{a}_B$ to left.



Trans. with B + Rotation about B = Rolling motion

$$\bar{\mathbf{a}} = [a_B + r\omega^2] \longleftarrow + \left[\frac{r}{R}a_B\right]\uparrow$$

Kinetics:



$$+\circlearrowleft \Sigma M_C = \Sigma(M_C)_{\text{eff}}: \quad PR - Wr = (m\bar{a}_y)r + (m\bar{a}_x)R + \bar{I}\alpha$$

$$PR - mgr = m\left(\frac{r}{R}a_B\right)r + m(a_B + r\omega^2)R + m\bar{k}^2\frac{a_B}{R}$$

$$= ma_B\left(\frac{r^2}{R} + R + \frac{\bar{k}^2}{R}\right) + mr\left(\frac{v_B}{r}\right)^2 R$$

$$P = mg\left(\frac{r}{R}\right) + ma_B\left(1 + \frac{r^2 + \bar{k}^2}{R^2}\right) + m\frac{r}{R^2}v_B^2 \qquad (1)$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 16.113 (Continued)

Substitute:

$$m = 1.5 \text{ kg}$$
$$r = 0.018 \text{ m}$$
$$R = 0.06 \text{ m}$$
$$\bar{k} = 0.044 \text{ mm} \quad \text{and} \quad g = 9.81 \text{ m/s}^2 \text{ in Eq. (1)}$$

$$P = 1.5(9.81)\frac{0.018}{0.06} + 1.5(a_B)\left(1 + \frac{0.018^2 + 0.044^2}{0.06^2}\right) + 1.5\frac{0.018}{0.06^2}v_B^2$$

$$P = 4.4145 + 2.4417a_B + 7.5v_B^2 \qquad (2)$$

Data: $\mathbf{v}_B = 0.35 \text{ m/s} \longleftarrow; \quad v_B = +0.35 \text{ m/s}$

$\mathbf{a}_B = 1.2 \text{ m/s}^2 \longleftarrow; \quad a_B = +1.2 \text{ m/s}^2$

Substitute in Eq. (2):

$$P = 4.4145 + 2.4417(+1.2) + 7.5(+0.35)^2$$
$$= 4.4145 + 2.9300 + 0.9188$$
$$= +8.263 \text{ N}$$

$\mathbf{P} = 8.26 \text{ N} \longleftarrow$ ◀

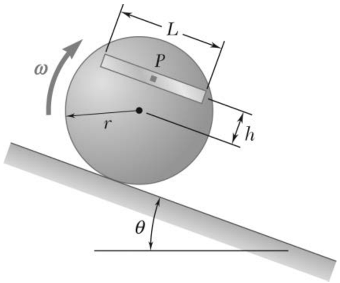
PROBLEM 16.116



A 4-lb bar is attached to a 10-lb uniform cylinder by a square pin, P, as shown. Knowing that $r = 16$ in., $h = 8$ in., $\theta = 20°$, $L = 20$ in. and $\omega = 2$ rad/s at the instant shown, determine the reactions at P at this instant assuming that the cylinder rolls without sliding down the incline.

SOLUTION

Masses and moments of inertia.

Bar: $m_B = \dfrac{W_B}{g} = \dfrac{4\text{lb}}{32.2} = 0.12422$ slug

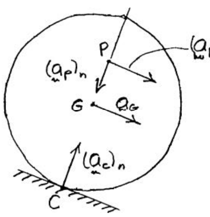
$$\bar{I}_B = \frac{1}{12} m_B L^2 = \frac{1}{12}\left(\frac{4 \text{ lb}}{32.2}\right)\left(\frac{20 \text{ in.}}{12}\right)^2 = 0.028755 \text{ slug} \cdot \text{ft}^2$$

Disk: $m_D = \dfrac{W_D}{g} = \dfrac{10 \text{ lb}}{32.2} = 0.31056$ slug

$$\bar{I}_D = \frac{1}{2} m_C r^2 = \frac{1}{2}\left(\frac{10 \text{ lb}}{32.2}\right)\left(\frac{16 \text{ in}}{12}\right)^2 = 0.27605 \text{ slug} \cdot \text{ft}^2$$

Kinematics. Let Point C be the point of contact between the cylinder and the incline and Point G be the mass center of the cylinder without the bar. Assume that the mass center of the bar lies at Point P.

$$\boldsymbol{\alpha} = \alpha \circlearrowright. \quad \mathbf{a}_G = a_G \measuredangle 20°$$



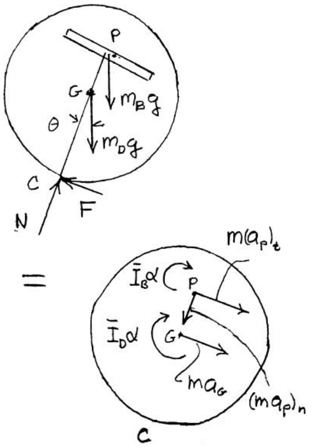
For rolling without slipping, $(a_C)_t = a_G - r\alpha = 0 \quad a_G = r\alpha$

$$(a_P)_t = a_G + h\alpha$$

$$(a_P)_t = (r+h)\alpha$$

$$(a_P)_h = 0 + h\omega^2 = h\omega^2$$

Kinetics: Using the cylinder plus the bar as a free body,



$$+\circlearrowright \Sigma M_C = +\Sigma(M_C)_{\text{eff}}: \quad m_D g r \sin\theta + m_B g(r+h)\sin\theta$$

$$= \bar{I}_D\alpha + m_D a_G r + \bar{I}_B \alpha + m_B (a_P)_t (r+h)$$

$$= [\bar{I}_D + m_D r^2 + \bar{I}_B + m_B (r+h)^2]\alpha$$

$$\alpha = \frac{[m_D g r + m_B g(r+h)]\sin\theta}{\bar{I}_D + m_D r^2 + \bar{I}_B + m_B (r+h)^2}$$

$$= \frac{\left[(10)\left(\frac{16}{12}\right) + (4)\left(\frac{24}{12}\right)\right]\sin 20°}{0.27605 + \left(\frac{10}{32.2}\right)\left(\frac{16}{12}\right)^2 + (0.028755) + \left(\frac{4}{32.2}\right)\left(\frac{24}{12}\right)^2}$$

$$= 5.3896 \text{ rad/s}^2$$

$$(a_P)_t = \left(\tfrac{24}{12}\right)(5.3896) = 10.7791 \text{ ft/s}^2$$

$$(a_P)_n = \left(\tfrac{8}{12}\right)(2)^2 = 2.6667 \text{ ft/s}^2$$

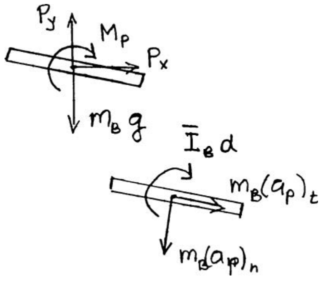
PROBLEM 16.116 (Continued)

Using the bar alone as a free body,



$$\xrightarrow{+} \Sigma F_x = \Sigma (F_x)_{\text{eff}}: \quad P_x = m_B (a_P)_t \cos 20° - m_B (a_P)_n \sin 20°$$

$$= \left(\frac{4}{32.2}\right)(10.779)\cos 20° - \left(\frac{4}{32.2}\right)(2.6667)\sin 20°$$

$$P_x = 1.1450 \text{ lb}$$

$$+\uparrow \Sigma F_y = \Sigma (F_y)_{\text{eff}}: \quad P_y - m_B g = -m_B (a_P)_t \sin 20° - m_B (a_P)_n \cos 20°$$

$$P_y = (4) - \left(\frac{4}{32.2}\right)(10.779)\sin 20° - \left(\frac{4}{32.2}\right)(2.6667)\cos 20°$$

$$P_y = 3.2307 \text{ lb}$$

$$P = \sqrt{1.145^2 + 3.2307^2} = 3.4276 \text{ lb}$$

$$\tan \beta = \frac{3.2307}{1.145}$$

$$\beta = 70.5°$$

$\mathbf{P} = 3.43 \text{ lb} \measuredangle 70.5°$ ◀

Recognizing that P is the CG of the bar.

$$+\circlearrowright \Sigma M_P = \Sigma (M_P)_{\text{eff}}: \quad M_P = \bar{I}_B \alpha$$

$$= (0.028755)(5.3896)$$

$\mathbf{M}_P = 0.1550 \text{ ft} \cdot \text{lb} \circlearrowright$ ◀

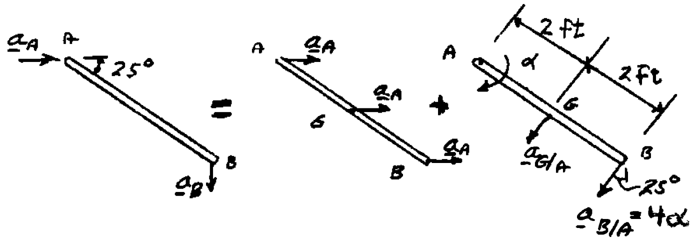
PROBLEM 16.117

The ends of the 20-lb uniform rod AB are attached to collars of negligible mass that slide without friction along fixed rods. If the rod is released from rest when $\theta = 25°$, determine immediately after release (*a*) the angular acceleration of the rod, (*b*) the reaction at A, (*c*) the reaction at B.

SOLUTION

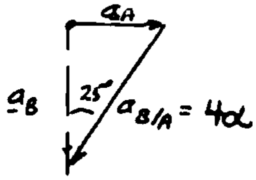
<u>Kinematics</u>: Assume $\alpha \circlearrowright$ $\qquad \omega = 0$



$$\mathbf{a}_B \downarrow = \mathbf{a}_A + \mathbf{a}_{B/A} = [a_A \rightarrow] + [4\alpha \measuredangle 25°]$$

$$a_B = (4\alpha)\cos 25° = 3.6252\alpha$$

$$a_A = (4\alpha)\sin 25° = 1.6905\alpha$$



$$\mathbf{a}_G = \mathbf{a}_A + \mathbf{a}_{G/A} = [a_A \rightarrow] + [2\alpha \measuredangle 25°]$$

$$\mathbf{a}_G = [1.6905\alpha \rightarrow] + [2\alpha \measuredangle 25°]$$

$$\bar{a}_x = (a_G)_x = [1.6905\alpha \rightarrow] + [0.84524\alpha \leftarrow]$$

$$\bar{\mathbf{a}}_x = 0.84524\alpha \rightarrow$$

$$\bar{a}_y = [2\alpha \cos 25° \downarrow] = 1.8126\alpha \downarrow$$

We have found for $\alpha \circlearrowright$

$$\bar{\mathbf{a}}_x = 0.84524\alpha \rightarrow$$

$$\bar{\mathbf{a}}_y = 1.8126\alpha \downarrow$$

<u>Kinetics</u>:

$$\bar{I} = \frac{1}{12}mL^2 = \frac{1}{12}m(4\text{ ft})^2$$

PROBLEM 16.121

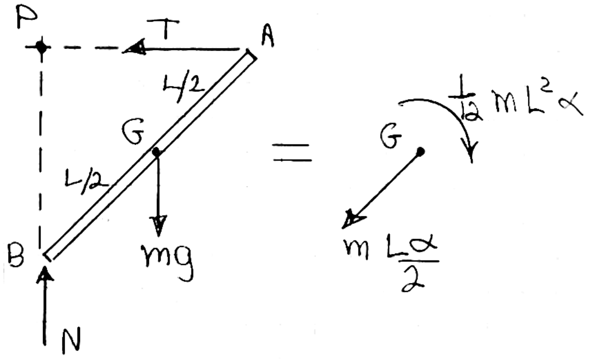
End A of a uniform 10-kg bar is attached to a horizontal rope and end B contacts a floor with negligible friction. Knowing that the bar is released from rest in the position shown, determine immediately after release (a) the angular acceleration of the bar, (b) the tension in the rope, (c) the reaction at B.

SOLUTION

Kinematics: $\boldsymbol{\alpha} = \alpha \circlearrowright$

$$[a_B \leftarrow] = [a_A \downarrow] + [L\alpha \searrow 45°] \qquad \mathbf{a}_A = 0.7071\,L\alpha \downarrow$$

$$\mathbf{a}_G = \mathbf{a}_A + \left[\frac{L\alpha}{2} \searrow 45°\right] = [0.7071\,\alpha \downarrow] + \left[\frac{L\alpha}{2} \searrow 45°\right] = \frac{L\alpha}{2} \swarrow 45°$$



$$+\circlearrowright \Sigma M_P = \cancel{m} g \frac{L}{2}(0.7071)$$

$$= \frac{1}{12} \cancel{m} L^2 \alpha + \cancel{m} \frac{L}{2} \alpha \left(\frac{L}{2}\right)$$

$$\alpha = 0.7071\left(\frac{3g}{2L}\right)$$

$$g = 9.81 \text{ m/s}^2, \qquad L = 1 \text{ m},$$

(a) $\boldsymbol{\alpha} = 10.405 \text{ rad/s}^2 \circlearrowright$ ◀

$$\overset{+}{\leftarrow} \Sigma F_x = T = \frac{mL\alpha}{2}(0.7071) = \frac{m\cancel{L}(0.5)}{2}\left(\frac{3g}{\cancel{L}}\right) = \frac{3}{8} mg = 36.788 \text{ N}$$

(b) $T = 36.8 \text{ N}$ ◀

$$+\uparrow \Sigma F_y = N - mg = -\frac{3}{8} mg, \qquad N = \frac{5}{8} mg = 61.313 \text{ N}$$

(c) $N = 61.3 \text{ N} \uparrow$ ◀

Alternate solution:

Kinematics (realizing that the rope constrains Point A to the $\mathbf{j}$-direction at the instant shown):

$$a_A\mathbf{j} = a_B\mathbf{i} + \alpha\mathbf{k}\, x(L\cos 45°\mathbf{i} + L\sin 45°\mathbf{j})$$

$$= a_B\mathbf{i} + (L\cos 45°)\alpha\mathbf{j} - (L\sin 45°)\alpha\mathbf{i}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 16.121 (Continued)

x-components

$$0 = a_B - (L\sin 45°)\alpha$$

$$a_B = (L\sin 45°)\alpha$$

y-components

$$a_A = (L\cos 45°)\alpha$$

Acceleration of CG

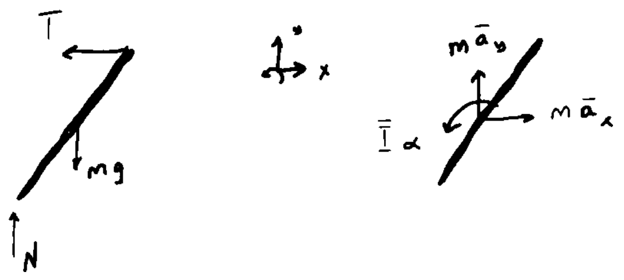
$$\mathbf{a}_G = \mathbf{a}_B + \boldsymbol{\alpha} \times \mathbf{r}_{G/B} - \omega^2 \mathbf{r}_{G/B} = \mathbf{a}_B - \boldsymbol{\alpha} \times \mathbf{r}_{G/B}$$

$$a_G = (L\sin 45°)\alpha\mathbf{i} + \alpha\mathbf{k} \times \left(\frac{L}{2}\cos(45°)\mathbf{i} + \frac{L}{2}\sin(45°)\mathbf{j}\right)$$

$$= (L\sin 45)\alpha\mathbf{i} + \left(\frac{L}{2}\cos(45°)\alpha\mathbf{j} - \frac{L}{2}\sin(45°)\alpha\mathbf{i}\right)$$

$$a_G = \frac{L}{2}\sin 45°\alpha\,\mathbf{i} + \frac{L}{2}\cos 45°\alpha\mathbf{j}$$

Kinetics:



Equations of motion:

$$\Sigma F_x = m\bar{a}_x$$

$$-T = m\left(\frac{L}{2}\sin 45°\right)\alpha \qquad (1)$$

$$\Sigma F_y = m\bar{a}_y$$

$$N - mg = m\left(\frac{L}{2}\cos 45°\right)\alpha$$

$$N = mg + m\left(\frac{L}{2}\cos 45\right)\alpha \qquad (2)$$

$$\Sigma M_G = \bar{T}\alpha$$

$$T\left(\frac{L}{2}\right)\sin 45° - N\left(\frac{L}{2}\cos 45°\right) = \frac{1}{12}mL^2\alpha \qquad (3)$$

Solving the three simultaneous equations gives the same results as above.

PROBLEM 16.123

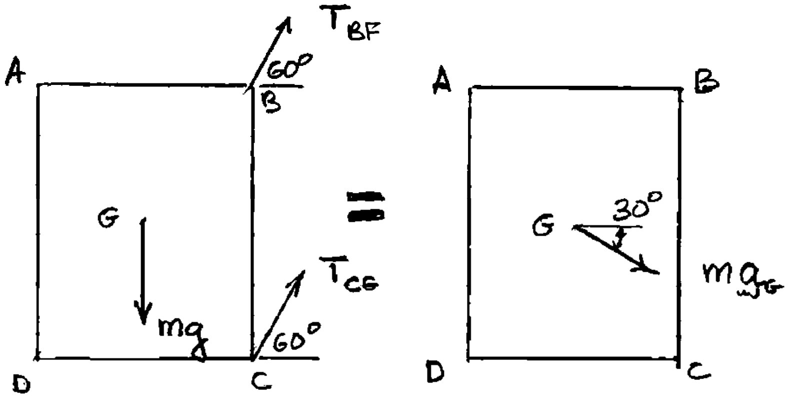
A uniform thin plate *ABCD* has a mass of 8 kg and is held in position by three inextensible cords *AE*, *BF*, and *CG*. If cord *AE* is cut, determine at that instant (*a*) if the plate is undergoing translation or general plane motion, (*b*) the tension in cords *BF* and *CG*.

SOLUTION

Immediately after cord *AE* breaks, $\omega = 0$.

(*a*) Assume that the cords *BF* and *CG* constrain the plate to undergo curvilinear translation, making $\boldsymbol{\alpha} = 0$.

$$\mathbf{a}_G = \bar{a} \searrow 30°$$



$$+\searrow 30° \Sigma F = \Sigma F_{\text{eff}}: \quad mg \sin 30° = ma_G$$

$$a_G = g \sin 30°$$

$$+\circlearrowleft \Sigma M_B = \Sigma (M_B)_{\text{eff}}: \quad 0.075mg + 0.200T_{CG} \cos 60° = mg \sin 30°(0.100 + 0.075 \sin 30°)$$

$$0.100T_{CG} = -0.00625mg \qquad T_{CG} = -0.0625mg$$

Since T_C is negative, the cord becomes slack so that the plate undergoes general plane motion with $T_{CG} = 0$.

general plane motion ◀

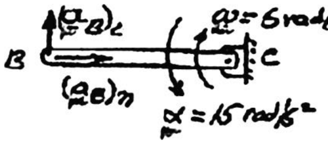
PROBLEM 16.124

The 4-kg uniform rod ABD is attached to the crank BC and is fitted with a small wheel that can roll without friction along a vertical slot. Knowing that at the instant shown crank BC rotates with an angular velocity of 6 rad/s clockwise and an angular acceleration of 15 rad/s^2 counterclockwise, determine the reaction at A.

SOLUTION

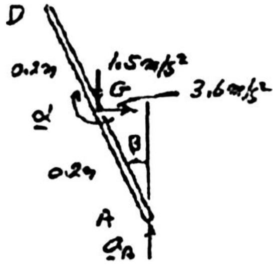


Crank BC:

$$BC = 0.1 \text{ m}$$

$$(a_B)_t = (BC)\alpha = (0.1 \text{ m})(15 \text{ rad/s}^2) = 1.5 \text{ m/s}^2 \qquad (\mathbf{a}_B)_t = 1.5 \text{ rad/s}^2 \downarrow$$

$$(a_B)_n = (BC)\omega^2 = (0.1 \text{ m})(6 \text{ rad/s})^2 = 3.6 \text{ m/s}^2 \qquad (\mathbf{a}_B)_n = 3.6 \text{ m/s}^2 \longrightarrow$$



Rod ABD:

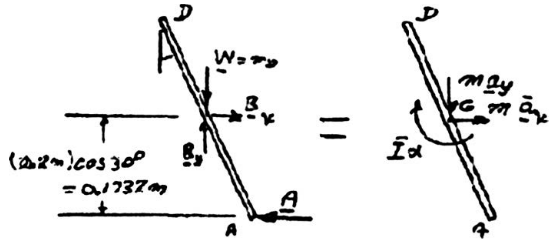
$$\theta = \sin^{-1}\frac{BC}{AB} = \sin^{-1}\frac{0.1 \text{ m}}{0.2 \text{ m}} = 30^\circ$$

$$\mathbf{a}_A = \mathbf{a}_B + \mathbf{a}_{A/G}$$

$$[a_A \uparrow] = [1.5 \downarrow + 3.6 \longrightarrow] + [0.2\alpha \nearrow \beta]$$

$$\xrightarrow{+} 0 = 3.6 - (0.2\alpha)\cos\beta$$

$$\alpha = \frac{3.6}{0.2\cos\beta} = \frac{18}{\cos 30^\circ} = 20.78 \text{ rad/s}^2 \qquad \boldsymbol{\alpha} = 20.78 \text{ rad/s}^2 \circlearrowright$$



Kinetics:

$$+\circlearrowright \Sigma M_G = \Sigma(M_G)_{\text{eff}}: \quad A(0.1732 \text{ m}) = I\alpha = \frac{1}{12}mL^2\alpha$$

$$= \frac{1}{12}(4 \text{ kg})(0.4 \text{ m})^2(20.78 \text{ rad/s}^2)$$

$$A = 6.399 \text{ N} \qquad \mathbf{A} = 6.40 \text{ N} \longleftarrow \blacktriangleleft$$

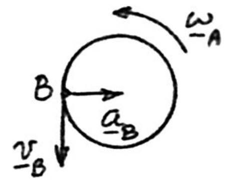
PROBLEM 16.128

Solve Problem 16.127 when $\theta = 90°$.

PROBLEM 16.127 The 250-mm uniform rod *BD*, of mass 5 kg, is connected as shown to disk *A* and to a collar of negligible mass, which may slide freely along a vertical rod. Knowing that disk *A* rotates counterclockwise at a constants rate of 500 rpm, determine the reactions at *D* when $\theta = 0$.

SOLUTION

Kinematics: *For disk A*: $(\alpha_A = 0)$

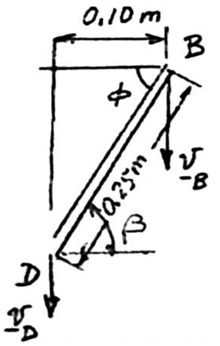


$$\omega_A = 500 \text{ rpm} = 52.36 \text{ rad/s}$$

$$v_B = r\omega_A = (0.05 \text{ m})(52.36 \text{ rad/s})$$
$$= 2.618 \text{ m/s}$$

$$a_B = r\omega_A^2 = (0.05 \text{ m})(52.36 \text{ rad/s})^2$$
$$= 137.08 \text{ m/s}^2$$

For rod (velocities)



Since $\mathbf{v}_D$ is parallel to, $\mathbf{v}_B$

we have $\underline{\omega = 0}$

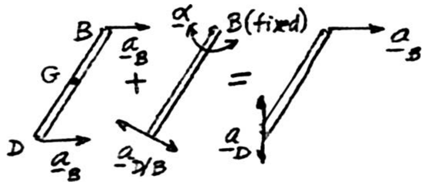
We also note that $\cos\phi = \dfrac{0.10}{0.25}$

$$\phi = 66.42°$$

For rod (accelerations)

$$(a_{D/B})_n = 0$$

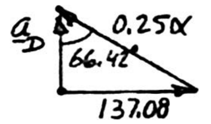
Since $\omega = 0$



$$\mathbf{a}_B + \mathbf{a}_{D/B} = \mathbf{a}_D$$

$$137.08 \rightarrow +0.25\alpha \measuredangle \phi = a_D \uparrow$$

$$(0.25\alpha)\sin 66.42° = 137.08$$



$$\boldsymbol{\alpha} = 598.3 \text{ rad/s}^2 \circlearrowright$$

$$\bar{\mathbf{a}} = \mathbf{a}_G = \mathbf{a}_B + \mathbf{a}_{G/B}$$

$$\xrightarrow{+} \bar{a}_x = 137.08 - 0.125(598.3)\sin 66.42° = +68.54 \text{ m/s}^2$$

$$+\uparrow \bar{a}_y = 0.125(598.3)\cos 66.42° = +29.92 \text{ m/s}^2$$

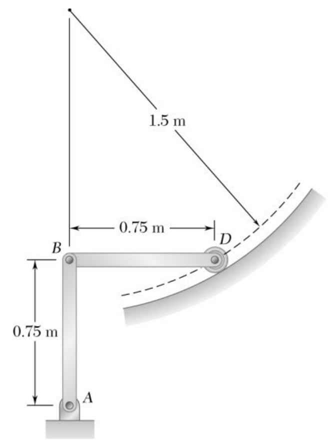
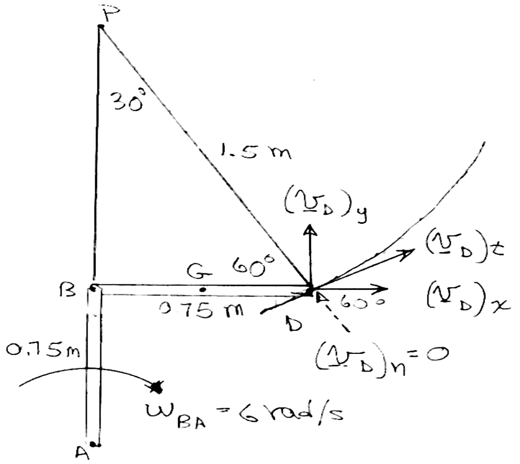
PROBLEM 16.129



The 4-kg uniform slender bar *BD* is attached to bar *AB* and a wheel of negligible mass which rolls on a circular surface. Knowing that at the instant shown bar *AB* has an angular velocity of 6 rad/s and no angular acceleration, determine the reaction at Point *D*.

SOLUTION

Kinematics:



Since $(\mathbf{v}_D)_n = 0$,

$$(v_D)_x \cos 60^\circ = (v_D)_y \cos 30^\circ$$

$$(v_D)_x = (v_B)_x = (AB)\,\omega_{BA} = (0.75 \text{ m})(6 \text{ rad/s})$$

$$(v_D)_y = (v_D)_x \frac{\cos 60^\circ}{\cos 30^\circ}$$

$$= (0.75)(6)\frac{\left(\frac{1}{2}\right)}{\left(\frac{\sqrt{3}}{2}\right)} = \frac{0.75\,(6)}{\sqrt{3}}$$

But

$$(v_D)_y = \omega_{BD}\,(BD)$$

$$\omega_{BD} = \frac{(v_D)_y}{BD} = \frac{0.75\,(6)}{0.75\sqrt{3}} = \frac{6}{\sqrt{3}} \text{ rad/s}$$

$$\mathbf{a}_B = AB\,\omega_{BA}^2 = (0.75 \text{ m})(6 \text{ rad/s})^2 = 27 \text{ m/s}^2 \downarrow$$

$$\mathbf{a}_D = \mathbf{a}_B + \mathbf{a}_{D/B}$$

$$[(\mathbf{a}_D)_t \nearrow 30^\circ] + [(1.5)(6/\sqrt{3})^2 \searrow 60^\circ] = [27 \downarrow] + [0.75\,\alpha_{AB} \uparrow] + [(0.75)(6/\sqrt{3})^2 \longleftarrow]$$

$$60^\circ \searrow: \qquad 0 + 18 = -27\sin 60^\circ + (0.75\sin 60^\circ)\alpha_{BD} + 9\sin 30^\circ$$

$$\alpha_{BD} = \frac{18 + 27\sin 60^\circ - 9\sin 30^\circ}{0.75\sin 60^\circ} = 56.7846 \text{ rad/s}$$

$$\mathbf{a}_G = \mathbf{a}_B + \mathbf{a}_{G/B}$$

$$= [27\downarrow] + [0.375\alpha_{BD}\uparrow] + [(0.375)(6/\sqrt{3})^2 \longleftarrow]$$

$$= [5.7058 \text{ m/s}^2 \downarrow] + [4.5 \text{ m/s}^2 \longleftarrow]$$

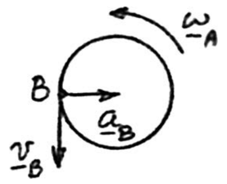
PROBLEM 16.130

The motion of the uniform slender rod of length $L = 0.5$ m and mass $m = 3$ kg is guided by pins at A and B that slide freely in frictionless slots, circular and horizontal, cut into a vertical plate as shown. Knowing that at the instant shown the rod has an angular velocity of 3 rad/s counter-clockwise and $\theta = 30°$, determine the reactions at Points A and B.

SOLUTION

Mass and moment of inertia: $m = 3$ kg

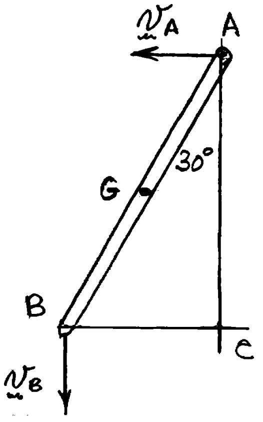


$$\bar{I} = \frac{1}{12}mL^2 = \frac{1}{12}(3\text{ kg})(0.5\text{ m})^2 = 0.0625\text{ kg}\cdot\text{m}^2$$

Kinematics: $\boldsymbol{\omega} = 3\text{ rad/s} \circlearrowleft$

$$\mathbf{v}_A = v_A \leftarrow \qquad \mathbf{v}_B = v_B \downarrow$$

Locate the instantaneous center C by drawing line $\overline{AC}$ perpendicular to $\mathbf{v}_A$ and line $\overline{BC}$ perpendicular to $\mathbf{v}_B$.



$$v_A = (L\cos 30°)\omega = (0.5\text{ m}\cos 30°)(3\text{ rad/s}) = 1.29904\text{ m/s}$$

$$v_B = (L\sin 30°)\omega = (0.5\text{ m}\sin 30°)(3\text{ rad/s}) = 0.75\text{ m/s}$$

$$\alpha = \alpha \circlearrowleft \qquad \mathbf{a}_A = a_A \rightarrow$$

$$\mathbf{a}_B = \frac{v_B^2}{R} \leftarrow + (a_B)_y \uparrow = \frac{(0.75\text{ m/s})^2}{0.3\text{ m}} \leftarrow (a_B)_y \uparrow$$

$$= 1.875\text{ m/s}^2 \leftarrow + (a_B)_y \uparrow$$

$$\mathbf{a}_B = \mathbf{a}_A + \mathbf{a}_{B/A} = \mathbf{a}_A + (\mathbf{a}_{B/A})_t + (\mathbf{a}_{B/A})_n$$

where $(\mathbf{a}_{B/A})_t = L\alpha \nwarrow 30° = 0.5\alpha \nwarrow 30°$

and $(\mathbf{a}_{B/A})_n = L\omega^2 \angle\!\nearrow 60° = (0.5)(3)^2 \angle\!\nearrow 60° = 4.5\text{ m/s}^2 \angle\!\nearrow 60°$

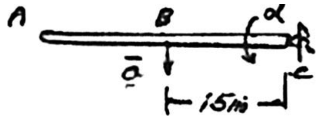
PROBLEM 16.134

Two 8-lb uniform bars are connected to form the linkage shown. Neglecting the effect of friction, determine the reaction at D immediately after the linkage is released from rest in the position shown.

SOLUTION



Kinematics:

Bar AC: Rotation about C

$$\bar{a} = (BC)\alpha = \left(\frac{15}{12}\text{ ft}\right)\alpha$$

$$\bar{\mathbf{a}} = 1.25\alpha \downarrow$$

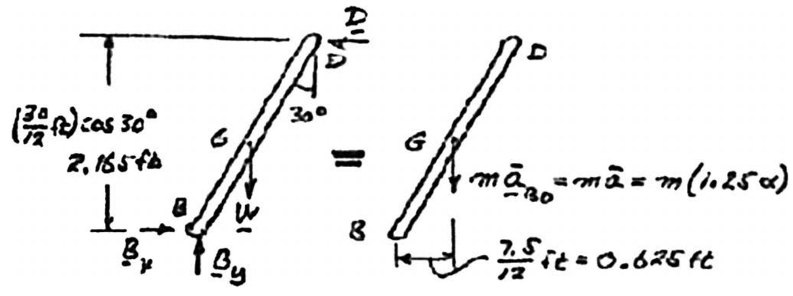
$$\sin\theta = \frac{15\text{ in.}}{30\text{ in.}} \quad \theta = 30°$$

Bar BC: $\mathbf{a}_{D/B} = L\alpha \nwarrow$

Must be zero since $a_D \downarrow$ $\quad \alpha_{BD} = 0$ and $\bar{a}_{BD} = \bar{a}$

Kinetics:

Bar BD



$$+\uparrow \Sigma F_y = \Sigma (F_y)_{\text{eff}}: \quad B_y - W = -m\bar{a}$$

$$B_y - 8\text{ lb} = -\frac{8\text{ lb}}{32.2}(1.25\alpha)$$

$$B_y = 8 - 0.3105\alpha \qquad (1)$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

$$+\circlearrowleft \Sigma M_B = \Sigma (M_B)_{\text{eff}}: \quad D(2.165 \text{ ft}) - W(0.625 \text{ ft}) = -m\bar{a}(0.625 \text{ ft})$$

$$D(2.165 \text{ ft}) - (8 \text{ lb})(0.625 \text{ ft}) = -\frac{8 \text{ lb}}{32.2}(1.25\alpha)(0.625 \text{ ft})$$

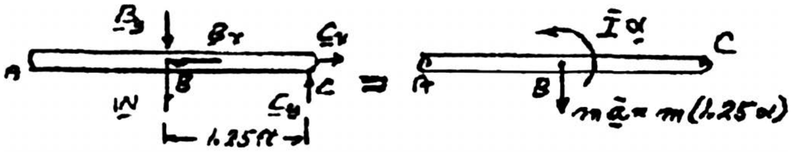
$$D = 2.309 - 0.08965\alpha \qquad (2)$$

Bar AC:

$$\bar{I} = \frac{1}{12} m(AC)^2$$

$$= \frac{1}{12}\frac{8 \text{ lb}}{32.2}(2.5 \text{ ft})^2$$

$$= 0.1294 \text{ lb} \cdot \text{ft} \cdot \text{s}^2$$



$$+\circlearrowleft \Sigma M_C = \Sigma (M_C)_{\text{eff}}: \quad W(1.25 \text{ ft}) + B_y(1.25 \text{ ft}) = \bar{I}\alpha + m(1.25\alpha)(1.25)$$

Substitute from Eq. (1) for B_y

$$8(1.25) + (8 - 0.3105\alpha)(1.25) = (0.1294)\alpha + \frac{8}{32.2}(1.25)^2\alpha$$

$$10 + 10 - 0.3881\alpha = 0.1294\alpha + 0.3882\alpha$$

$$20 = 0.9057\alpha$$

$$\alpha = 22.08 \text{ rad/s}^2$$

Eq. (2),

$$D = 2.309 - 0.08965\alpha$$

$$= 2.309 - 0.08965(22.08)$$

$$= 2.309 - 1.979$$

$$D = 0.330 \text{ lb}$$

$\mathbf{D} = 0.330 \text{ lb} \longleftarrow$ ◀

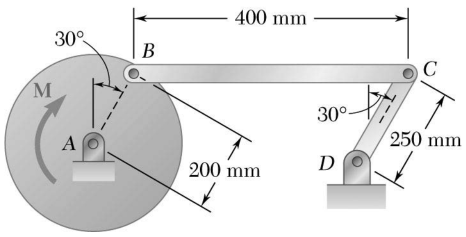
PROBLEM 16.136



The 6-kg rod BC connects a 10-kg disk centered at A to a 5-kg rod CD. The motion of the system is controlled by the couple **M** applied to disk A. Knowing that at the instant shown disk A has an angular velocity of 36 rad/s clockwise and an angular acceleration of 150 rad/s^2 counterclockwise, determine (*a*) the couple **M**, (*b*) the components of the force exerted at C on rod BC.

SOLUTION

<u>Kinematics</u>: *Velocity analysis.* $\boldsymbol{\omega}_{AB} = 36 \text{ rad/s} \circlearrowright$

Disk AB: $\mathbf{v}_B = \overline{AB}\omega_{AB} \nwarrow 30° = (0.200)(36) \nwarrow 30° = 7.2 \text{ m/s} \nwarrow 30°$

Rod BC: $\mathbf{v}_C = v_C \nwarrow 30°$

Since $\mathbf{v}_C$ is parallel to $\mathbf{v}_B$, bar BC is in translation

$$\mathbf{v}_C = 7.2 \text{ m/s} \nwarrow 30° \qquad \boldsymbol{\omega}_{BC} = 0$$

Rod CD: $$\omega_{CD} = \frac{v_C}{l_{CD}} = \frac{7.2 \text{ m/s}}{0.25 \text{ m}} = 28.8 \text{ rad/s}$$

$$\boldsymbol{\omega}_{CD} = 28.8 \text{ rad/s} \circlearrowright$$

Acceleration analysis. $\boldsymbol{\alpha}_{AB} = 0$

Disk AB: $$\mathbf{a}_B = \boldsymbol{\alpha}_{AB} \times \mathbf{r}_{B/A} - \omega_{AB}^2 \mathbf{r}_{B/A}$$

$$= [(150)(0.2) \searrow 30°] - [(36)^2(0.2) \nearrow 60°]$$

$$= [30 \text{ m/s}^2 \searrow 30°] + [259.2 \text{ m/s}^2 \swarrow 60°]$$

Rod BC: $$\boldsymbol{\alpha}_{BC} = 150 \text{ rad/s}^2 \circlearrowleft$$

$$\mathbf{a}_C = \mathbf{a}_B + (\mathbf{a}_{C/B})_t - \omega_{BC}^2 \mathbf{r}_{C/B}$$

$$\mathbf{a}_C = [30 \searrow] + [259.2 \swarrow 60°] + [0.4\alpha_{AB}] + 0 \tag{1}$$

Rod CD: $$\boldsymbol{\alpha}_{CD} = \alpha_{CD} \circlearrowleft$$

$$\mathbf{a}_C = (\mathbf{a}_{C/D})_t - \omega_{CD}^2 \mathbf{r}_{C/D} = [0.25\alpha_{CD} \searrow 30°] - [(28.8)^2(0.25) \nearrow 60°]$$

$$\mathbf{a}_C = [0.25\alpha_{CD} \searrow 30°] - [207.36 \nearrow 60°] \tag{2}$$

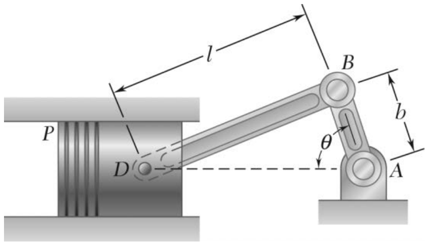
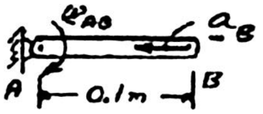
PROBLEM 16.137



In the engine system shown $l = 250$ mm and $b = 100$ mm. The connecting rod BD is assumed to be a 1.2-kg uniform slender rod and is attached to the 1.8-kg piston P. During a test of the system, crank AB is made to rotate with a constant angular velocity of 600 rpm clockwise with no force applied to the face of the piston. Determine the forces exerted on the connecting rod at B and D when $\theta = 180°$. (Neglect the effect of the weight of the rod.)

SOLUTION

<u>Kinematics</u>: Crank AB:



$$\omega_{AB} = 600 \text{ rpm}\left(\frac{2\pi}{60}\right) = 62.832 \text{ rad/s} \circlearrowright$$

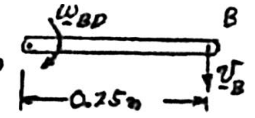
$$a_B = (AB)\omega_{AB}^2 = (0.1 \text{ m})(62.832 \text{ rad/s}^2)$$

$$\mathbf{a}_B = 394.78 \text{ m/s}^2 \longleftarrow$$

Also: $$v_B = (AB)\omega_{AB} = (0.1 \text{ m})(62.832 \text{ rad/s}) = 6.2832 \text{ m/s} \downarrow$$

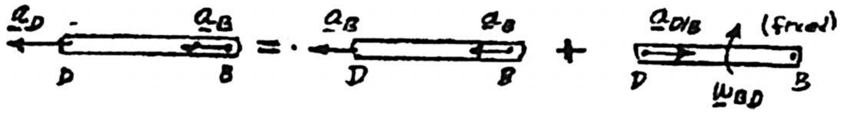
Connecting rod BD:

Velocity Instantaneous center at D.



$$\omega_{BD} = \frac{v_B}{BD} = \frac{6.2832 \text{ m/s}}{0.25 \text{ m}} = 25.133 \text{ rad/s}$$

Acceleration:



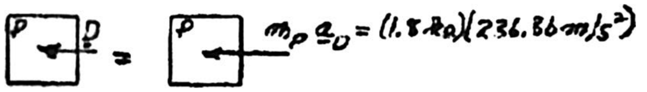
$$\mathbf{a}_D = \mathbf{a}_B + \mathbf{a}_{D/B} = [a_B \longleftarrow] + [(BD)\omega_{BD}^2 \longrightarrow]$$

$$\mathbf{a}_D = [394.78 \text{ m/s}^2 \longleftarrow] + [(0.25 \text{ m})(25.133 \text{ rad/s})^2 \longrightarrow]$$

$$\mathbf{a}_D = [397.78 \text{ m/s}^2 \longleftarrow] + [157.92 \text{ m/s}^2 \longleftarrow] = 236.86 \text{ m/s}^2 \longleftarrow$$

$$\overline{\mathbf{a}}_{BD} = \frac{1}{2}(\mathbf{a}_B + \mathbf{a}_D) = \frac{1}{2}(394.78 \longleftarrow + 236.86 \longleftarrow) = 315.82 \text{ m/s}^2 \longleftarrow$$

Kinetics of piston



$$\mathbf{D} = 426.35 \text{ N} \longleftarrow$$

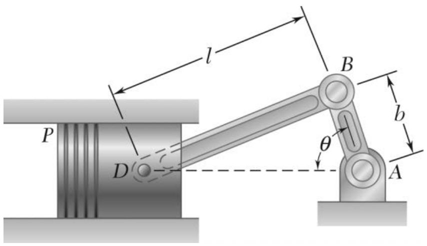
PROBLEM 16.138



Solve Problem 16.137 when $\theta = 90°$.

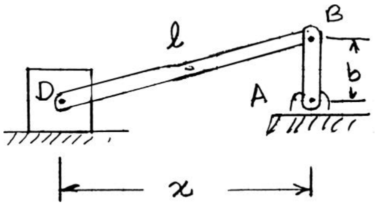
PROBLEM 16.137 In the engine system shown $l = 250$ mm and $b = 100$ mm. The connecting rod *BD* is assumed to be a 1.2-kg uniform slender rod and is attached to the 1.8-kg piston *P*. During a test of the system, crank *AB* is made to rotate with a constant angular velocity of 600 rpm clockwise with no force applied to the face of the piston. Determine the forces exerted on the connecting rod at *B* and *D* when $\theta = 180°$. (Neglect the effect of the weight of the rod.)

SOLUTION

Geometry: $l = 0.25$ m, $b = 0.1$ m, $x = \sqrt{l^2 - b^2} = 0.2291$ m

$$\mathbf{r}_{B/A} = (0.1 \text{ m})\mathbf{j}, \quad \mathbf{r}_{D/B} = -(0.2291 \text{ m})\mathbf{i} - (0.1 \text{ m})\mathbf{j}$$

Kinematics: $\omega_{AB} = 600 \text{ rev/min} = 62.832 \text{ rad/s}$



Velocity:

$$\boldsymbol{\omega}_{AB} = -(62.832 \text{ rad/s})\mathbf{k}$$

$$\mathbf{v}_B = \boldsymbol{\omega}_{AB} \times \mathbf{r}_{B/A}$$

$$= -(62.832\mathbf{k}) \times (0.1\mathbf{i})$$

$$= (6.2832 \text{ m/s})\mathbf{i}$$

$$\mathbf{v}_D = \mathbf{v}_B + \boldsymbol{\omega}_{BD} \times \mathbf{r}_{D/B}$$

$$v_D\mathbf{i} = 6.2832\mathbf{i} + \omega_{BD}\mathbf{k} \times (-0.2291\mathbf{i} - 0.1\mathbf{j})$$

$$= 6.2832\mathbf{i} + 0.1\omega_{BD}\mathbf{j} - 0.2291\omega_{BD}\mathbf{i}$$

Equating components gives

$$v_D = 6.2832 \text{ m/s}, \quad \omega_{BD} = 0.$$

Acceleration:

$$\boldsymbol{\alpha}_{AB} = 0, \quad \boldsymbol{\alpha}_{BD} = \alpha_{BD}\mathbf{k} \quad \mathbf{a}_D = a_D\mathbf{i}$$

$$\mathbf{a}_B = \boldsymbol{\alpha}_{AB} \times \mathbf{r}_{B/A} - \omega_{AB}^2\mathbf{r}_{B/A} = 0 - (62.832)^2(0.1\mathbf{j}) = -(394.78 \text{ m/s}^2)\mathbf{j}$$

$$\mathbf{a}_D = \mathbf{a}_B + \boldsymbol{\alpha}_{BD} \times \mathbf{r}_{B/D} - \omega_{BD}^2\mathbf{r}_{D/B}$$

$$a_D\mathbf{i} = -394.78\mathbf{j} + \alpha_{AB}\mathbf{k} \times (-0.2291\mathbf{i} - 0.1\mathbf{j}) - 0$$

$$= -394.78\mathbf{j} - 0.2291\alpha_{AB}\mathbf{j} + 0.1\alpha_{AB}\mathbf{i}$$

Equate like components.

$$\mathbf{j}: \quad 0 = -394.78 - 0.2291\alpha_{AB} \quad \alpha_{AB} = -1723 \text{ rad/s}^2$$

PROBLEM 16.139

The 4-lb rod AB and the 6-lb rod BC are connected as shown to a disk that is made to rotate in a vertical plane at a constant angular velocity of 6 rad/s clockwise. For the position shown, determine the forces exerted at A and B on rod AB.

SOLUTION

Kinematics:

Velocity

$$\omega_{AB} = 0$$

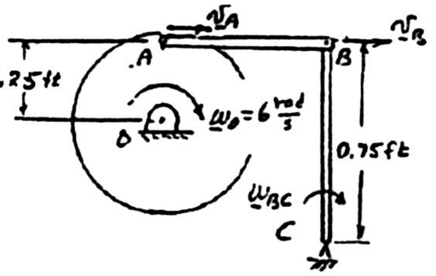
$$v_B = v_A$$

$$= (0.25 \text{ ft})(6 \text{ rad/s})$$

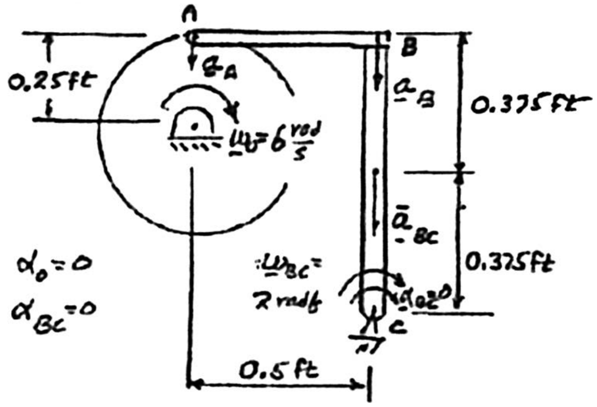
$$= 1.5 \text{ ft/s}^2$$

$$\omega_{BC} = \frac{v_B}{0.75 \text{ ft}} = \frac{1.5 \text{ m/s}^2}{0.75 \text{ ft}}$$

$$\boldsymbol{\omega}_{BC} = 2 \text{ rad/s} \circlearrowright$$



Acceleration



$$a_A = (0.25 \text{ ft})(6 \text{ rad/s})^2$$

$$\mathbf{a}_A = 9 \text{ ft/s}^2 \downarrow$$

$$\mathbf{a}_B = (0.75 \text{ ft})(2 \text{ rad/s})^2 = 3 \text{ ft/s}^2 \downarrow$$

$$\bar{a}_{BC} = (0.375 \text{ ft})(2 \text{ rad/s})^2$$

$$\bar{a}_{BC} = 1.5 \text{ ft/s}^2$$

PROBLEM 16.141

Two rotating rods in the vertical plane are connected by a slider block P of negligible mass. The rod attached at A has a weight of 1.6 lb and a length of 8 in. Rod BP weighs 2 lb and is 10 in. long and the friction between block P and AE is negligible. The motion of the system is controlled by a couple $\mathbf{M}$ applied to rod BP. Knowing that rod BP has a constant angular velocity of 20 rad/s clockwise, determine (*a*) the couple $\mathbf{M}$, (*b*) the components of the force exerted on AE by block P.

SOLUTION

Unit vectors: $\mathbf{i} = 1 \longrightarrow, \ \mathbf{j} = 1\uparrow, \ \mathbf{k} = 1 \circlearrowleft.$

Geometry:

$$\mathbf{r}_{P/A} = -\left(\frac{10}{12}\sin 30° \text{ ft}\right)\mathbf{j}$$

$$\mathbf{r}_{P/B} = -\left(\frac{10}{12}\cos 30° \text{ ft}\right)\mathbf{i} - \left(\frac{10}{12}\sin 30° \text{ ft}\right)\mathbf{j}$$

$$\mathbf{r}_{P/A} = -\left(\frac{8}{12} \text{ ft}\right)\mathbf{j}$$

Kinematics: $\boldsymbol{\omega}_{BP} = -(20 \text{ rad/s})\mathbf{k}, \qquad \boldsymbol{\alpha}_{BP} = 0$

Velocity analysis.

Rod BP:

$$\mathbf{v}_P = \boldsymbol{\omega}_{BP} \times \mathbf{r}_{P/B}$$

$$= -20\mathbf{k} \times \left(-\frac{10}{12}\cos 30°\mathbf{i} - \frac{10}{12}\sin 30°\mathbf{j}\right)$$

$$= -(8.3333 \text{ ft/s})\mathbf{i} + (14.4338 \text{ ft/s})\mathbf{j}$$

Rod AE: Use a frame of reference rotating with angular velocity $\boldsymbol{\omega}_{AE} = \omega_{AE}\mathbf{k}$. The collar P slides on the rod with relative velocity $\mathbf{v}_{P/A} = u\mathbf{j}$

$$\mathbf{v}_P = \mathbf{v}_{P'} + \mathbf{v}_{P/AE} = \boldsymbol{\omega}_{AE} \times \mathbf{r}_{P/A} + u\,\mathbf{j}$$

$$= \omega_{AE}\mathbf{k} \times \left(-\frac{10}{12}\sin 30°\mathbf{j}\right) + u\,\mathbf{j} = 0.41667\,\omega_{AE}\mathbf{i} + u\,\mathbf{j}$$

Equate the two expressions for $\mathbf{v}_P$ and resolve into components.

$\mathbf{i}$: $-8.3333 = 0.41667\,\omega_{AE}$ $\qquad \omega_{AE} = -20$ rad/s

$\mathbf{j}$: $14.4388 = u$ $\qquad u = 14.4338$ ft/s

Acceleration analysis.

Rod BP:

$$\mathbf{a}_P = \boldsymbol{\alpha}_{BP} \times \mathbf{r}_{P/B} - \omega_{BP}^2\mathbf{r}_{P/B}$$

$$= 0 - (20)^2\left(-\frac{10}{12}\cos 30°\mathbf{i} - \frac{10}{12}\sin 30°\mathbf{j}\right)$$

$$= (288.68 \text{ ft/s}^2)\,\mathbf{i} + (166.67 \text{ ft/s}^2)\mathbf{j}$$

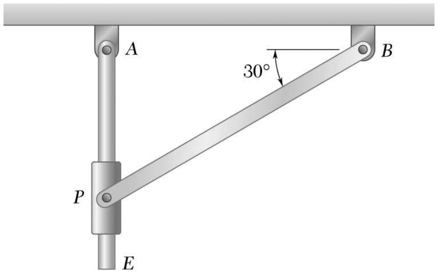
PROBLEM 16.142



Two rotating rods in the vertical plane are connected by a slider block P of negligible mass. The rod attached at A has a mass of 0.8 kg and a length of 160 mm. Rod BP has a mass of 1 kg and is 200 mm long and the friction between block P and AE is negligible. The motion of the system is controlled by a couple **M** applied to bar AE. Knowing that at the instant shown rod BP has an angular velocity of 20 rad/s clockwise and an angular acceleration of 80 rad/s^2 clockwise, determine (a) the couple **M**, (b) the components of the force exerted on AE by block P.

SOLUTION

Geometry:

$$\mathbf{r}_{P/A} = (0.200 \text{ m})\sin 30° \downarrow = 0.100 \text{ m} \downarrow$$

$$\mathbf{r}_{P/B} = 0.200 \text{ m} \nearrow 30°$$

$$\mathbf{r}_{E/A} = 0.160 \text{ m} \downarrow$$

Kinematics:

$$\boldsymbol{\omega}_{BP} = 20 \text{ rad/s} \circlearrowright$$

$$\boldsymbol{\alpha}_{BP} = 80 \text{ rad/s}^2 \circlearrowright$$

Velocity analysis.

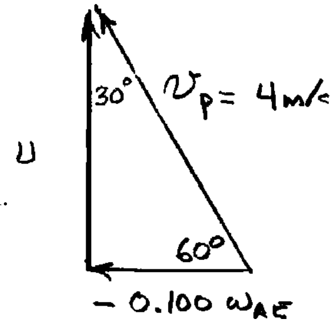
Rod BP:

$$\mathbf{v}_P = \boldsymbol{\omega}_{BP} \times \mathbf{r}_{P/B} = (20 \text{ rad/s}) \cdot (0.200 \text{ m}) \searrow 60° = 4 \text{ m/s} \searrow 60°$$

Rod AE: Use a frame of reference rotating with angular velocity $\boldsymbol{\omega}_{AE} = \omega_{AE} \circlearrowleft$. The collar slides on the rod with relative velocity $\mathbf{v}_{P/AE} = u \uparrow$.

$$\mathbf{v}_P = \mathbf{v}_{P'} + \mathbf{v}_{P/AE} = \omega_{AE} \times \mathbf{r}_{P/A} + u \uparrow$$

$$= 0.100\ \omega_{AE} \longrightarrow + u \uparrow$$



Equate the two expressions for $\mathbf{v}_P$ using a triangle construction for vector addition.

$$-0.100\omega_{AE} = 4\cos 60°$$

$$\omega_{AE} = -20 \text{ rad/s} \quad \boldsymbol{\omega}_{AE} = 20 \text{ rad/s} \circlearrowright$$

$$u = 4\sin 60° = 3.461 \text{ m/s} \qquad \mathbf{v}_{P/AE} = 3.4641 \text{ m/s} \uparrow$$

Acceleration analysis.

$$\boldsymbol{\alpha}_{BP} = \alpha_{BP} \circlearrowleft$$

Rod BP:

$$\mathbf{a}_P = \boldsymbol{\alpha}_{BP} \times \mathbf{r}_{P/B} - \omega_{BP}^2 \mathbf{r}_{P/B}$$

$$= [(80 \text{ rad/s}^2)(0.200 \text{ m}) \searrow 60°] + [(20 \text{ rad/s})^2 (0.200 \text{ m}) \measuredangle 30°]$$

$$= [16 \text{ m/s}^2 \searrow 60°] + [80 \text{ m/s}^2 \measuredangle 30°]$$

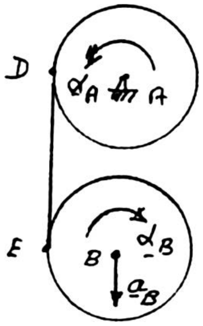
PROBLEM 16.143*

Two disks, each of mass m and radius r are connected as shown by a continuous chain belt of negligible mass. If a pin at Point C of the chain belt is suddenly removed, determine (a) the angular acceleration of each disk, (b) the tension in the left-hand portion of the belt, (c) the acceleration of the center of disk B.

SOLUTION

Kinematics: Assume α_A ↺ and α_B ↻



$$\omega_A = \omega_B = 0$$

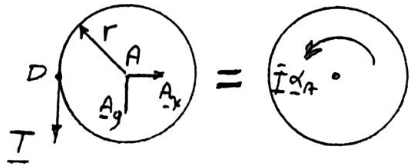
$$\mathbf{a}_D = r\alpha_A \downarrow$$

$$\mathbf{a}_E = a_D = r\alpha_A \downarrow$$

$$\bar{\mathbf{a}}_B = a_E + a_{B/E} = (r\alpha_A + r\alpha_B)$$

$$\bar{\mathbf{a}}_B = r(\alpha_A + \alpha_B)\downarrow$$

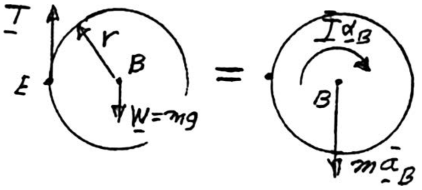
Kinetics: Disk A: $+\circlearrowleft\ \Sigma M_A = \Sigma(M_A)_{\text{eff}}:\quad Tr = \bar{I}\alpha_A$



$$Tr = \frac{1}{2}mr^2\alpha_A$$

$$\alpha_A = \frac{2T}{mr} \circlearrowleft \qquad (1)$$

Disk B: $+\circlearrowright\ \Sigma M_B = \Sigma(M_B)_{\text{eff}}:\quad Tr = \bar{I}\alpha_B$



$$Tr = \frac{1}{2}mr^2\alpha_B$$

$$\alpha_B = \frac{2T}{mr} \circlearrowright \qquad (2)$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 16.143* (Continued)

From Eqs. (1) and (2) we note that $\alpha_A = \alpha_B$

$$+\circlearrowright \Sigma M_E = \Sigma (M_E)_{\text{eff}}: \quad Wr = \bar{I}\alpha_B + (m\bar{a}_B)r$$

$$Wr = \frac{1}{2}mr^2\alpha_B + mr(\alpha_A + \alpha_B)r$$

$$\alpha_A = \alpha_B: \quad Wr = \frac{5}{2}mr^2\alpha_A \qquad \boldsymbol{\alpha}_A = \frac{2}{5}\frac{g}{r} \circlearrowleft \blacktriangleleft$$

$$\boldsymbol{\alpha}_B = \frac{2}{5}\frac{g}{r} \circlearrowright \blacktriangleleft$$

Substitute for α_A into (1):

$$\frac{2}{5}\frac{g}{r} = \frac{2T}{mr} \qquad T = \frac{1}{5}mg \blacktriangleleft$$

$$a_B = r(\alpha_A + \alpha_B)$$

$$= r(2\alpha_A)$$

$$= 2r\left(\frac{2}{5}\frac{g}{r}\right) \qquad \mathbf{a}_B = \frac{4}{5}g \downarrow \blacktriangleleft$$

PROBLEM 16.144*

A uniform slender bar AB of mass m is suspended as shown from a uniform disk of the same mass m. Neglecting the effect of friction, determine the accelerations of Points A and B immediately after a horizontal force **P** has been applied at B.

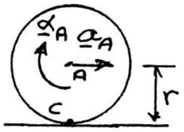
SOLUTION

<u>Kinematics</u>:

$$\omega = 0$$

Cylinder:

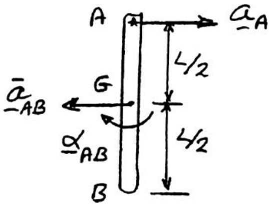
Rolling without sliding $\quad (a_C)_x = 0$



$$\xrightarrow{+} \mathbf{a}_A = (\mathbf{a}_C)_x + \mathbf{a}_{A/C} = 0 + r\alpha_A$$

$$\mathbf{a}_A = r\alpha_A \longrightarrow$$

Rod AB:



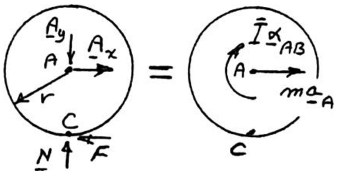
$$\boldsymbol{\alpha}_A = \frac{a_A}{r} \circlearrowright$$

$$\xrightarrow{+} a_A = \frac{L}{2}\alpha_{AB} - \bar{a}_{AB}$$

<u>Kinetics</u>:

$$+\circlearrowright \Sigma M_C = \Sigma(M_C)_{\text{eff}}: \quad A_x r = m a_A r + \bar{I}\alpha_A$$

Cylinder:

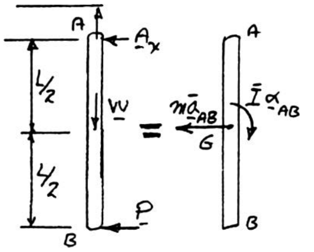


$$A_x r = m a_A r + \frac{1}{2}mr^2\left(\frac{a_A}{r}\right)$$

$$A_x = \frac{3}{2}m a_A$$

$$A_x = \frac{3}{2}m\left(\frac{L}{2}\alpha_{AB} - \bar{a}_{AB}\right) \qquad (1)$$

Rod AB:



$$+\circlearrowright \Sigma M_A = \Sigma(M_A)_{\text{eff}}: \quad PL = m\bar{a}_{AB}\frac{L}{2} + \bar{I}\alpha_{AB}$$

$$PL = m\bar{a}_{AB}\frac{L}{2} + \frac{m}{12}L^2\alpha_{AB} \qquad (2)$$

$$\xleftarrow{+} \Sigma F_x = \Sigma(F_x)_{\text{eff}}: \quad P + A_x = m\bar{a}_{AB}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 16.145

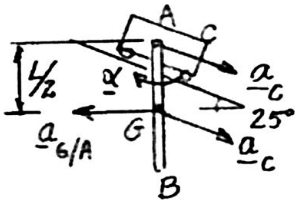
A uniform rod *AB*, of mass 15 kg and length 1 m, is attached to the 20-kg cart *C*. Neglecting friction, determine immediately after the system has been released from rest, (*a*) the acceleration of the cart, (*b*) the angular acceleration of the rod.

SOLUTION

<u>Kinematics</u>: We resolve the acceleration of *G* into the acceleration of the cart and the acceleration of *G* relative to *A*:

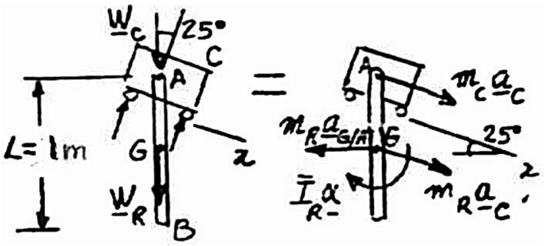
$$\bar{\mathbf{a}}_R = \mathbf{a}_G = \mathbf{a}_A + \mathbf{a}_{G/A}$$

$$\bar{\mathbf{a}}_R = \mathbf{a}_C + \mathbf{a}_{G/A}$$



where $$a_{G/A} = \frac{1}{2}L\alpha$$

<u>Kinetics</u>: Cart and rod



$$m_R = 15 \text{ kg}$$

$$m_C = 20 \text{ kg}$$

$$L = 1 \text{ m}$$

$$\bar{I}_R = \frac{1}{12}m_R L^2$$

$$a_{G/A} = \frac{1}{2}(1)\alpha = 0.5\alpha$$

$$\Sigma F_x = \Sigma(F_x)_{\text{eff}}: \quad (m_C + m_R)g\sin 25° = (m_C + m_R)\mathbf{a}_C - m_R a_{G/A}\cos 25°$$

$$g\sin 25° = a_C - \left(\frac{m_g}{m_C + m_R}\right)\left(\frac{L}{2}\alpha\right)\cos 25°$$

$$a_C = (9.81)\sin 25° + \left(\frac{15}{20+15}\right)(0.5\cos 25°)\alpha$$

$$a_C = (9.81)\sin 25° + 0.19421\alpha \qquad (1)$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 16.148*

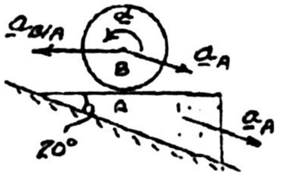
The 6-lb cylinder B and the 4-lb wedge A are held at rest in the position shown by cord C. Assuming that the cylinder rolls without sliding on the wedge and neglecting friction between the wedge and the ground, determine, immediately after cord C has been cut, (a) the acceleration of the wedge, (b) the angular acceleration of the cylinder.

SOLUTION



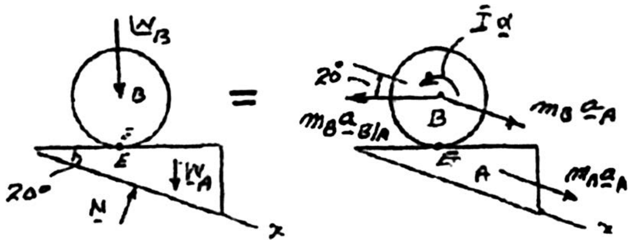
Kinematics: We resolve $\mathbf{a}_B$ into $\mathbf{a}_A$ and a horizontal component $\mathbf{a}_{B/A}$

$$\mathbf{a}_B = \mathbf{a}_A + \mathbf{a}_{B/A}$$

Where $a_{B/A} = r\alpha,$ since the cylinder B rolls on wedge A.

$$a_{B/A} = (0.25 \text{ ft})\alpha$$

Kinetics: Cylinder and wedge:



$$\searrow^{+} \Sigma F_x = \Sigma (F_x)_{\text{eff}}: \quad (W_A + W_B)\sin 20° = (m_A + m_B)a_A - m_B a_{B/A}\cos 20°$$

$$(10 \text{ lb})\sin 20° = \left(\frac{10}{g}\right)a_A - \left(\frac{6}{g}\right)(0.25\alpha)\cos 20°$$

$$a_A = g\sin 20° + \frac{6}{10}(0.25)\cos 20°\alpha$$

$$a_A = g\sin 20° + 0.15\cos 20°\alpha \qquad (1)$$

Cylinder: $\quad +\circlearrowright \Sigma M_E = \Sigma (M_E)_{\text{eff}}: \quad 0 = \bar{I}\alpha + (m_B a_{B/A})(0.25 \text{ ft}) - (m_B a_A \cos 20°)(0.25 \text{ ft})$

$$0 = \frac{1}{2}\frac{6 \text{ lb}}{g}(0.25 \text{ ft})^2\alpha + \frac{6 \text{ lb}}{g}(0.25\alpha)(0.25)$$

$$-\frac{6 \text{ lb}}{g}a_A\cos 20°(0.25)$$

$$0 = \frac{1}{g}[0.1875\alpha + 0.325\alpha - 1.4095a_A]$$

$$0 = 0.5625\alpha - 1.4095a_A$$

$$\alpha = 2.506a_A \qquad (2)$$

If you are a student using this Manual, you are using it without permission.*

PROBLEM 16.148* (Continued)

(*a*) Acceleration of the wedge.

Substitute for α from (2) into (1):

$$a_A = g\sin 20° + 0.15\cos 20°(2.506a_A)$$
$$a_A = 11.013 + 0.3532a_A$$
$$(1-0.3532)a_A = 11.013$$
$$a_A = 17.027 \text{ ft/s}^2$$

$\mathbf{a}_A = 17.03 \text{ ft/s}^2 \searrow 20°$ ◀

(*b*) Angular acceleration of the cylinder.

Eq. (2):
$$\alpha = 2.506a_A$$
$$= 2.506(17.027)$$
$$\alpha = 42.7 \text{ rad/s}^2$$

$\boldsymbol{\alpha} = 42.7 \text{ rad/s}^2 \circlearrowright$ ◀

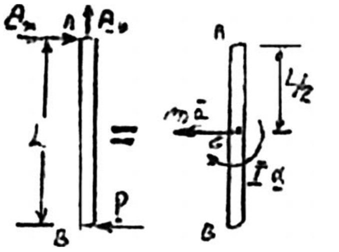
PROBLEM 16.151*

(*a*) Determine the magnitude and the location of the maximum bending moment in the rod of Problem 16.78.
(*b*) Show that the answer to Part *a* is independent of the weight of the rod.

SOLUTION



Rod *AB*: $\bar{a} = \frac{L}{2}\alpha$

$$+\circlearrowright \Sigma M_A = \Sigma(M_A)_{\text{eff}}: \quad PL = (m\bar{a})\frac{L}{2} + \bar{I}\alpha$$

$$= \left(m\frac{1}{2}\alpha\right)\frac{L}{2} + \frac{1}{12}mL^2\alpha$$

$$\boldsymbol{\alpha} = \frac{3P}{mL} \circlearrowright \qquad (1)$$

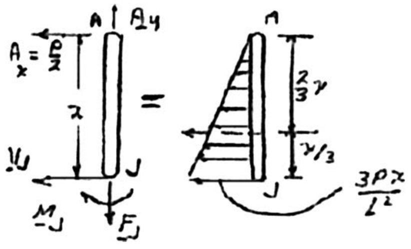
$$\xrightarrow{+} \Sigma F_x = \Sigma(F_x)_{\text{eff}}: \quad A_x - P = -m\bar{a}$$

$$A_x = P - m\frac{L}{2}\alpha = P - m\frac{L}{2}\left(\frac{3P}{mL}\right) = -\frac{P}{2} \qquad \mathbf{A}_x = \frac{1}{2}P \longleftarrow$$

<u>Portion *AJ* of Rod</u>:

<u>External forces</u>: A_x, W_{AJ}, axial force F_J, shear V_J, and bending moment M_J.

<u>Effective forces</u>: Since acceleration at any point is proportional to distance from *A*, effective forces are linearly distributed. Since mass per unit length is *m*/*L*, at Point *J* we find



$$\left(\frac{m}{L}\right)a_J = \frac{m}{L}(x\alpha)$$

Using (1):

$$\frac{m}{L}a_J = \frac{m}{L}\left(\frac{3P}{mL}\right)$$

$$\frac{m}{L}a_J = \frac{3Px}{L^2}$$

$$+\circlearrowright \Sigma M_J = \Sigma(M_J)_{\text{eff}}: \quad M_J - A_x x = -\frac{1}{2}\left(\frac{3Px}{L^2}\right)\left(\frac{2x}{3}\right)$$

$$M_J = \frac{1}{2}Px - \frac{1}{2}\frac{P}{L^2}x^3 \qquad (2)$$

For $M_{\max}$:

$$\frac{dM_J}{dx} = \frac{P}{2} - \frac{3}{2}\frac{P}{L^2}x^2 = 0$$

$$x = \frac{L}{\sqrt{3}} \qquad (3)$$

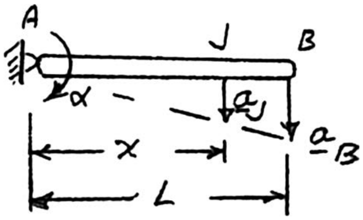
PROBLEM 16.152*

Draw the shear and bending-moment diagrams for the beam of Problem 16.84 immediately after the cable at B breaks.

SOLUTION

From answers to Problem 16.84:



$$\mathbf{a}_B = \frac{3}{2}g \downarrow \qquad \mathbf{A} = \frac{1}{4}mg \uparrow$$

We now find

$$\boldsymbol{\alpha} = \frac{a_B}{L} \circlearrowright = \frac{3g}{2L} \circlearrowright$$

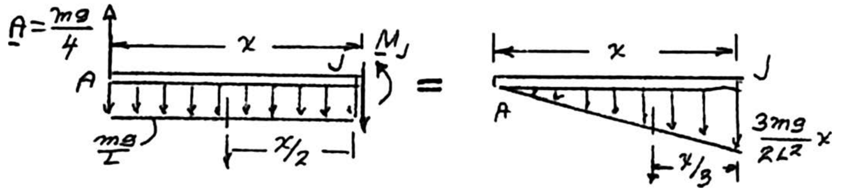
$$\mathbf{a}_J = x\alpha = \frac{3g}{2L}x \downarrow$$

Portion AJ of rod:

External forces: Reaction A, distributed load per unit length mg/L, shear V_J, bending moment M_J.

Effective forces: Since a is proportional to x, the effective forces are linearly distributed. The effective force per unit length at J is:

$$\frac{m}{L}a_J = \frac{m}{L}\cdot\frac{3g}{2L}x = \frac{3mg}{2L^2}x$$



$$+\downarrow \Sigma F_y = \Sigma (F_y)_{\text{eff}}: \quad \frac{mg}{L}x - \frac{mg}{4} + V_J = \frac{1}{2}\left(\frac{3mg}{2L^2}x\right)x$$

$$V_J = \frac{mg}{4} - \frac{mg}{L}x + \frac{3}{4}\frac{mg}{L^2}x^2$$

$$+\circlearrowright \Sigma M_J = \Sigma (M_J)_{\text{eff}}: \quad \left(\frac{mg}{L}x\right)\frac{x}{2} - \frac{mg}{4}x + M_J = \frac{1}{2}\left(\frac{3mg}{2L^2}x\right)x\left(\frac{x}{3}\right)$$

$$M_J = \frac{mg}{4}x - \frac{1}{2}\frac{mg}{L}x^2 + \frac{1}{4}\frac{mg}{L^2}x^3$$

Find $V_{\min}$:

$$\frac{dV_J}{dx} = -\frac{mg}{L} + \frac{3}{2}\frac{mg}{L^2}x = 0; \qquad x = \frac{2}{3}L$$

$$V_{\min} = \frac{mg}{4} - \frac{mg}{L}\left(\frac{2}{3}L\right) + \frac{3}{4}\frac{mg}{L^2}\left(\frac{2}{3}L\right)^2; \qquad V_{\min} = -\frac{mg}{12}$$

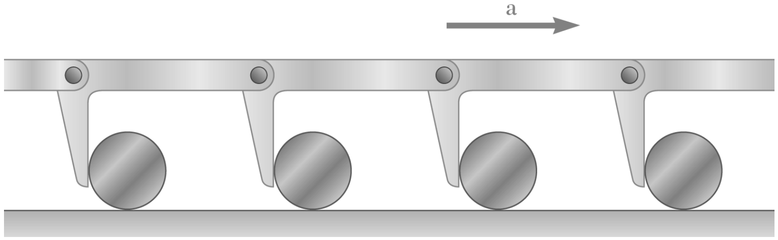
PROBLEM 16.156

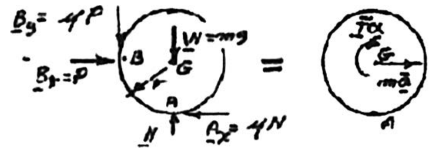
Identical cylinders of mass m and radius r are pushed by a series of moving arms. Assuming the coefficient of friction between all surfaces to be $\mu < 1$ and denoting by a the magnitude of the acceleration of the arms, derive an expression for (a) the maximum allowable value of a if each cylinder is to roll without sliding, (b) the minimum allowable value of a if each cylinder is to move to the right without rotating.



SOLUTION

(a) <u>Cylinder rolls</u> without sliding $a = r\alpha$ or $\alpha = \dfrac{a}{r}$

P is horizontal component of force that the arm exerts on cylinder.



$+\circlearrowright \Sigma M_A = \Sigma (M_A)_{\text{eff}}: \quad Pr - (\mu_k P)r = I\alpha + (m\bar{a})r$

$$P(1-\mu)r = \frac{1}{2}mr^2\left(\frac{\bar{a}}{r}\right) + (m\bar{a})r$$

$$P = \frac{3}{2}\frac{m\bar{a}}{(1-\mu)} \qquad (1)$$

$+\uparrow \Sigma F_y = 0: \quad N - \mu P - mg = 0 \qquad (2)$

$\xrightarrow{+} \Sigma F_x = \Sigma (F_x)_{\text{eff}}: \quad P - \mu N = m\bar{a} \qquad (3)$

Solve (2) for N and substitute for N into (3).

$$P - \mu^2 P - \mu mg = m\bar{a}$$

Substitute P from (1): $\quad (1-\mu^2)\dfrac{3}{2}\dfrac{m\bar{a}}{(1-\mu)} - \mu mg = m\bar{a}$

$$3(1+\mu)\bar{a} - 2\mu g = 2\bar{a}$$

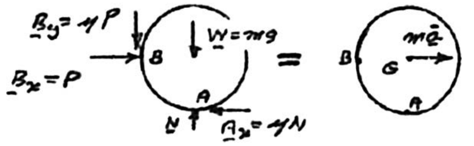
$$\bar{a}(1+3\mu) - 2\mu g = 0$$

$$\bar{a} = \frac{2\mu}{1+3\mu}g \ \blacktriangleleft$$

All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 16.156 (Continued)

(*b*) Cylinder translates: $\alpha = 0$



Sliding occurs at *A*: $A_x = \mu N$

Assume sliding impends at *B*: $B_y = \mu P$

$+\circlearrowleft \Sigma M_A = \Sigma(M_A)_{\text{eff}}$: $Pr - \mu Pr = (m\bar{a})r$

$$P(1-\mu)r = m\bar{a}\,r$$

$$P = \frac{m\bar{a}}{1-\mu} \qquad (4)$$

$\xrightarrow{+} \Sigma F_x = \Sigma(F_x)_{\text{eff}}$: $P - \mu N = m\bar{a}$ (5)

$+\uparrow \Sigma F_y = \Sigma(F_y)_{\text{eff}}$: $N - \mu P - mg = 0$ (6)

Solve (5) for *N* and substitute for *N* into (6).

$$P - P\mu^2 - \mu mg = m\bar{a}$$

Substitute for *P* from (4):

$$\frac{m\bar{a}}{1-\mu}(1-\mu^2) - \mu mg = m\bar{a}$$

$$\bar{a}(1+\mu) - \mu g = \bar{a}$$

$$\bar{a}\mu - \mu g = 0$$

$\bar{a} = g$ ◀

Summary: $a < \dfrac{2\mu}{1+3\mu} g$: Rolling

$\dfrac{3\mu}{1+3\mu} g < a < g$: Rotating and sliding

$a > g$: Translation

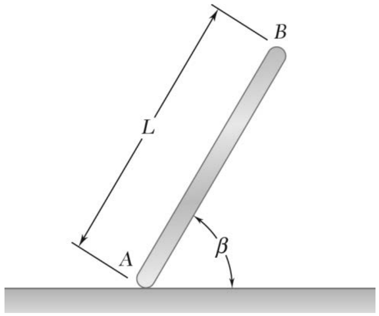
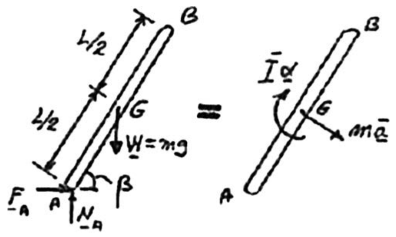
PROBLEM 16.157



The uniform rod AB of weight W is released from rest when $\beta = 70°$. Assuming that the friction force between end A and the surface is large enough to prevent sliding, determine immediately after release (a) the angular acceleration of the rod, (b) the normal reaction at A, (c) the friction force at A.

SOLUTION

We note that rod rotates about A. $\omega = 0$



$$\bar{I} = \frac{1}{12}mL^2$$

$$\bar{a} = \frac{L}{2}\alpha$$

$$+\circlearrowright \Sigma M_A = \Sigma(M_A)_{\text{eff}}: \quad mg\left(\frac{L}{2}\cos\beta\right) = \bar{I}\alpha + (m\bar{a})\frac{L}{2}$$

$$\frac{1}{2}mgL\cos\beta = \frac{1}{12}mL^2\alpha + \left(m\frac{L}{2}\alpha\right)\frac{L}{2}$$

$$= \frac{1}{3}mL^2\alpha$$

$$\alpha = \frac{3}{2}\frac{g\cos\beta}{L} \tag{1}$$

$$\xrightarrow{+} \Sigma F_x = \Sigma(F_x)_{\text{eff}}: \quad F_A = m\bar{a}\sin\beta$$

$$F_A = m\frac{L}{2}\alpha\sin\beta = m\frac{L}{2}\left(\frac{3}{2}\frac{g\cos\beta}{L}\right)\sin\beta$$

$$F_A = \frac{3}{4}mg\sin\beta\cos\beta \tag{2}$$

$$+\uparrow \Sigma F_y = \Sigma(F_y)_{\text{eff}}: \quad N_A - mg = -m\bar{a}\cos\beta = -m\left(\frac{L}{2}\alpha\right)\cos\beta$$

$$N_A - mg = -m\frac{L}{2}\left(\frac{3}{2}\frac{g\cos\beta}{L}\right)\cos\beta$$

$$N_A = mg\left(1 - \frac{3}{4}\cos^2\beta\right) \tag{3}$$

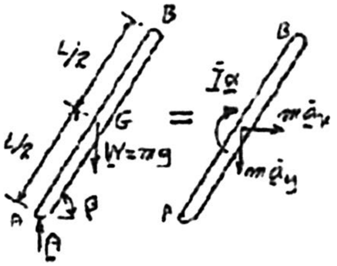
PROBLEM 16.158

The uniform rod AB of weight W is released from rest when $\beta = 70°$. Assuming that the friction force is zero between end A and the surface, determine immediately after release (a) the angular acceleration of the rod, (b) the acceleration of the mass center of the rod, (c) the reaction at A.

SOLUTION

$\xrightarrow{+} \Sigma F_x = \Sigma (F_x)_{\text{eff}}:\qquad a = m\bar{\mathbf{a}}_x \quad \bar{\mathbf{a}}_x = 0$



$$\mathbf{a}_A = \bar{\mathbf{a}}_y + \frac{L}{2}\alpha \searrow \beta$$

$$+\!\downarrow 0 = a_y - \frac{L}{2}\alpha\cos\beta$$

$$\mathbf{a}_y = \frac{L}{2}\alpha\cos\beta \downarrow$$

$+\!\downarrow \Sigma F_y = \Sigma (F_y)_{\text{eff}}:\qquad mg - A = m\bar{a}_y = m\left(\frac{L}{2}\alpha\cos\beta\right) \qquad (1)$

$+\circlearrowright \Sigma M_G = \Sigma (M_G)_{\text{eff}}:\quad A\left(\frac{L}{2}\cos\beta\right) = \bar{I}\alpha = \frac{1}{12}mL^2\alpha$

$$A = \frac{mL}{6}\frac{\alpha}{\cos\beta} \qquad (2)$$

Substitute (2) into (1):

$$mg - \frac{mL}{6}\frac{\alpha}{\cos\beta} = m\frac{L}{2}\alpha\cos\beta$$

$$g = \left(\frac{L}{2}\cos\beta + \frac{L}{6\cos\beta}\right)\alpha$$

$$g = \frac{L}{6}\left(3\cos\beta + \frac{1}{\cos\beta}\right)\alpha$$

$$g = \frac{L}{6}\left(\frac{3\cos^2\beta + 1}{\cos\beta}\right)\alpha$$

$$\alpha = \frac{6g}{L}\left(\frac{\cos\beta}{1 + 3\cos^2\beta}\right) \circlearrowright$$

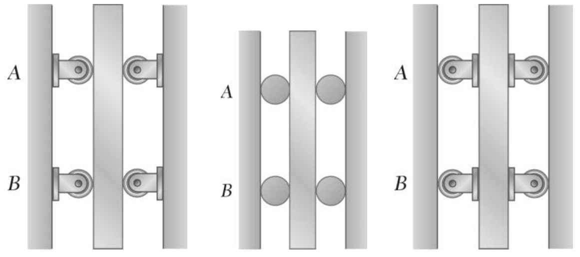
PROBLEM 16.159



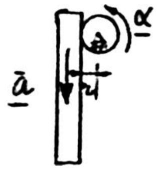
(a) (b) (c)

A bar of mass $m = 5$ kg is held as shown between four disks, each of mass $m' = 2$ kg and radius $r = 75$ mm. Knowing that the normal forces on the disks are sufficient to prevent any slipping, for each of the cases shown determine the acceleration of the bar immediately after it has been released from rest.

SOLUTION

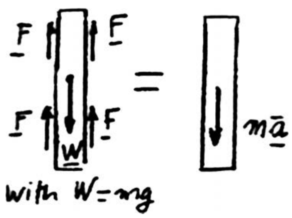
(a) Configuration (a)

Kinematics:



$$\bar{a} = r\alpha \qquad \alpha = \frac{\bar{a}}{r}$$

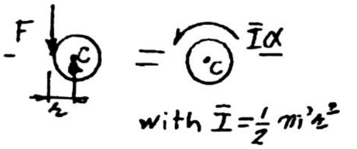
Kinetics of bar



$$+\!\downarrow \Sigma F_y = \Sigma (F_y)_{\text{eff}}:$$

$$W - 4F = m\bar{a} \qquad (1)$$

Kinetics of one disk



$$+\circlearrowright \Sigma M_C = \Sigma (M_C)_{\text{eff}}: \quad Fr = \bar{I}\alpha$$

$$Fr = \frac{1}{2}m'r^2\left(\frac{\bar{a}}{r}\right)$$

$$F = \frac{1}{2}m'\bar{a} \qquad (2)$$

Substitute for F from (2) into (1).

$$mg - 4\left(\frac{1}{2}m'\bar{a}\right) = m\bar{a}$$

$$mg = (m + 2m')\bar{a} \qquad \bar{a} = \frac{mg}{m + 2m'}$$

$$m = 5\text{ kg}, \quad m' = 2\text{ kg}: \quad \bar{a} = \frac{5}{5 + 2(2)}g$$

$$\bar{\mathbf{a}} = \frac{5}{9}g \downarrow \blacktriangleleft$$

(b) Configuration (b)

Kinematics:

Disk is rolling on vertical wall

$$\bar{a}' = a_C = r\alpha$$

$$\bar{a} = a_r = 2r\alpha$$

Therefore:

$$\alpha = \frac{\bar{a}}{2r}$$

$$\bar{a}' = r\alpha = \frac{1}{2}\bar{a}$$

PROBLEM 16.161

A cylinder with a circular hole is rolling without slipping on a fixed curved surface as shown. The cylinder would have a weight of 16 lb without the hole, but with the hole it has a weight of 15 lb. Knowing that at the instant shown the disk has an angular velocity of 5 rad/s clockwise, determine (*a*) the angular acceleration of the disk, (*b*) the components of the reaction force between the cylinder and the ground at this instant.

SOLUTION

Geometry: Let the mass center G of the cylinder lie a distance b below the geometric center for the position shown. Let C, the contact point between the cylinder and the fixed curved surface, be the origin of a coordinate system, as shown. The position vector of a point is

$$\mathbf{r} = x\mathbf{i} + y\mathbf{j}$$

Let r be the radius of the cylinder and R that of the fixed curved surface

Kinematics:

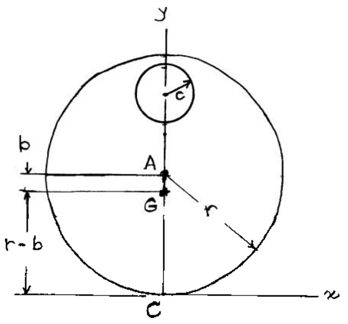
The acceleration $\mathbf{a}_P$ at a point is given by

$$\mathbf{a}_P = \mathbf{a}_C + \boldsymbol{\alpha}\times\mathbf{r}_{P/C} - \omega^2\mathbf{r}_{P/C}$$

Let

$$\boldsymbol{\alpha} = \alpha \circlearrowright$$

Then, using the coordinate system



$$\mathbf{a}_P = [(a_C)_x \longrightarrow] + [(a_C)_y \uparrow]$$

$$+[y\alpha \longrightarrow] + [x\alpha \downarrow]$$

$$+[y\omega^2 \downarrow] + [x\omega^2 \longleftarrow]$$

Since the cylinder rolls without slipping on a fixed surface,

$$(a_C)_x = 0$$

For Points G and A,

$$\mathbf{a}_G = [(a_C)_y \uparrow] + [(r-b)\alpha \longrightarrow] + [(r-b)\omega^2 \downarrow] \quad (1)$$

$$\mathbf{a}_A = [(a_C)_y \uparrow] + [r\alpha \longrightarrow] + [r\omega^2 \downarrow] \quad (2)$$

Subtract Eq. (2) from Eq. (1) to eliminate $(a_C)_y$

$$\mathbf{a}_G = \mathbf{a}_A = [b\alpha \longleftarrow] + [b\omega^2 \uparrow]$$

$$\mathbf{a}_G = \mathbf{a}_A + [b\alpha \longleftarrow] + [b\omega^2 \uparrow]$$

$$= [(a_A)_x \longrightarrow] + [(\mathbf{a}_A)_y \uparrow] + [b\alpha \longleftarrow] + [b\omega^2 \uparrow]$$

$$= [(r-b)\alpha \longrightarrow] + [(\mathbf{a}_A)_y \uparrow] + [b\omega^2 \uparrow] \quad (3)$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

Point C is the instantaneous center, so that

$$\mathbf{v}_A = r\omega \longrightarrow$$

Point A is constrained to move on a circle of radius

$$\rho = R + r$$

so its vertical component of acceleration is

$$(\mathbf{a}_A)_y = \frac{v_A^2}{\rho}\downarrow = \frac{r^2\omega^2}{\rho}\downarrow$$

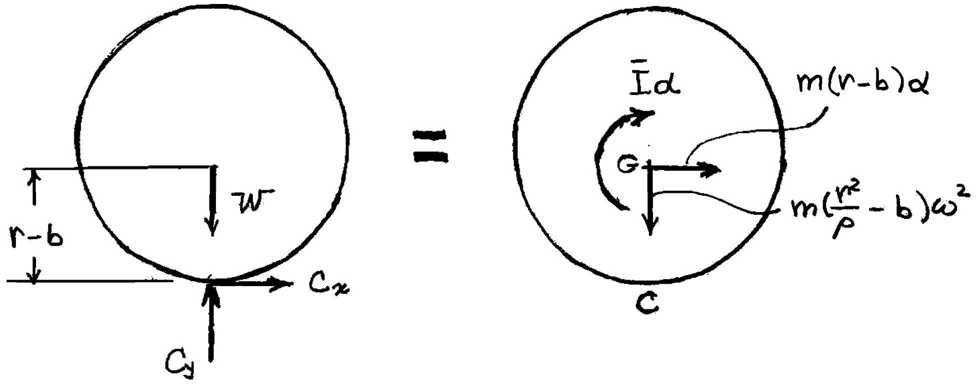
Using Eq. 3,
$$\mathbf{a}_G = [(r-b)\alpha \longrightarrow] + \left(\frac{r^2}{\rho} - b\right)\downarrow$$

The effective force at the mass center is

$$m\mathbf{a}_G = [m(r-b)\alpha \longrightarrow] + \left(\frac{r^2}{\rho} - b\right)\omega^2\downarrow$$

Kinetics:

$$+\circlearrowleft \Sigma M_C = \Sigma(M_C)_{\text{eff}}: \quad 0 + \bar{I}\alpha + (r-b)m(r-b)\alpha$$
$$= [\bar{I} + m(r-b)^2]\alpha$$



(*a*) *Angular acceleration.* $\boldsymbol{\alpha} = 0$ ◀

PROBLEM 16.161 (Continued)

It remains to determine the distance b from the mass distribution of the cylinder.

The mass center G coincides with the centroid of a circular cylinder of area $A_1 = \pi r^2$ with a circular cut out of area $A_2 = \frac{1}{16}A$, with its center located $\frac{2}{3}r$ above the center of A_1.

	A_1	$\bar{y}_1$	$A_1\bar{y}_1$
(1)	πr^2	0	0
(2)	$-\frac{1}{16}\pi r^2$	$\frac{2}{3}r$	$-\frac{1}{24}\pi r^3$
Σ	$\frac{15}{16}\pi r^2$		$-\frac{1}{24}\pi r^3$

$$\bar{Y}\Sigma A = \Sigma A\bar{y}_1$$

$$\frac{15}{16}\pi r^2 \bar{Y} = -\frac{1}{24}\pi r^3$$

$$\bar{Y} = -\frac{2}{45}r$$

$$b = \frac{2}{45}r$$

Data: $r = 12 \text{ in.} = 1 \text{ ft}, \quad R = 36 \text{ in.}, \quad \rho = 48 \text{ in.}$

$$b = \frac{2}{45}(12) = 0.53333 \text{ in.}$$

$$\left(\frac{r^2}{\rho} - b\right) = \frac{144}{48} - 0.53333 = 2.4667 \text{ in.} = 0.20556 \text{ ft}$$

$$C_y = 15 \text{ lb} - \frac{15 \text{ lb}}{32.2 \text{ ft/s}^2}(0.20556 \text{ ft})(5 \text{ rad/s})^2$$

$\mathbf{C} = 12.61 \text{ lb}\uparrow$ ◀

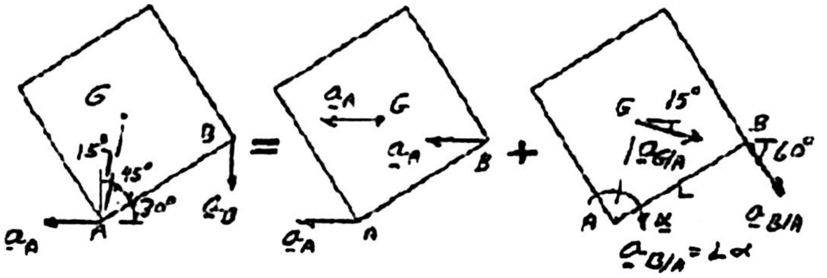
PROBLEM 16.162

The motion of a square plate of side 150 mm and mass 2.5 kg is guided by pins at corners *A* and *B* that slide in slots cut in a vertical wall. Immediately after the plate is released from rest in the position shown, determine (*a*) the angular acceleration of the plate, (*b*) the reaction at corner *A*.

SOLUTION

Kinematics: $AG = \dfrac{L}{2}\sqrt{2} = \dfrac{L}{\sqrt{2}} \quad a_{G/A} = (AB)\alpha = \dfrac{L\alpha}{\sqrt{2}}$

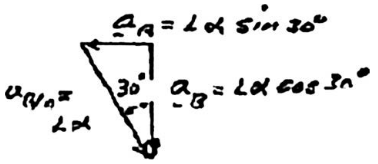


Plane motion = Translation + Rotation

$$a_B\downarrow = a_A \longleftarrow + a_{B/A} \searrow 60°$$

$$a_B\downarrow = a_A \longleftarrow + L\alpha \searrow 60°$$

$$\bar{a} = a_A \longleftarrow + a_{G/A} \searrow 15°$$



$$\bar{\mathbf{a}} = [L\alpha \sin 30° \longleftarrow] + \left[\frac{L\alpha}{\sqrt{2}} \searrow 15°\right] = [0.5L\alpha \longleftarrow] + [0.707L\alpha \searrow 15°]$$

Law of cosines

$$\bar{a}^2 = a_A^2 \cdot a_{G/A}^2 - 2a_A a_{G/A}\cos 15°$$

$$\bar{a}^2 = (0.5L\alpha)^2 + (0.707L\alpha)^2$$
$$-2(0.5L\alpha)(0.707L\alpha)\cos 15°$$

$$\bar{a}^2 = L^2\alpha^2(0.25 + 0.5 - 0.68301)$$

$$a^2 = L^2\alpha^2(0.06699)$$

$$\bar{a} = 0.25882L\alpha$$

PROBLEM 16.164

The Geneva mechanism shown is used to provide an intermittent rotary motion of disk *S*. Disk *D* weighs 2 lb and has a radius of gyration of 0.9 in. and disk *S* weighs 6 lb and has a radius of gyration of 1.5 in. The motion of the system is controlled by a couple **M** applied to disk *D*. A pin *P* is attached to disk *D* and can slide in one of the six equally spaced slots cut in disk *S*. It is desirable that the angular velocity of disk *S* be zero as the pin enters and leaves each of the six slots; this will occur if the distance between the centers of the disks and the radii of the disks are related as shown. Knowing disk *D* rotates with a constant counterclockwise angular velocity of 8 rad/s and the friction between the slot and pin *P* is negligible, determine when $\phi = 150°$ (*a*) the couple **M**, (*b*) the magnitude of the force pin *P* applies to disk *S*.

SOLUTION

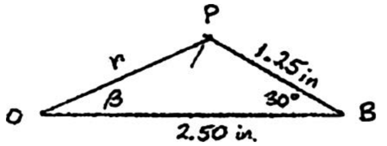
Geometry:

Law of cosines. $r^2 = 1.25^2 + 2.50^2 - (2)(1.25)(2.50)\cos 30°$

$r = 1.54914$ in.

Law of sines. $\dfrac{\sin\beta}{1.25} = \dfrac{\sin 30°}{r}$

$\beta = 23.794°$



Let disk *S* be a rotating frame of reference.

$$\mathbf{\Omega} = \omega_S \circlearrowright, \quad \dot{\mathbf{\Omega}} = \alpha_S \circlearrowright$$

Motion of coinciding Point P′ on the disk.

$$\mathbf{v}_{P'} = r\omega_S = 1.54914\omega_S \searrow \beta$$

$$\mathbf{a}_{P'} = -\alpha_S \mathrm{k} \times \mathrm{r}_{P/O} - \omega_S^2 \mathrm{r}_{P/O} = [1.54914\alpha_S \searrow \beta] + [1.54914\omega_S^2 \swarrow \beta]$$

Motion relative to the frame.

$$\mathbf{v}_{P/S} = u \swarrow \beta \qquad \mathrm{a}_{P/S} = \dot{u} \swarrow \beta$$

Coriolis acceleration. $2\omega_S u \nwarrow \beta$

$$\mathbf{v}_P = \mathbf{v}_{P'} + \mathbf{v}_{P/S} = [1.54914\omega_S \searrow \beta] + [u \swarrow \beta]$$

$$\mathbf{a}_P = \mathbf{a}_P + \mathbf{a}_{P/S} + 2\omega_S u \nwarrow$$

$$= [1.54914\alpha_S \searrow \beta] + [1.54914\omega_S^2 \swarrow \beta] + [\dot{u} \swarrow \beta] + [2\omega_S u \nwarrow \beta]$$

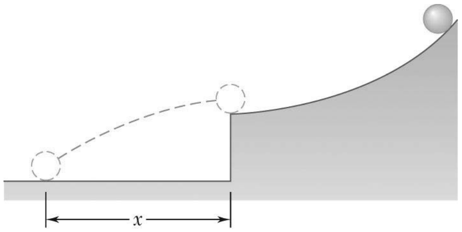
CHAPTER 17

PROBLEM 17.CQ1

A round object of mass *m* and radius *r* is released from rest at the top of a curved surface and rolls without slipping until it leaves the surface with a horizontal velocity as shown. Will a solid sphere, a solid cylinder or a hoop travel the greatest distance *c*?

(*a*) A solid sphere
(*b*) A solid cylinder
(*c*) A hoop
(*d*) They will all travel the same distance.



SOLUTION

Answer: (*a*) It has the smallest mass moment of inertia, so it will have the greatest speed at the bottom of the surface.

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 17.CQ2

A solid steel sphere *A* of radius *r* and mass *m* is released from rest and rolls without slipping down an incline as shown. After traveling a distance *d* the sphere has a speed *v*. If a solid steel sphere of radius 2*r* is released from rest on the same incline, what will its speed be after rolling a distance *d*?

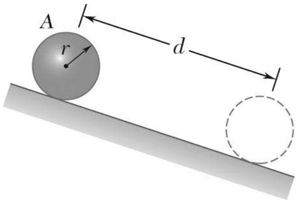
(*a*) 0.25 *v*

(*b*) 0.5 *v*

(*c*) *v*

(*d*) 2*v*

(*e*) 4*v*



SOLUTION

Answer: (*c*) Using conservation of energy you can show that the speed after traveling a distance *d* will be independent of the mass and the radius.

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 17.CQ4

In Problem 17.CQ3, how will the speeds of the centers of gravity compare for the two cases when $\theta = 0°$?

(*a*) Case 1 will be larger.

(*b*) Case 2 will be larger.

(*c*) The speeds will be the same.

SOLUTION

Answer: (*b*) Case 1 will also have rotational kinetic energy, so the speed will be smaller.

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

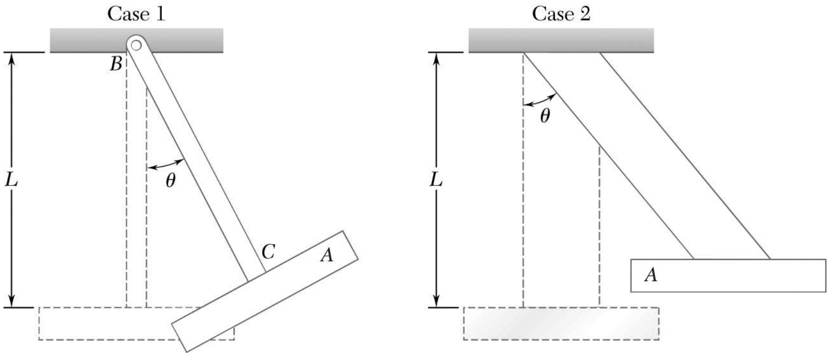
PROBLEM 17.CQ5

Slender bar A is rigidly connected to a massless rod BC in Case 1 and two massless cords in Case 2 as shown. The vertical thickness of bar A is not negligible compared to L. In both cases A is released from rest at an angle $\theta = \theta_0$. When $\theta = \theta°$ which system will have the largest kinetic energy?

(a) Case 1

(b) Case 2

(c) The kinetic energy will be the same.



SOLUTION

Answer: (a) Case 1 will have a greater change in gravitational potential energy, so the kinetic energy will be larger.

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. PROBLEM 17.1

The rotor of an electric motor has an angular velocity of 3600 rpm when the load and power are cut off. The 50-kg rotor then coasts to rest after 5000 revolutions. Knowing that the kinetic friction of the rotor produces a couple of magnitude 4 N · m, determine the centroidal radius of gyration of the rotor.

SOLUTION

Angular velocities: $\omega_1 = 3600\frac{\text{rev}}{\text{min}}\cdot\frac{1\,\text{min}}{60\,\text{s}}\cdot\frac{2\pi\,\text{rad}}{\text{rev}} = 120\pi\ \text{rad/s}$

$$\omega_2 = 0$$

Angular displacement: $5000\ \text{rev} = 10000\pi\ \text{rad}$

Principle of work and energy: $T_1 + U_{1\to 2} = T_2$:

$$T_1 = \frac{1}{2}\bar{I}\omega_1^2 = \frac{1}{2}\bar{I}(120\pi)^2 = 71.061\times 10^3\,\bar{I}$$

$$T_2 = \frac{1}{2}\bar{I}\omega_2^2 = 0$$

$$U_{1\to 2} = -M\theta = -(4\ \text{N}\cdot\text{m})(10000\pi\ \text{rad}) = -40000\pi\ \text{N}\cdot\text{m}$$

$$71.061\times 10^3\,\bar{I} - 40000\pi = 0$$

$$\bar{I} = 1.76839\ \text{kg}\cdot\text{m}^2$$

$$\bar{I} = m\bar{k}^2$$

Centroidal radius of gyration. $\bar{k} = \sqrt{\frac{\bar{I}}{m}} = \sqrt{\frac{1.76839\ \text{kg}\cdot\text{m}^2}{50\ \text{kg}}} = 0.1881\ \text{m}$

$\bar{k} = 188.1\ \text{mm}$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 17.2

It is known that 1500 revolutions are required for the 6000-lb flywheel to coast to rest from an angular velocity of 300 rpm. Knowing that the radius of gyration of the flywheel is 36 in., determine the average magnitude of the couple due to kinetic friction in the bearings.

SOLUTION

Angular velocity:

$$\omega_0 = 300 \text{ rpm}$$
$$= 10\pi \text{ rad/s}$$
$$\omega_2 = 0$$

Moment of inertia:

$$\bar{I} = m\bar{k}^2 = \frac{6000 \text{ lb}}{32.2 \text{ ft/s}^2}(3 \text{ ft})^2$$
$$= 1677 \text{ lb} \cdot \text{ft} \cdot \text{s}^2$$

Kinetic energy:

$$T_1 = \frac{1}{2}\bar{I}\omega_0^2$$
$$= \frac{1}{2}(1677)(10\pi)^2$$
$$= 827,600 \text{ ft} \cdot \text{lb}$$
$$T_2 = 0$$

Work:

$$U_{1\to 2} = -M\theta$$
$$= -M(1500 \text{ rev})(2\pi \text{ rad/rev})$$
$$= -9424.7M$$

Principle of work and energy:

$$T_1 + U_{1\to 2} = T_2$$
$$827,600 - 9424.7M = 0$$

Average friction couple: $M = 87.81 \text{ lb} \cdot \text{ft}$ $\qquad M = 87.8 \text{ lb} \cdot \text{ft}$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. PROBLEM 17.3

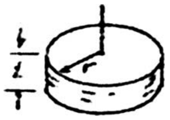
Two disks of the same material are attached to a shaft as shown. Disk A has a weight of 30 lb and a radius $r = 5$ in. Disk B is three times as thick as disk A. Knowing that a couple **M** of magnitude 15 lb · ft is to be applied to disk A when the system is at rest, determine the radius nr of disk B if the angular velocity of the system is to be 600 rpm after 4 revolutions.

SOLUTION



For any disk: $$m = \rho(\pi r^2 t)$$

$$\bar{I} = \frac{1}{2}mr^2$$

$$= \frac{1}{2}\pi\rho t r^4$$

Moment of inertia.

Disk A: $$I_A = \frac{1}{2}\pi\rho b r^4$$

Disk B: $$I_B = \frac{1}{2}\pi\rho(3b)(nr)^4$$

$$= 3n^4\left[\frac{1}{2}\pi\rho b r^4\right]$$

$$= 3n^4 I_A$$

$$I_{\text{total}} = I_A + I_B = (1 + 3n^4)I_A \qquad (1)$$

Angular velocity: $$\omega_1 = 0$$

$$\omega_2 = 600 \text{ rpm}$$

$$= 20\pi \text{ rad/s}$$

Rotation: $$\theta = 4 \text{ rev} = 8\pi \text{ rad}$$

Kinetic energy: $$T_1 = 0$$

$$T_2 = \frac{1}{2}I_{\text{total}}\,\omega_2^2$$

Work: $$U_{1\to 2} = M\theta$$

$$= (15 \text{ lb}\cdot\text{ft})(8\pi \text{ rad})$$

$$= 376.99 \text{ lb}\cdot\text{ft}$$

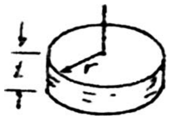
PROBLEM 17.4

Two disks of the same material are attached to a shaft as shown. Disk *A* is of radius *r* and has a thickness *b*, while disk *B* is of radius *nr* and thickness 3*b*. A couple **M** of constant magnitude is applied when the system is at rest and is removed after the system has executed 2 revolutions. Determine the value of *n* which results in the largest final speed for a point on the rim of disk *B*.

SOLUTION



For any disk:

$$m = \rho(\pi r^2 t)$$

$$\bar{I} = \frac{1}{2} m r^2$$

$$= \frac{1}{2}\pi\rho t r^4$$

Moment of inertia.

Disk *A*:

$$I_A = \frac{1}{2}\pi\,\rho\, b\, r^4$$

Disk *B*:

$$I_B = \frac{1}{2}\pi\,\rho(3b)(nr)^4$$

$$= 3n^4\left[\frac{1}{2}\pi\rho b r^4\right]$$

$$= 3n^4 I_A$$

$$I_{\text{total}} = I_A + I_B$$

$$= (1+3n^4)I_A$$

Work-energy.

$$T_1 = 0 \qquad U_{1\to 2} = M\theta = M(4\pi\,\text{rad})$$

$$T_2 = \frac{1}{2} I_{\text{total}}\,\omega_2^2$$

$$T_1 + U_{1\to 2} = T_2:\quad 0 + M(4\pi) = \frac{1}{2}(1+3n^4)I_A\omega_2^2$$

$$\omega_2^2 = \frac{8\pi M}{(1+3n^4)I_A}$$

For Point *D* on rim of disk *B*

$$v_D = (nr)\omega_2 \quad \text{or} \quad v_D^2 = n^2 r^2 \omega_2^2 = \frac{8\pi M r^2}{I_A}\cdot\frac{n^2}{1+3n^4}$$

PROBLEM 17.5

The flywheel of a small punch rotates at 300 rpm. It is known that 1800 ft · lb of work must be done each time a hole is punched. It is desired that the speed of the flywheel after one punching be not less that 90 percent of the original speed of 300 rpm. (*a*) Determine the required moment of inertia of the flywheel. (*b*) If a constant 25-lb · ft couple is applied to the shaft of the flywheel, determine the number of revolutions which must occur between each punching, knowing that the initial velocity is to be 300 rpm at the start of each punching.

SOLUTION

Angular velocities: $\omega_1 = 300 \text{ rpm} = 10\pi \text{ rad/s}$

$$\omega_2 = 0.90\omega_1 = 9\pi \text{ rad/s}$$

Principle of work and energy: $T_1 + U_{1\to 2} = T_2$

$$T_1 = \frac{1}{2}\bar{I}\omega_1^2 = \frac{1}{2}\bar{I}(10\pi)^2$$

$$T_2 = \frac{1}{2}\bar{I}\omega_2^2 = \frac{1}{2}\bar{I}(9\pi)$$

$$U_{1\to 2} = -1800 \text{ ft} \cdot \text{lb}$$

$$\frac{1}{2}\bar{I}(10\pi)^2 - 1800 = \frac{1}{2}\bar{I}(9\pi)^2$$

(*a*) *Required moment of inertia.*

$$\bar{I} = \frac{2(1800)}{\pi^2(100-81)} = 19.198 \text{ lb} \cdot \text{ft} \cdot \text{s}^2$$

$\bar{I} = 19.20 \text{ lb} \cdot \text{ft} \cdot \text{s}^2$ ◀

(*b*) *Number of revolution between each punching.*

Definition of work: $U_{2\to 1} = M\theta$:

$$1800 \text{ ft} \cdot \text{lb} = (25 \text{ lb} \cdot \text{ft})\theta$$

$$\theta = 72 \text{ rad} = 11.459 \text{ rev}$$

$\theta = 11.46 \text{ rev}$ ◀

PROBLEM 17.6

The flywheel of a punching machine has a mass of 300 kg and a radius of gyration of 600 mm. Each punching operation requires 2500 J of work. (*a*) Knowing that the speed of the flywheel is 300 rpm just before a punching, determine the speed immediately after the punching. (*b*) If a constant 25-N · m couple is applied to the shaft of the flywheel, determine the number of revolutions executed before the speed is again 300 rpm.

SOLUTION

Moment of inertia.

$$I = mk^2 = (300\text{ kg})(0.6\text{ m})^2 = 108\text{ kg}\cdot\text{m}^2$$

Kinetic energy. *Position 1.*

$$\omega_1 = 300\text{ rpm} = 10\pi\text{ rad/s}$$

$$T_1 = \frac{1}{2}I\omega_1^2 = \frac{1}{2}(108)(10\pi)^2 = 53.296\times 10^3\text{ J}$$

Position 2.

$$T_2 = \frac{1}{2}I\omega_2^2 = 54\omega_2^2$$

Work.

$$U_{1\to 2} = -2500\text{ J}$$

Principle of work and energy for punching.

$$T_1 + U_{1\to 2} = T_2: \quad 53.296\times 10^3 - 2500 = 54\omega_2^2$$

(*a*)

$$\omega_2^2 = 940.66$$

$$\omega_2 = 30.67\text{ rad/s} \qquad \omega_2 = 293\text{ rpm} \blacktriangleleft$$

Principle of work and energy for speed recovery.

$$T_2 + U_{2\to 1} = T_1$$

$$U_{2\to 1} = 2500\text{ J}$$

$$M = 25\text{ N}\cdot\text{m}$$

$$U_{2\to 1} = M\theta \quad 2500 = 25\theta \qquad \theta = 100\text{ rad}$$

(*b*)

$$\theta = 15.92\text{ rev} \blacktriangleleft$$

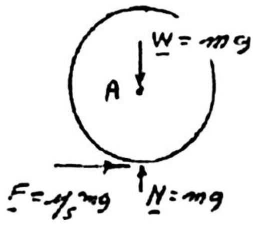
PROBLEM 17.7

Disk A, of weight 10 lb and radius $r = 6$ in., is at rest when it is placed in contact with belt BC, which moves to the right with a constant speed $v = 40$ ft/s. Knowing that $\mu_k = 0.20$ between the disk and the belt, determine the number of revolutions executed by the disk before it attains a constant angular velocity.

SOLUTION



Work of external friction force on disk A.

Only force doing work is F. Since its moment about A is $M = rF$, we have

$$\begin{aligned} U_{1\to 2} &= M\theta \\ &= rF\theta \\ &= r(\mu_k mg)\theta \end{aligned}$$

Kinetic energy of disk A.

Angular velocity becomes constant when $\omega_2 = \dfrac{v}{r}$

$$T_1 = 0$$

$$\begin{aligned} T_2 &= \frac{1}{2}\bar{I}\omega_2^2 \\ &= \frac{1}{2}\left(\frac{1}{2}mr^2\right)\left(\frac{v}{r}\right)^2 \\ &= \frac{mv^2}{4} \end{aligned}$$

Principle of work and energy for disk A.

$$T_1 + U_{1-2} = T_2: \quad 0 + r\mu_k mg\theta = \frac{mv^2}{4}$$

Angle change $\qquad \theta = \dfrac{v^2}{4r\mu_k g}\text{ rad} \qquad \theta = \dfrac{v^2}{8\pi r\mu_k g}\text{ rev}$

Data:

$$r = 0.5 \text{ ft}$$
$$\mu_k = 0.20$$
$$v = 40 \text{ ft/s}$$

$$\theta = \frac{(40 \text{ ft/s})^2}{8\pi(0.5 \text{ ft})(0.20)(32.2 \text{ ft/s}^2)}$$

$\theta = 19.77$ rev ◀

PROBLEM 17.13

The gear train shown consists of four gears of the same thickness and of the same material; two gears are of radius r, and the other two are of radius nr. The system is at rest when the couple $\mathbf{M}_0$ is applied to shaft C. Denoting by I_0 the moment of inertia of a gear of radius r, determine the angular velocity of shaft A if the couple $\mathbf{M}_0$ is applied for one revolution of shaft C.

SOLUTION

Mass and moment of inertia:

For a disk of radius r and thickness t: $\quad m = \rho(\pi r^2)t = \rho\pi t r^2$

$$\bar{I}_0 = \frac{1}{2}mr^2 = \frac{1}{2}(\rho\pi t r^2)r^2 = \frac{1}{2}\rho\pi t r^4$$

For a disk of radius nr and thickness t, $\quad \bar{I} = \frac{1}{2}\rho\pi t(nr)^4 \qquad \bar{I} = n^4\bar{I}_0$

Kinematics: If for shaft A we have ω_A ↻

Then, for shaft B we have $\omega_B = \omega_A/n$ ↺

And, for shaft C we have $\omega_C = \omega_A/n^2$ ↻

Principle of work-energy:

Couple M_0 applied to shaft C for one revolution. $\theta = 2\pi$ radians, $\quad T_1 = 0,$

$$U_{1-2} = M_0\theta = M_0(2\pi \text{ radians}) = 2\pi M_0$$

$$T_2 = \frac{1}{2}(\bar{I}_{\text{shaft }A})w_A^2 + \frac{1}{2}(\bar{I}_{\text{shaft }B})\omega_B^2 + \frac{1}{2}(\bar{I}_{\text{shaft }C})\omega_C^2$$

$$= \frac{1}{2}\bar{I}_0 w_A^2 + \frac{1}{2}(\bar{I}_0 + n^4\bar{I}_0)\left(\frac{\omega_A}{n}\right)^2 + \frac{1}{2}(n^4\bar{I}_0)\left(\frac{\omega_A}{n^2}\right)^2$$

$$= \frac{1}{2}\bar{I}_0\omega_A^2\left(n^2 + 2 + \frac{1}{n^2}\right)$$

$$= \frac{1}{2}\bar{I}_0\omega_A^2\left(n + \frac{1}{n}\right)^2$$

$$T_1 + U_{1-2} = T_2: \quad 0 + 2\pi M_0 = \frac{1}{2}\bar{I}_0\omega_A^2\left(n + \frac{1}{n}\right)^2$$

Angular velocity. $\quad \omega_A^2 = \dfrac{4\pi M_0}{\bar{I}_0}\dfrac{1}{\left(n + \frac{1}{n}\right)^2} \qquad \omega_A = \dfrac{2n}{n^2 + 1}\sqrt{\dfrac{\pi M_0}{\bar{I}_0}}$ ◀

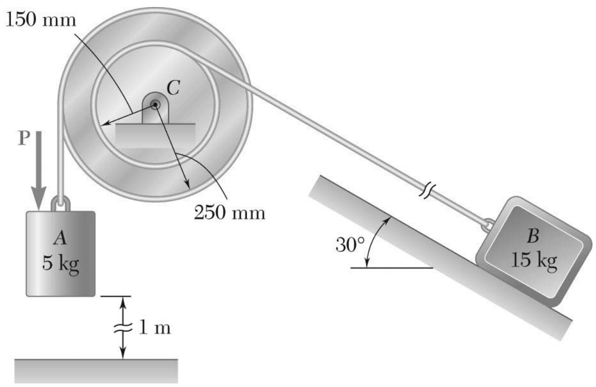
PROBLEM 17.14



The double pulley shown has a mass of 15 kg and a centroidal radius of gyration of 160 mm. Cylinder *A* and block *B* are attached to cords that are wrapped on the pulleys as shown. The coefficient of kinetic friction between block *B* and the surface is 0.2. Knowing that the system is at rest in the position shown when a constant force $P = 200$ N is applied to cylinder *A*, determine (*a*) the velocity of cylinder *A* as it strikes the ground, (*b*) the total distance that block *B* moves before coming to rest.

SOLUTION

Kinematics. Let r_A be the radius of the outer pulley and r_B that of the inner pulley.

$$v_A = r_A\omega_C \qquad v_B = r_B\omega_C = \frac{r_B}{r_A}v_A$$

$$s_A = r_A\theta_C \qquad s_B = \frac{r_B}{r_A}s_A$$

Use the principle of work and energy with position 1 being the initial rest position and position 2 being when cylinder *A* strikes the ground.

$$T_1 + U_{1\to 2} = T_2:$$

where $$T_1 = 0$$

and $$T_2 = \frac{1}{2}m_A v_A^2 + \frac{1}{2}m_B v_B^2 + \frac{1}{2}\bar{I}_C\omega_C^2$$

with $\quad m_A = 5\text{ kg},\quad m_B = 15\text{ kg},\quad \bar{I}_C = m_C\bar{k}_C^2 = (15\text{ kg})(0.160\text{ m})^2 = 0.384\text{ kg}\cdot\text{m}^2$

$$\begin{aligned}
T_2 &= \frac{1}{2}\left[m_A + \frac{m_B r_B^2}{r_A^2} + \frac{\bar{I}_C}{r_A^2}\right]v_A^2 \\
&= \frac{1}{2}\left[5\text{ kg} + \frac{(15\text{ kg})(0.150\text{ m})^2}{(0.250\text{ m})^2} + \frac{0.384\text{ kg}\cdot\text{m}^2}{(0.250\text{ m})^2}\right]v_A^2 \\
&= (8.272\text{ kg})v_A^2
\end{aligned}$$

Principle of work and energy applied to the system consisting of blocks *A* and *B* and the double pulley *C*.

Work. $\qquad U_{1\to 2} = Ps_A + m_A g\, s_A - F_F s_B - m_B g\, s_B \sin 30°$

where $\qquad s_A = 1\text{ m}$

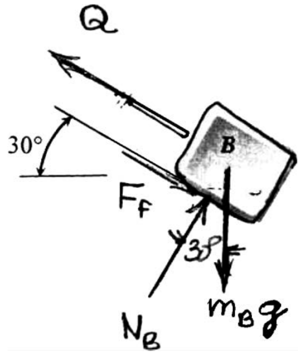
PROBLEM 17.14 (Continued)

and $$s_B = \frac{r_B}{r_A} s_A = \frac{0.150 \text{ m}}{0.250 \text{ m}}(1 \text{ m}) = 0.6 \text{ m}$$

To find F_f use the free body diagram of block B.



$$\measuredangle 60° \; \Sigma F = 0: \quad N_B - m_B g\cos 30° = 0$$

$$N_B = m_B g\cos 30° = (15 \text{ kg})(9.81 \text{ m/s})\cos 30° = 127.44 \text{ N}$$

$$F_f = \mu_k N_B = (0.2)(127.44 \text{ N}) = 25.487 \text{ N}$$

$$\begin{aligned} U_{1\to 2} &= (200 \text{ N})(1 \text{ m}) + (5 \text{ kg})(9.81 \text{ m/s}^2)(1 \text{ m}) \\ &\quad - (25.487 \text{ N})(0.6 \text{ m}) - (15 \text{ kg})(9.81 \text{ m/s}^2)(0.6 \text{ m})\sin 30° \\ &= 189.613 \text{ J} \end{aligned}$$

Work-energy: $0 + 189.613 \text{ J} = (8.272 \text{ kg})v_A^2$

(*a*) *Velocity of A.* $v_A = 4.7877 \text{ m/s}$ $\qquad \mathbf{v}_A = 4.79 \text{ m/s} \uparrow$ ◀

when the cylinder strikes the ground,

$$v_B = \frac{r_B}{r_A} v_A = \frac{0.150 \text{ m}}{0.250 \text{ m}}(4.7877 \text{ m/s}) = 2.8726 \text{ m/s}$$

$$\omega_C = \frac{v_A}{r_A} = \frac{4.7877 \text{ m/s}}{0.250 \text{ m}} = 19.1508 \text{ rad/s}$$

After the cylinder strikes the ground use the principle of work and energy applied to a system consisting of block B and double pulley C.

Let T_3 be its kinetic energy when A strikes the ground.

$$\begin{aligned} T_3 &= \frac{1}{2} m_B v_B^2 + \frac{1}{2}\bar{I}_C \omega_C^2 \\ &= \frac{1}{2}(15 \text{ kg})(2.8726 \text{ m/s})^2 + \frac{1}{2}(0.384 \text{ kg}\cdot\text{m}^2)(19.1508 \text{ rad/s})^2 \\ &= 132.305 \text{ J} \end{aligned}$$

When the system comes to rest, $T_4 = 0$

$$\begin{aligned} U_{3\to 4} &= -(25.487 \text{ N})s'_B - (15 \text{ kg})(9.81 \text{ m/s}^2)(s'_B \sin 30°) \\ &= -(99.062 \text{ N})s'_B \end{aligned}$$

where s'_B is the additional travel of block B.

$$T_3 + U_{3\to 4} = T_4: \quad 132.305 \text{ J} - (99.062 \text{ N})s'_B = 0$$

$$s'_B = 1.3356 \text{ m}$$

(*b*) *Total distance:* $\qquad s_B + s'_B = 1.936 \text{ m}$ ◀

PROBLEM 17.15

Gear A has a mass of 1 kg and a radius of gyration of 30 mm; gear B has a mass of 4 kg and a radius of gyration of 75 mm; gear C has a mass of 9 kg and a radius of gyration of 100 mm. The system is at rest when a couple $\mathbf{M}_0$ of constant magnitude 4 N · m is applied to gear C. Assuming that no slipping occurs between the gears, determine the number of revolutions required for disk A to reach an angular velocity of 300 rpm.

SOLUTION

Moments of inertia: $\bar{I} = mk^2$

Gear A: $I_A = (1\text{ kg})(0.030\text{ m})^2 = 0.9\times10^{-3}\text{ kg}\cdot\text{m}^2$

Gear B: $I_B = (4\text{ kg})(0.075\text{ m})^2 = 22.5\times10^{-3}\text{ kg}\cdot\text{m}^2$

Gear C: $I_C = (9\text{ kg})(0.100\text{ m})^2 = 90\times10^{-3}\text{ kg}\cdot\text{m}^2$

Let r_A be the radius of gear A, r_1 the outer radius of gear B, r_2 the inner radius of gear B, and r_C the radius of gear C.

$$r_A = 50\text{ mm},\quad r_1 = 100\text{ mm},\quad r_2 = 50\text{ mm},\quad r_C = 150\text{ mm}$$

At the contact point between gears A and B,

$$r_1\omega_B = r_A\omega_A:\quad \omega_B = \frac{r_A}{r_1}\omega_A = 0.5\omega_A$$

At the contact point between gear B and C.

$$r_C\omega_C = r_2\omega_B:\quad \omega_C = \frac{r_2}{r_C}\omega_B = 0.33333\omega_B$$

$$\omega_C = 0.16667\omega_A$$

Kinetic energy:

$$T = \frac{1}{2}I_A\omega_A^2 + \frac{1}{2}I_B\omega_B^2 + \frac{1}{2}I_C\omega_C^2$$

$$T = \frac{1}{2}[0.9\times10^{-3}\omega_A^2 + (22.5\times10^{-3})(0.5\omega_A)^2 + (90\times10^{-3})(0.16667\omega_A)^2]$$

$$= (4.5125\times10^{-3}\text{ kg}\cdot\text{m}^2)\omega_A^2$$

PROBLEM 17.19 (Continued)

Gravity:

$$V_g = Wh = 0$$

$$V_2 = V_e + V_g$$

$$= 0.9375 \text{ lb}\cdot\text{ft}$$

Kinetic energy:

$$\bar{v}_2 = r\omega_2 = \left(\frac{7}{12}\text{ ft}\right)\omega_2$$

$$\bar{I} = \frac{1}{12}mL^2 = \frac{1}{12}\left(\frac{9 \text{ lb}}{32.2}\right)(2 \text{ ft})^2 = 0.093168 \text{ slug}\cdot\text{ft}^2$$

$$T_2 = \frac{1}{2}m\bar{v}_2^2 + \frac{1}{2}\bar{I}\,\omega_2^2$$

$$= \frac{1}{2}\left(\frac{9 \text{ lb}}{32.2}\right)\left(\left(\frac{7}{12}\text{ ft}\right)\omega_2\right)^2 + \frac{1}{2}(0.093168)\omega_2^2$$

$$T_2 = 0.094138\omega_2^2$$

Conservation of energy:

$$T_1 + V_1 = T_2 + V_2$$

$$0 + 2.9382 = 0.094138\omega_2^2 + 0.9375$$

$$\omega_2^2 = 21.253$$

$$\omega_2 = 4.6101 \text{ rad/s}$$

$\boldsymbol{\omega}_2 = 4.61$ rad/s ↻ ◀

PROBLEM 17.20

A 160-lb gymnast is executing a series of full-circle swings on the horizontal bar. In the position shown he has a small and negligible clockwise angular velocity and will maintain his body straight and rigid as he swings downward. Assuming that during the swing the centroidal radius of gyration of his body is 1.5 ft, determine his angular velocity and the force exerted on his hands after he has rotated through (*a*) 90°, (*b*) 180°.

SOLUTION

Position 1. (*Directly above the bar*).

Elevation: $h_1 = 3.5$ ft

Potential energy: $V_1 = Wh_1 = (160 \text{ lb})(3.5 \text{ ft}) = 560 \text{ ft} \cdot \text{lb}$

Speeds: $\omega_1 = 0, \ \bar{v}_1 = 0$

Kinetic energy: $T_1 = 0$

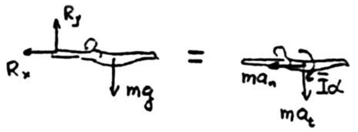
(*a*) *Position 2.* (*Body at level of bar after rotating* 90°).

Elevation: $h_2 = 0.$

Potential energy: $V_2 = 0$

Speeds: $\bar{v}_2 = 3.5\omega_2.$

Kinetic energy:
$$T_2 = \frac{1}{2}m\bar{v}_2^2 + \frac{1}{2}mk^2\omega_2^2$$
$$T_2 = \frac{1}{2}\left(\frac{160}{32.2}\right)(3.5\omega_2)^2 + \frac{1}{2}\left(\frac{160}{32.2}\right)(1.5)^2\omega_2^2$$
$$= 36.025\omega_2^2$$



Principle of conservation of energy.

$$T_1 + V_1 = T_2 + V_2: \quad 0 + 560 = 36.025\omega_2^2$$

$$\omega_2^2 = 15.545$$

$\omega_2 = 3.94$ rad/s ↻ ◀

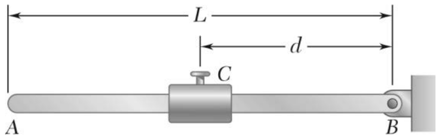
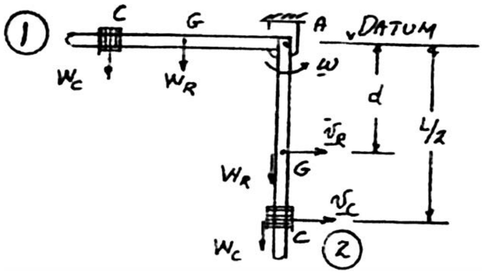
PROBLEM 17.21



A collar with a mass of 1 kg is rigidly attached at a distance $d = 300$ mm from the end of a uniform slender rod AB. The rod has a mass of 3 kg and is of length $L = 600$ mm. Knowing that the rod is released from rest in the position shown, determine the angular velocity of the rod after it has rotated through 90°.

SOLUTION



Kinematics.

Rod $\quad v_R = \dfrac{L}{2}\omega$

Collar $\quad v_C = d\omega$

Position 1. $\quad \omega = 0$

$$T_1 = 0 \quad V_1 = 0$$

Position 2.

$$T_2 = \frac{1}{2}m_R\bar{v}_R^2 + \frac{1}{2}\bar{I}_R\omega^2 + \frac{1}{2}m_C v_C^2$$

$$= \frac{1}{2}m_R\left(\frac{L}{2}\omega\right)^2 + \frac{1}{2}\left(\frac{1}{12}m_R L^2\right)\omega^2 + \frac{1}{2}m_C d^2\omega^2$$

$$= \frac{1}{6}m_R L^2\omega^2 + \frac{1}{2}m_C d^2\omega^2$$

$$V_2 = -W_C d - W_R\frac{L}{2}$$

$$T_1 + V_1 = T_2 + V_2: \quad 0 + 0 = \left(\frac{1}{6}m_R L^2 + \frac{1}{2}m_C d^2\right)\omega^2 - W_C d - W_R\frac{L}{2}$$

$$\omega^2 = \frac{3(2W_C d + W_C L)}{3m_C d^2 + m_R L^2} = \frac{3g(2m_C d + m_R L)}{3m_C d^2 + m_R L^2} \qquad (1)$$

Data: $\quad m_C = 1\text{ kg}, \quad d = 0.3\text{ m}, \quad m_R = 3\text{ kg}, \quad L = 0.6\text{ m}$

From Eq. (1),

$$\omega^2 = 3(9.81)\left[\frac{(2)(1)(0.3) + 3(0.6)}{3(1)(0.3)^2 + 3(0.6)^2}\right]$$

$$= 52.32$$

$\bar{\boldsymbol{\omega}} = 7.23$ rad/s ↻ ◀

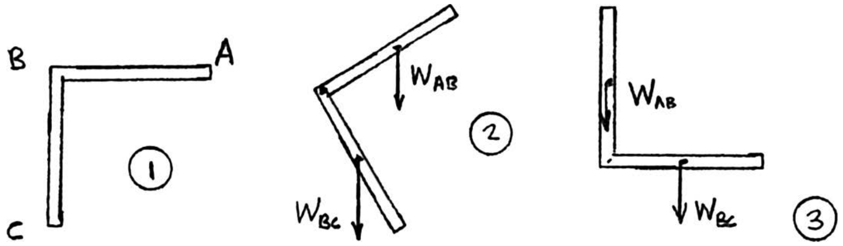
PROBLEM 17.23

Two identical slender rods AB and BC are welded together to form an L-shaped assembly. The assembly is pressed against a spring at D and released from the position shown. Knowing that the maximum angle of rotation of the assembly in its subsequent motion is 90° counterclockwise, determine the magnitude of the angular velocity of the assembly as it passes through the position where rod AB forms an angle of 30° with the horizontal.

SOLUTION

Moment of inertia about B.

$$I_B = \frac{1}{3}m_{AB}l^2 + \frac{1}{3}m_{BC}l^2$$



Position 2.

$$\theta = 30°$$

$$V_2 = W_{AB}(h_{AB})_2 + W_{BC}(h_{BC})_2$$

$$= W_{AB}\frac{l}{2}\sin 30° + W_{BC}\left(-\frac{l}{2}\cos 30°\right)$$

$$T_2 = \frac{1}{2}I_B\omega_2^2 = \frac{1}{6}(m_{AB} + m_{BC})l^2\omega_2^2$$

Position 3.

$$\theta = 90°$$

$$V_3 = W_{AB}\frac{l}{2} \quad T_3 = 0$$

Conservation of energy.

$$T_2 + V_2 = T_3 + V_3:$$

$$\frac{1}{6}(m_{AB} + m_{BC})l^2\omega_2^2 + W_{AB}\frac{l}{2}\sin 30° - W_{BC}\frac{l}{2}\cos 30° = 0 + W_{AB}\frac{l}{2}$$

$$\omega_2^2 = \frac{3}{l}\cdot\frac{W_{AB}(1-\sin 30°) + W_{BC}\cos 30°}{m_{AB} + m_{BC}}$$

$$= \frac{3}{2}\frac{g}{l}[1 - \sin 30° + \cos 30°]$$

$$= 2.049\frac{g}{l} = 2.049\frac{9.81}{0.4} = 50.25 \qquad \omega_2 = 7.09 \text{ rad/s} \blacktriangleleft$$

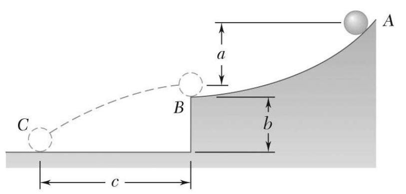
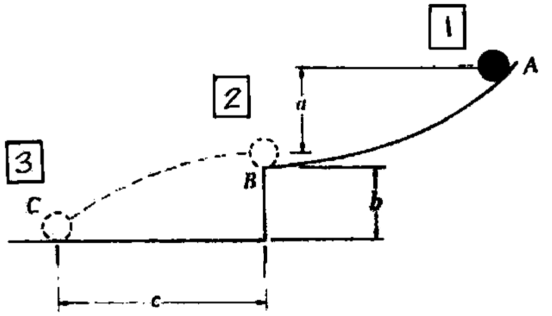
PROBLEM 17.28



A small sphere of mass m and radius r is released from rest at A and rolls without sliding on the curved surface to Point B where it leaves the surface with a horizontal velocity. Knowing that a = 1.5 m and b = 1.2 m, determine (a) the speed of the sphere as it strikes the ground at C, (b) the corresponding distance c.

SOLUTION



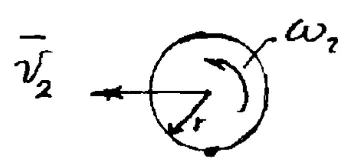
Work: $U_{1\to 2} = mga$

Kinetic energy: $T_1 = 0$

Rolling motion at position 2. $\bar{v}_2 = r\omega$ or $60\omega = \frac{v}{r}$

$$T_2 = \frac{1}{2}m\bar{v}^2 + \frac{1}{2}I\omega^2$$

$$= \frac{1}{2}m\bar{v}^2 + \frac{1}{2}\left(\frac{2}{5}mr^2\right)\left(\frac{v}{r}\right)^2 = \frac{7}{10}m\bar{v}^2$$



Principle of work and energy.

$$T_1 + U_{1\to 2} = T_2:\quad 0 + mga = \frac{7}{10}m\bar{v}^2$$

$$\bar{v}^2 = \frac{10ga}{7} = \frac{(10)(9.81\text{ m/s}^2)(1.5\text{ m})}{7} = 21.021\text{ m/s}^2$$

$$\bar{v} = 4.5849\text{ m/s}$$

For path B to C the motion is projectile motion. Let $t = 0$ at Point B. Let $y = 0$ at Point C.

Vertical motion: $v_y = (v_y)_0 - gt = -gt$

$$y = y_0 + (v_y)_0 t - \frac{1}{2}gt^2$$

At Point C, $0 = b + 0 - \frac{1}{2}gt_C^2$

$$t_C = \sqrt{\frac{2b}{g}} = \sqrt{\frac{(2)(1.2\text{ m})}{9.81\text{ m/s}^2}} = 0.49462\text{ s}$$

$$(v_y)_C = -gt_C = -(9.81\text{ m/s}^2)(0.49462\text{ s}) = -4.8522\text{ m/s}$$

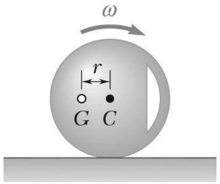
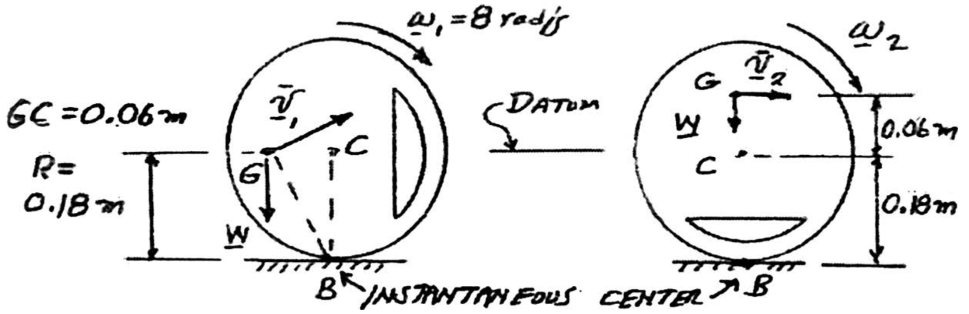
PROBLEM 17.29



The mass center G of a 3-kg wheel of radius $R = 180$ mm is located at a distance r = 60 mm from its geometric center C. The centroidal radius of gyration of the wheel is $\bar{k} = 90$ mm. As the wheel rolls without sliding, its angular velocity is observed to vary. Knowing that $\omega = 8$ rad/s in the position shown, determine (*a*) the angular velocity of the wheel when the mass center G is directly above the geometric center C, (*b*) the reaction at the horizontal surface at the same instant.

SOLUTION



$$\bar{v}_1 = (BG)\omega_1$$
$$= \sqrt{(0.18)^2 + (0.06)^2}(8)$$
$$= 8\sqrt{0.036} \text{ m/s}$$
$$\bar{v}_2 = 0.24\omega_2$$
$$m = 3 \text{ kg}$$
$$\bar{k} = 0.09 \text{ m}$$

Position 1.

$$V_1 = 0$$
$$T_1 = \frac{1}{2}m\bar{v}_1^2 + \frac{1}{2}\bar{I}\omega_1^2$$
$$= \frac{1}{2}(3)(8\sqrt{0.036})^2 + \frac{1}{2}(3)(0.09)^2(8)^2$$
$$= 4.2336 \text{ J}$$

Position 2.

$$V_2 = Wh$$
$$= mgh$$
$$= (3)(9.81)(0.06)$$
$$= 1.7658 \text{ J}$$
$$T_2 = \frac{1}{2}m\bar{v}_2^2 + \frac{1}{2}\bar{I}\omega_2^2$$
$$= \frac{1}{2}(3)(0.24\omega_2)^2 + \frac{1}{2}(3)(0.09)^2\omega_2^2$$
$$= 0.09855\omega_2^2$$

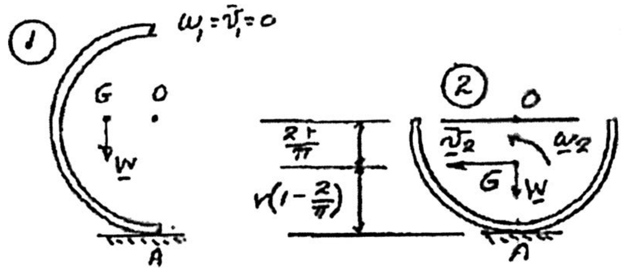
PROBLEM 17.30

A half section of pipe of mass m and radius r is released from rest in the position shown. Knowing that the pipe rolls without sliding, determine (*a*) its angular velocity after it has rolled through 90°, (*b*) the reaction at the horizontal surface at the same instant. [*Hint:* Note that $GO = 2r/\pi$ and that, by the parallel-axis theorem, $\bar{I} = mr^2 - m(GO)^2$.]

SOLUTION

Position 1. $\omega_1 = 0 \quad v_1 = 0 \quad T_1 = 0$



Position 2. Kinematics: $\bar{v}_2 = (AG)\omega_2 = r\left(1 - \dfrac{2}{\pi}\right)\omega_2$

Moment of inertia: $\bar{I} = mr^2 - m(0.6)^2 = mr^2 - m\left(\dfrac{2r}{\pi}\right)^2 = mr^2\left(1 - \dfrac{4}{\pi^2}\right)$

Kinetic energy:

$$T_2 = \frac{1}{2}m\bar{v}_2^2 + \frac{1}{2}\bar{I}\omega_2^2$$

$$= \frac{1}{2}m\left(1 - \frac{2}{\pi}\right)^2 r^2\omega_2^2 + \frac{1}{2}mr^2\left(1 - \frac{4}{\pi^2}\right)\omega_2^2$$

$$= \frac{1}{2}mr^2\left[\left(1 - \frac{4}{\pi} + \frac{4}{\pi^2}\right) + \left(1 - \frac{4}{\pi^2}\right)\right]$$

$$= \frac{1}{2}mr^2\left(2 - \frac{4}{\pi}\right)$$

Work: $U_{1\to 2} = W(OG) = mg\dfrac{2r}{\pi} = \dfrac{2}{\pi}mgr$

Principle of work and energy:

$$T_1 + U_{1\to 2} = T_2$$

$$0 + mg\frac{2r}{\pi} = \frac{1}{2}mr^2\left(2 - \frac{4}{\pi}\right)\omega_2^2$$

$$\omega_2^2 = \frac{2}{\pi\left(1 - \frac{2}{\pi}\right)} \cdot \frac{g}{r} = 1.7519\frac{g}{r}$$

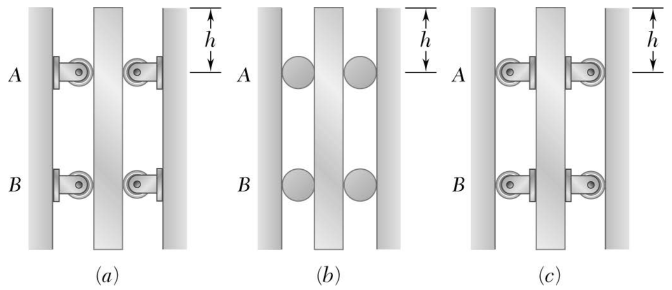
PROBLEM 17.34



A bar of mass $m = 5$ kg is held as shown between four disks each of mass $m' = 2$ kg and radius $r = 75$ mm. Knowing that the forces exerted on the disks are sufficient to prevent slipping and that the bar is released from rest, for each of the cases shown determine the velocity of the bar after it has moved through the distance h.

SOLUTION

Let $\mathbf{v}$ be the velocity of the bar $(\mathbf{v} = v\downarrow)$, $\overline{\mathbf{v}}'$ be the velocity of the mass center G of the upper left disk, $(\overline{\mathbf{v}}' = \overline{v}'\downarrow)$ and $\boldsymbol{\omega}$ be its angular velocity.

For all three arrangements, the magnitudes of mass center velocities are the same for all disks. Likewise, the angular speeds are the same for all disks.

Moment of inertia of one disk. $\quad \overline{I} = \frac{1}{2}m'r^2$

Kinetic energy. $\quad T = \frac{1}{2}mv^2 + 4\left[\frac{1}{2}m'(\overline{v}')^2 + \frac{1}{2}\overline{I}\omega^2\right]$

$$T = \frac{1}{2}(5)v^2 + 4\left[\frac{1}{2}(2)(\overline{v}')^2 + \frac{1}{2}\left(\frac{1}{2}\right)(2)r^2\omega^2\right]$$

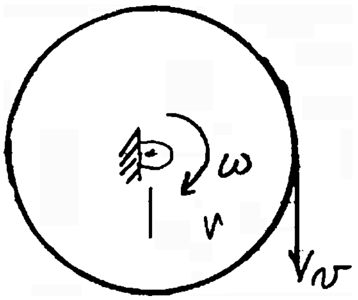
$$= 2.5v^2 + 4(\overline{v}')^2 + 2r^2\omega^2$$

Position 1. Initial at rest position. $\quad T_1 = 0$

Position 2. Bar has moved down a distance h. All the disks move down a distance h'.

Work $\quad U_{1\to 2} = mgh + 4m'gh' = 5gh + 8gh'$

Kinematics and kinetic energy for case (a).



The mass center of each disk is not moving.

$\overline{v}' = 0, \qquad h' = 0$

$\omega = \frac{v}{r} \qquad r\omega = v$

$T_{2a} = 2.5v^2 + 0 + 2v^2 = 4.5v^2$

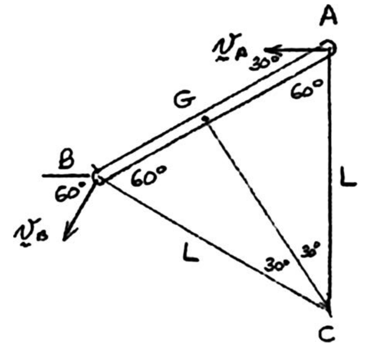
PROBLEM 17.36

The motion of the uniform rod AB is guided by small wheels of negligible mass that roll on the surface shown. If the rod is released from rest when $\theta = 0$, determine the velocities of A and B when $\theta = 30°$.

SOLUTION



Position 1. $\theta = 0$

$$v_A = v_B = 0$$
$$\omega = 0$$
$$T_1 = 0$$
$$V_1 = 0$$

Position 2. $\theta = 30°$

Kinematics. Locate the instantaneous center C. Triangle ABC is equilateral.

$$v_A = v_B = L\omega$$
$$v_G = L\omega \cos 30°$$

Moment of inertia. $\bar{I} = \frac{1}{12} ml^2$

Kinetic energy. $T_2 = \frac{1}{2} m v_G^2 + \frac{1}{2} \bar{I} \omega^2$: $T_2 = \frac{1}{2} m (L\omega \cos 30°)^2 + \frac{1}{2}\left(\frac{1}{12} mL^2\right)\omega^2$

$$= \frac{5}{12} ml^2 \omega^2$$

Potential energy. $V_2 = -mg\frac{L}{2}\sin 30° = -\frac{1}{4} mgL$

Conservation of energy.

$$T_1 + V_1 = T_2 + V_2: \quad 0 + 0 = \frac{5}{12} mL^2\omega^2 - \frac{1}{4} mgL$$

$$\omega^2 = 0.6\frac{g}{L}$$

$$\omega = 0.775\sqrt{\frac{g}{L}}$$

$$v_A = 0.775\sqrt{gL}$$

$$v_B = 0.775\sqrt{gL}$$

$\mathbf{v}_A = 0.775\sqrt{gL} \longleftarrow$ ◀

$\mathbf{v}_B = 0.775\sqrt{gL} \nearrow 60°$ ◀

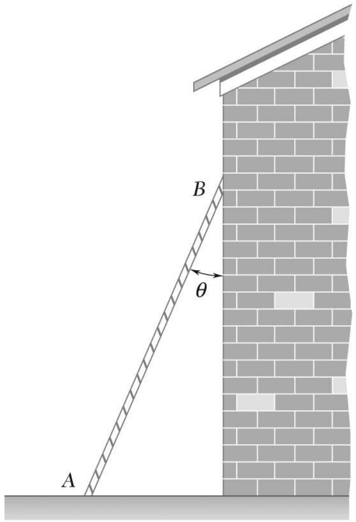
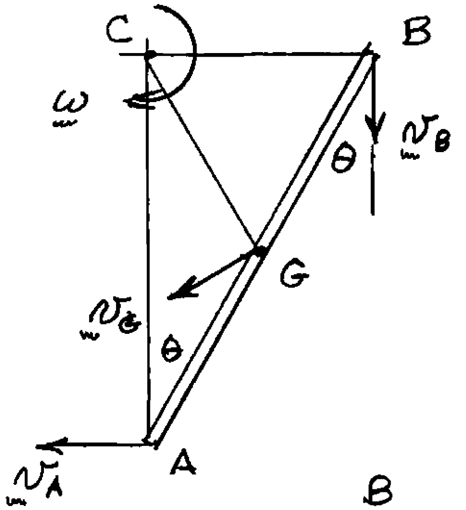
PROBLEM 17.37



A 5-m long ladder has a mass of 15 kg and is placed against a house at an angle $\theta = 20°$. Knowing that the ladder is released from rest, determine the angular velocity of the ladder and the velocity of A when $\theta = 45°$. Assume the ladder can slide freely on the horizontal ground and on the vertical wall.

SOLUTION



Kinematics:

Let $\mathbf{v}_A = v_A \longleftarrow$, $\mathbf{v}_B = v_B \downarrow$, and $\boldsymbol{\omega} = \omega \circlearrowright$. Locate the instantaneous center C by drawing AC perpendicular to $\mathbf{v}_A$ and BC perpendicular to $\mathbf{v}_B$. Triangle GCB is isosceles.

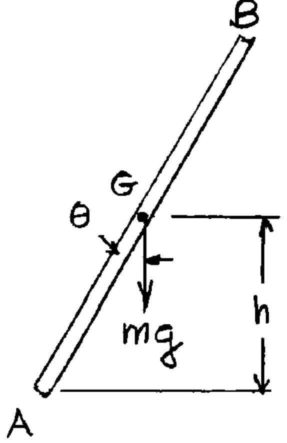
$GA = GB = GC = L/2$. The velocity of the mass center G is

$$\bar{v} = v_G = L\omega/2$$

Kinetic energy:

$$T = \frac{1}{2}m\bar{v}^2 + \frac{1}{2}\bar{I}\omega^2$$

$$= \frac{1}{2}\left(\bar{I} + \frac{1}{4}mL^2\right)\omega^2$$



Since the ladder can slide freely, the friction forces at A and B are zero.

Use the principle of conservation of energy.

$$T_1 + V_1 = T_2 + V_2:$$

Potential energy: Use the ground as the datum.

$$V = mgh$$

where

$$h = \frac{L}{2}\cos\theta$$

PROBLEM 17.41

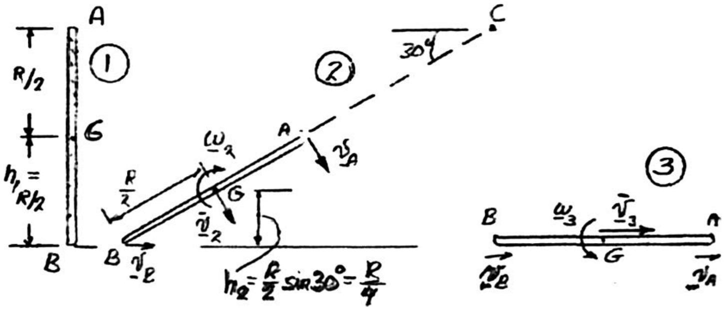
The motion of a slender rod of length R is guided by pins at A and B which slide freely in slots cut in a vertical plate as shown. If end B is moved slightly to the left and then released, determine the angular velocity of the rod and the velocity of its mass center (a) at the instant when the velocity of end B is zero, (b) as end B passes through Point D.

SOLUTION

The rod AB moves from *Position 1*, where it is nearly vertical, to *Position 2*, where $\mathbf{v}_B = 0$.

In *Position 2*, $\mathbf{v}_A$ is perpendicular to both CA and AB, so CAB is a straight line of length $2L$ and slope angle 30°.

In *Position 3* the end B passes through Point D.



Position 1: $\quad T_1 = 0 \qquad V_1 = Wh = mg\dfrac{R}{2}$

Position 2: Since instantaneous center is at B,

$$v_2 = \frac{1}{2}R\omega_2$$

$$T_2 = \frac{1}{2}m\bar{v}_2^2 + \frac{1}{2}\bar{I}\omega_2^2$$

$$= \frac{1}{2}m\left(\frac{1}{2}R\omega_2\right)^2 + \frac{1}{2}\left(\frac{1}{12}mR^2\right)\omega_2^2$$

$$= \frac{1}{6}mR^2\omega_2^2$$

$$V_2 = Wh_2 = mg\frac{R}{4}$$

Position 3: $\quad V_3 = 0$

Since both $\mathbf{v}_A$ and $\mathbf{v}_B$ are horizontal, $\omega_3 = 0$ (1)

$$T_3 = \frac{1}{2}m\bar{v}_2^2$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 17.44

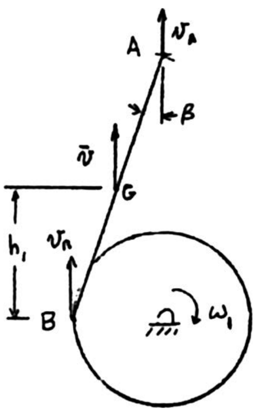
If in Problem 17.43 the angular velocity of the flywheel is to be the same in the position shown and when Point *B* is directly above *C*, determine the required value of its angular velocity in the position shown.

PROBLEM 17.43 The 4-kg rod *AB* is attached to a collar of negligible mass at *A* and to a flywheel at *B*. The flywheel has a mass of 16 kg and a radius of gyration of 180 mm. Knowing that in the position shown the angular velocity of the flywheel is 60 rpm clockwise, determine the velocity of the flywheel when Point *B* is directly below *C*.

SOLUTION

Moments of inertia.



Rod *AB*: $\bar{I}_{AB} = \frac{1}{12} m_{AB} L_{AB}^2$

$= \frac{1}{12}(4 \text{ kg})(0.72 \text{ m})^2$

$= 0.1728 \text{ kg} \cdot \text{m}^2$

Flywheel: $I_C = m\bar{k}^2$

$= (16 \text{ kg})(0.18 \text{ m})^2$

$= 0.5184 \text{ kg} \cdot \text{m}^2$

Position 1. As shown. $\boldsymbol{\omega} = \omega_1 \circlearrowright$

$\sin\beta = \frac{0.24}{0.72} \quad \beta = 19.471°$

$h_1 = \frac{1}{2}(0.72)\cos\beta = 0.33941 \text{ m}$

$V_1 = W_{AB} h_1$

$= (4)(9.81)(0.33941)$

$= 13.3185 \text{ J}$

Kinematics. $v_B = r\omega_1 = 0.24\omega_1$

Bar *AB* is in translation. $\omega_{AB} = 0, \quad \bar{v} = v_B$

$T_1 = \frac{1}{2} m_{AB} \bar{v}^2 + \frac{1}{2}\bar{I}_{AB}\omega_{AB}^2 + \frac{1}{2} I_C \omega_1^2$

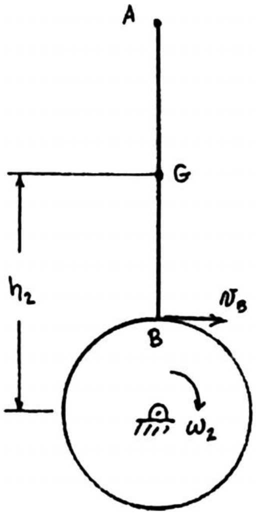
$= \frac{1}{2}(4)(0.24\omega_1)^2 + 0 + \frac{1}{2}(0.5184)\omega_1^2$

$= 0.3744\omega_1^2$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. If you are a student using this Manual, you are using it without permission.*

PROBLEM 17.44 (Continued)

Position 2. Point *B* is directly above *C*.



$$h_2 = \frac{1}{2}L_{AB} + r$$
$$= \frac{1}{2}(0.72) + 0.24$$
$$= 0.6 \text{ m}$$
$$V_2 = W_{AB}h_2$$
$$= (4)(9.81)(0.6)$$
$$= 23.544 \text{ J}$$

Kinematics. $$v_B = r\omega_2 = 0.24\omega_2$$

$$\omega_{AB} = \frac{v_B}{0.72} = 0.33333\omega_2$$
$$\bar{v} = \frac{1}{2}v_B = 0.12\omega_2$$
$$T_2 = \frac{1}{2}m_{AB}\bar{v}^2 + \frac{1}{2}\bar{I}_{AB}\omega_{AB}^2 + \frac{1}{2}I_C\omega_2^2$$
$$= \frac{1}{2}(4)(0.12\omega_2)^2 + \frac{1}{2}(0.1728)(0.33333\omega_2)^2 + \frac{1}{2}(0.5184)\omega_2^2$$
$$= 0.2976\omega_2^2$$

Conservation of energy. $T_1 + V_1 = T_2 + V_2$: $0.3744\omega_1^2 + 13.3135 = 0.2976\omega_2^2 + 23.544$

Angular speed data: $\omega_2 = \omega_1$

Then, $0.0760\omega_1^2 = +0.4105$

$\omega_1 = 11.602$ rad/s $\quad$ $\boldsymbol{\omega}_1 = 110.8$ rpm ↻ ◀

PROBLEM 17.45

The uniform rods AB and BC of masses 2.4 kg and 4 kg, respectively, and the small wheel at C is of negligible mass. If the wheel is moved slightly to the right and then released, determine the velocity of pin B after rod AB has rotated through 90°.

SOLUTION

Moments of inertia.

Rod AB: $$I_A = \frac{1}{3}m_{AB}L_{AB}^2 = \frac{1}{3}(2.4)(0.360)^2 = 0.10368 \text{ kg}\cdot\text{m}^2$$

Rod BC: $$\bar{I} = \frac{1}{12}m_{BC}L_{BC}^2 = \frac{1}{12}(4)(0.600)^2 = 0.1200 \text{ kg}\cdot\text{m}^2$$

Position 1. As shown with bar AB vertical. Point G is the midpoint of BC.

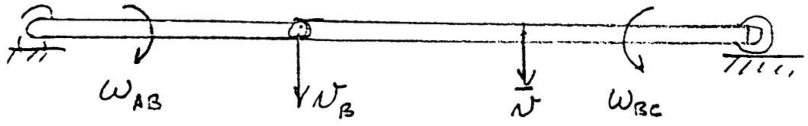
$$V_1 = m_{AB}gh_{AB} + m_{BC}gh_{BC} = (2.4)(9.81)(0.180) + (4)(9.81)(0.180) = 11.3011 \text{ J}$$

Rod BC is at rest. $\omega_{BC} = 0$

$$\bar{v} = v_G = v_B = v_C = 0 \qquad \omega_{AB} = \frac{v_B}{L_{AB}} = 0$$

$$T_1 = 0$$

Position 2. Rod AB is horizontal.



$$V_2 = 0$$

Kinematics. $$\omega_{AB} = \frac{v_B}{L_{AB}} = \frac{v_B}{0.360} \qquad \omega_{BC} = \frac{v_B}{L_{BC}} = \frac{v_B}{0.600} \qquad \bar{v} = \frac{1}{2}v_B$$

$$T_2 = \frac{1}{2}I_A\omega_{AB}^2 + \frac{1}{2}m_{BC}\bar{v}^2 + \frac{1}{2}\bar{I}\,\omega_{BC}^2$$

$$= \frac{1}{2}(0.10368)\left(\frac{v_B}{0.360}\right)^2 + \frac{1}{2}(4)\left(\frac{1}{2}v_B\right)^2 + \frac{1}{2}(0.1200)\left(\frac{v_B}{0.600}\right)^2$$

$$= 1.06667v_B^2$$

Conservation of energy. $T_1 + V_1 = T_2 + V_2$: $0 + 11.3011 = 1.06667v_B^2$

$v_B = 3.25$ m/s $\qquad\qquad \mathbf{v}_B = 3.25$ m/s ↓ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 17.46

The uniform rods AB and BC of masses 2.4 kg and 4 kg, respectively, and the small wheel at C is of negligible mass. Knowing that in the position shown the velocity of wheel C is 2 m/s to the right, determine the velocity of pin B after rod AB has rotated through 90°.

SOLUTION

Moments of inertia.

Rod AB: $$I_A = \frac{1}{3} m_{AB} L_{AB}^2 = \frac{1}{3}(2.4)(0.36)^2 = 0.10368 \text{ kg} \cdot \text{m}^2$$

Rod BC: $$\bar{I} = \frac{1}{12} m_{BC} L_{BC^2} = \frac{1}{12}(4)(0.600)^2 = 0.1200 \text{ kg} \cdot \text{m}^2$$

Position 1. As shown with rod AB vertical. Point G is the midpoint of BC.

$$\begin{aligned} V_1 &= W_{AB} h_{AB} + W_{BC} h_{BC} \\ &= (2.4)(9.81)(0.180) + (4)(9.81)(0.180) \\ &= 11.301 \text{ J} \end{aligned}$$

Kinematics: At the instant shown in Position 1,

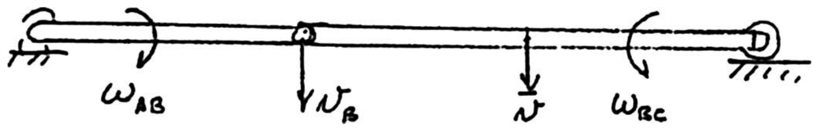
$$\omega_{BC} = 0$$

$$\bar{v} = v_G = v_B = v_C = 2 \text{ m/s}$$

$$\omega_{AB} = \frac{v_B}{L_{AB}} = \frac{2}{0.36} = 5.5556 \text{ rad/s}$$

$$\begin{aligned} T_1 &= \frac{1}{2} I_A \omega_{AB}^2 + \frac{1}{2} m_{BC} \bar{v}^2 + \frac{1}{2} I \omega_{BC}^2 \\ &= \frac{1}{2}(0.10368)(5.5556)^2 + \frac{1}{2}(4)(2)^2 + 0 \\ &= 9.6 \text{ J} \end{aligned}$$

Position 2. Rod AB is horizontal.



$$V_2 = 0$$

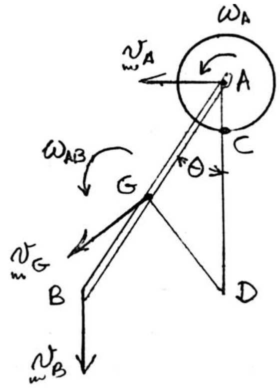
PROBLEM 17.47

The 80-mm-radius gear shown has a mass of 5 kg and a centroidal radius of gyration of 60 mm. The 4-kg rod *AB* is attached to the center of the gear and to a pin at *B* that slides freely in a vertical slot. Knowing that the system is released from rest when $\theta = 60°$, determine the velocity of the center of the gear when $\theta = 20°$.

SOLUTION



Kinematics. $\mathbf{v}_A = v_A \longleftarrow$

$\mathbf{v}_B = v_B \downarrow$

Point *D* is the instantaneous center of rod *AB*.

$$\omega_{AB} = \frac{v_A}{L\cos\theta}$$

$$v_B = (L\sin\theta)\omega_{AB} = v_A\tan\theta$$

$$v_G = \frac{L}{2}\omega_{AB} = \frac{v_A}{2\cos\theta}$$

Gear *A* effectively rolls without slipping, with Point *C* being the contact point.

$$v_C = 0$$

Angular velocity of gear $\omega_A = \dfrac{v_A}{r}.$

Potential energy: Use the level of the center of gear *A* as the datum.

$$V = -W_{AB}\left(\frac{L}{2}\cos\theta\right) = -\frac{1}{2}m_{AB}gL\cos\theta$$

Kinetic energy: $T = \dfrac{1}{2}m_A v_A^2 + \dfrac{1}{2}I_A\omega_A^2 + \dfrac{1}{2}m_{AB}v_\theta^2 + \dfrac{1}{2}\bar{I}_{AB}\omega_{AB}^2$

Masses and moments of inertia: $m_A = 5\text{ kg}, \quad m_{AB} = 4\text{ kg}$

$$I_A = m_A k^2 = (5)(0.060)^2 = 0.018\text{ kg}\cdot\text{m}^2$$

$$\bar{I}_{AB} = \frac{1}{12}m_{AB}L^2 = \frac{1}{12}(4)(0.320)^2 = 0.03413\text{ kg}\cdot\text{m}^2$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 17.64

A tape moves over the two drums shown. Drum A weighs 1.4 lb and has a radius of gyration of 0.75 in., while drum B weighs 3.5 lb and has a radius of gyration of 1.25 in. In the lower portion of the tape the tension is constant and equal to $T_A = 0.75$ lb. Knowing that the tape is initially at rest, determine (*a*) the required constant tension T_B if the velocity of the tape is to be $v = 10$ ft/s after 0.24 s, (*b*) the corresponding tension in the portion of tape between the drums.

SOLUTION

Kinematics. Drums A and B rotate about fixed axes. Let v be the tape velocity in ft/s.

$$v = r_A\omega_A = \frac{0.9}{12}\omega_A \qquad \omega_A = 13.3333v$$

$$v = r_B\omega_B = \frac{1.5}{12}\omega_B \qquad \omega_B = 8v$$

Moments of inertia.
$$\bar{I}_A = m_A\bar{k}_A^2 = \left(\frac{1.4}{32.2}\right)\left(\frac{0.75}{12}\right)^2 = 169.837\times10^{-6}\,\text{lb}\cdot\text{s}^2\cdot\text{ft}$$

$$\bar{I}_B = m_B\bar{k}_B^2 = \left(\frac{3.5}{32.2}\right)\left(\frac{1.25}{12}\right)^2 = 1.17942\times10^{-3}\,\text{lb}\cdot\text{s}^2\cdot\text{ft}$$

State 1. $t = 0 \qquad v = 0 \qquad \omega_A = \omega_B = 0$

State 2. $t = 0.24$ s, $\qquad v = 10$ ft/s

$$\omega_A = (13.3333)(10) = 133.333\text{ rad/s} \circlearrowright$$

$$\omega_B = (8)(10) = 80\text{ rad/s} \circlearrowleft$$

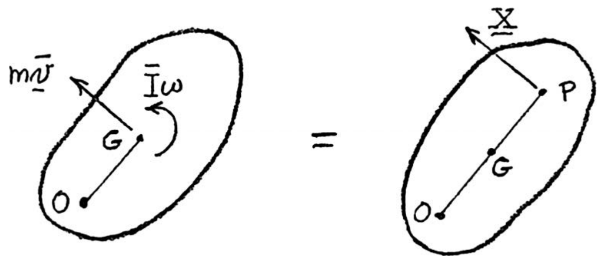
PROBLEM 17.65

Show that the system of momenta for a rigid slab in plane motion reduces to a single vector, and express the distance from the mass center G to the line of action of this vector in terms of the centroidal radius of gyration $\bar{k}$ of the slab, the magnitude $\bar{v}$ of the velocity of G, and the angular velocity ω.

SOLUTION



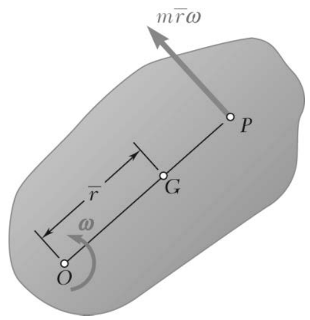
Syst. Momenta = Single Vector

Components parallel to $m\bar{\mathbf{v}}$: $m\bar{\mathbf{v}} = \mathbf{X}$ $\qquad \mathbf{X} = m\bar{\mathbf{v}}$ ◀

Moments about G: $\bar{I}\,\omega = (m\bar{v})\,d$

$$d = \frac{\bar{I}\,\omega}{m\bar{v}} = \frac{m\bar{k}^2\omega}{m\bar{v}} \qquad d = \frac{\bar{k}^2\omega}{\bar{v}} \blacktriangleleft$$

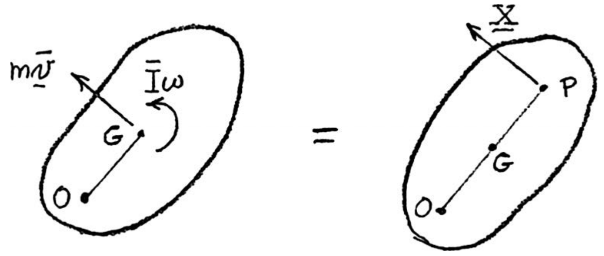
PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



PROBLEM 17.66

Show that, when a rigid slab rotates about a fixed axis through O perpendicular to the slab, the system of the momenta of its particles is equivalent to a single vector of magnitude $m\bar{r}\omega$, perpendicular to the line OG, and applied to a Point P on this line, called the *center of percussion*, at a distance $GP = \bar{k}^2/\bar{r}$ from the mass center of the slab.

SOLUTION



Kinematics. Point O is fixed. $\bar{v} = \bar{r}\omega$

System momenta.

Components parallel to $m\bar{\mathbf{v}}$: $X = m\bar{v} = m\bar{r}\omega$ $\qquad X = m\bar{r}\omega$ ◀

Moments about G: $(GP)X = \bar{I}\omega$

$$(GP)m\,r\,\omega = m\bar{k}^2\omega \qquad (GP) = \frac{\bar{k}^2}{\bar{r}} \blacktriangleleft$$

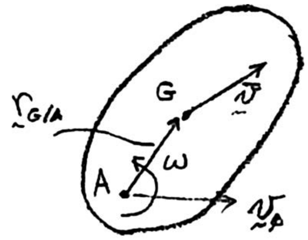
PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 17.67

Show that the sum $\mathbf{H}_A$ of the moments about a Point A of the momenta of the particles of a rigid slab in plane motion is equal to $I_A\omega$, where ω is the angular velocity of the slab at the instant considered and I_A the moment of inertia of the slab about A, if and only if one of the following conditions is satisfied: (*a*) A is the mass center of the slab, (*b*) A is the instantaneous center of rotation, (*c*) the velocity of A is directed along a line joining Point A and the mass center G.

SOLUTION

Kinematics.



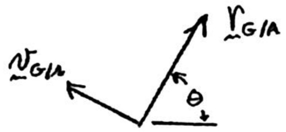
Let $\boldsymbol{\omega} = \omega\mathbf{k}$

and $\mathbf{r}_{G/A} = r_{G/A} \measuredangle\, \theta$

Then, $\mathbf{v}_{G/A} = \boldsymbol{\omega}\times\mathbf{r}_{G/A} = (\omega r_{G/A}) \measuredangle\, \beta$

where $\beta = \theta + 90°$

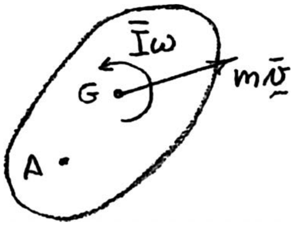
Also $\overline{\mathbf{v}} = \mathbf{v}_A + \mathbf{v}_{G/A}$



Define $\mathbf{h} = \mathbf{r}_{G/A} \times \mathbf{v}_{G/A}$

$$\mathbf{h} = (r_{G/A})(v_{G/A})\mathbf{k} = (r_{G/A})^2\omega\mathbf{k} = (r_{G/A})^2\boldsymbol{\omega}$$

System momenta. Moments about A:



$$\begin{aligned}\mathbf{H}_A &= \mathbf{r}_{G/A}\times m\overline{\mathbf{v}} + \overline{I}\boldsymbol{\omega}\\ &= \mathbf{r}_{G/A}\times m(\mathbf{v}_A + \mathbf{v}_{G/A}) + \overline{I}\,\omega\\ &= \mathbf{r}_{G/A}\times m\mathbf{v}_A + m\mathbf{r}_{G/A}\times\mathbf{v}_{G/A} + \overline{I}\boldsymbol{\omega}\\ &= \mathbf{r}_{G/A}\times m\mathbf{v}_A + m\mathbf{h} + \overline{I}\boldsymbol{\omega}\\ &= \mathbf{r}_{G/A}\times m\mathbf{v}_A + mr_{G/A}^2\boldsymbol{\omega} + \overline{I}\boldsymbol{\omega}\\ &= \mathbf{r}_{G/A}\times m\mathbf{v}_A + (m\,r_{G/A}^2 + \overline{I}\,)\,\boldsymbol{\omega}\end{aligned}$$

The first term on the right hand side is equal to zero if

(*a*) $\mathbf{r}_{G/A} = 0$ (A is the mass center)

or (*b*) $\mathbf{v}_A = 0$ (A is the instantaneous center of rotation)

or (*c*) $\mathbf{r}_{G/A}$ is perpendicular to $\mathbf{v}_A$.

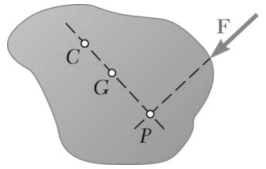
In the second term, $mr_{G/A}^2 + \overline{I} = I_A$ by the parallel axis theorem.

Thus, $\mathbf{H}_A = I_A\boldsymbol{\omega}$

when one or more of the conditions (*a*), (*b*) or (*c*) is satisfied.

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

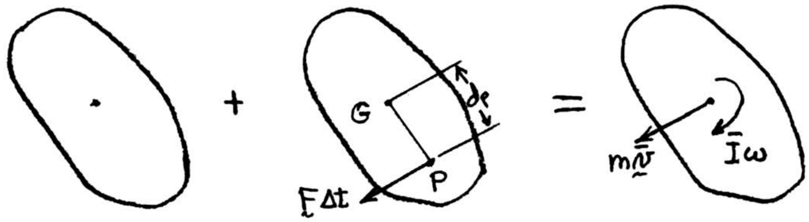
PROBLEM 17.68



Consider a rigid slab initially at rest and subjected to an impulsive force **F** contained in the plane of the slab. We define the *center of percussion P* as the point of intersection of the line of action of **F** with the perpendicular drawn from *G*. (*a*) Show that the instantaneous center of rotation *C* of the slab is located on line *GP* at a distance $GC = \bar{k}^2/GP$ on the opposite side of *G*. (*b*) Show that if the center of percussion were located at *C* the instantaneous center of rotation would be located at *P*.

SOLUTION

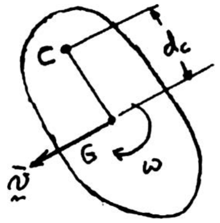
(*a*) Locate the instantaneous center *C* corresponding to center of percussion *P*. Let $d_P = GP$.



Syst. Momenta$_1$ + **Syst. Ext. Imp.**$_{1\to 2}$ = **Syst. Momenta**$_2$

Components parallel to $\mathbf{F}\Delta t$: $0 + F\Delta t = m\bar{v}$

Moments about *G*: $0 + d_P(F\Delta t) = \bar{I}\omega$



Eliminate $F\Delta t$ to obtain

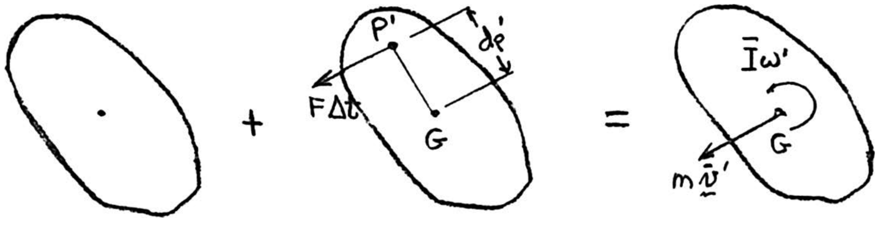
$$\frac{\bar{v}}{\omega} = \frac{\bar{I}}{md_P} = \frac{\bar{k}^2}{d_P}$$

Kinematics. Locate Point *C*. $GC = d_C = \dfrac{\bar{v}}{\omega} = \dfrac{\bar{k}^2}{d_P}$

$$GC = \frac{\bar{k}^2}{GP} \quad \blacktriangleleft$$

(*b*) Place the center of percussion at $P' = C$. Locate the corresponding instantaneous center C'. Let

$$d_{P'} = GP' = GC = d_C.$$



Syst. Momenta$_1$ + **Syst. Ext. Imp.**$_{1\to 2}$ = **Syst. Momenta**$_2$

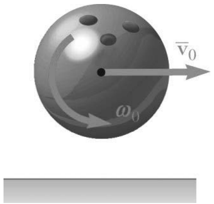
PROBLEM 17.78



A bowler projects an 8.5-in.-diameter ball weighing 16 lb along an alley with a forward velocity $\mathbf{v}_0$ of 25 ft/s and a backspin ω_0 of 9 rad/s. Knowing that the coefficient of kinetic friction between the ball and the alley is 0.10, determine (*a*) the time t_1 at which the ball will start rolling without sliding, (*b*) the speed of the ball at time t_1.

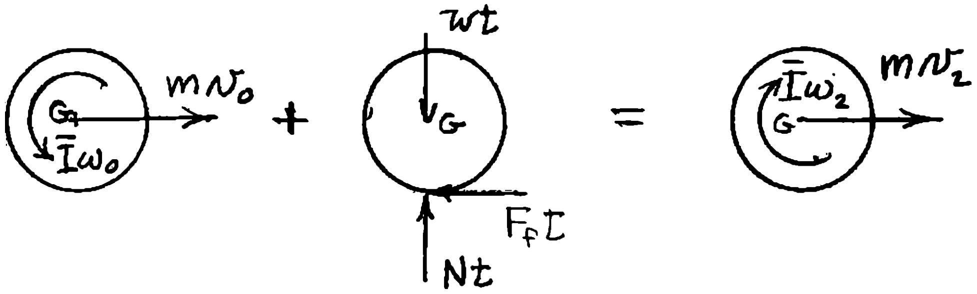
SOLUTION

Radius: $r = \frac{1}{2}d = \frac{1}{2}(8.5 \text{ in.}) = 4.25 \text{ in.} = 0.35417 \text{ ft}$

Mass: $m = \frac{W}{g} = \frac{16 \text{ lb}}{32.2 \text{ ft/s}^2} = 0.49689 \text{ lb} \cdot \text{s}^2/\text{ft}$

Moment of inertia: $\bar{I} = \frac{2}{5}mr^2 = \left(\frac{2}{5}\right)(0.49689)(0.35417)^2 = 0.02493 \text{ lb} \cdot \text{s}^2 \cdot \text{ft}$

Use the principle of impulse and momentum.



Syst. Momenta$_1$ + **Syst. Ext. Imp.**$_{1\to 2}$ = **Syst. Momenta**$_2$

$+\uparrow$: $Nt - Wt = 0 \qquad N = W = 16 \text{ lb}$

Friction force: $F_F = \mu_k N = (0.10)(16) = 1.6 \text{ lb.}$

$\xrightarrow{+}$: $mv_0 - F_F t = mv_2$

$$v_2 = v_0 - \frac{F_F t}{m} = 25 \text{ ft/s} - \frac{1.6t}{0.49689}$$
$$= 25 - 3.22t$$

$+\circlearrowright$ Moments about G: $\bar{I}\omega_0 - F_F tr = -\bar{I}\omega_2$

$$\omega_2 = \frac{F_F tr}{\bar{I}} - \omega_0 = \frac{(1.6t)(0.35417)}{0.02493} - 9$$
$$= 22.731t - 9$$

Slipping stops when $v_2 = r\omega_2$

PROBLEM 17.79

Four rectangular panels, each of length b and height $\frac{1}{2}b$, are attached with hinges to a circular plate of diameter $\sqrt{2}b$ and held by a wire loop in the position shown. The plate and the panels are made of the same material and have the same thickness. The entire assembly is rotating with an angular velocity ω_0 when the wire breaks. Determine the angular velocity of the assembly after the panels have come to rest in a horizontal position.

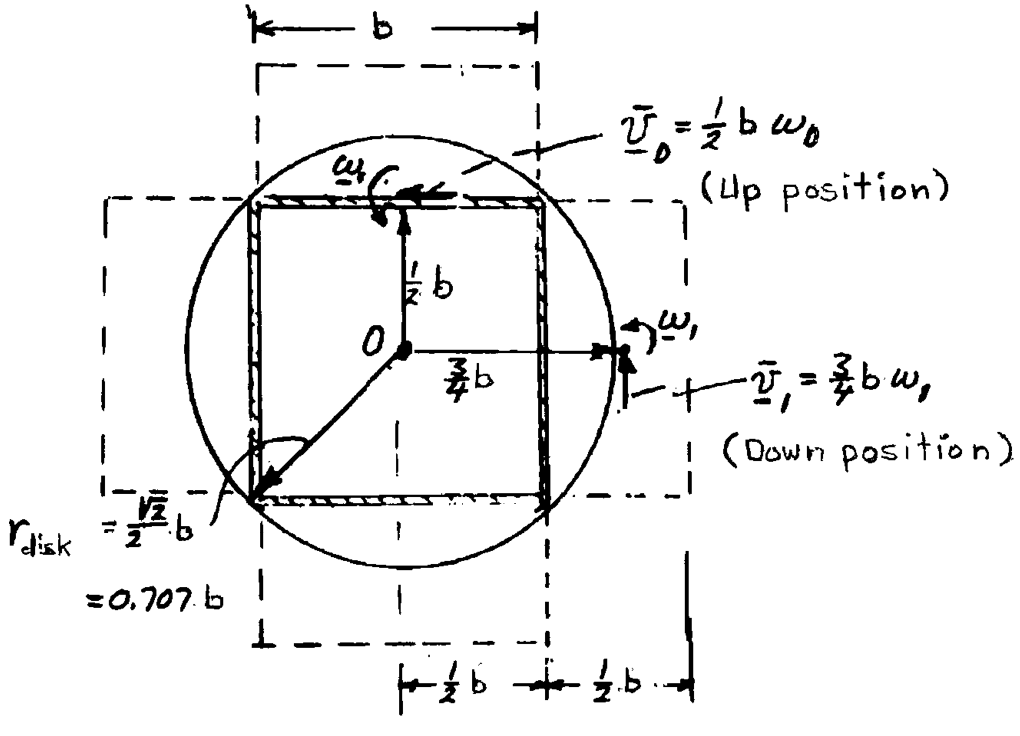
SOLUTION

Kinematics: When the panels are in the up position, the speed of the mass center of each panel is

$$v_0 = \frac{1}{2}b\omega_0$$

When the panels are in the down position the speed of the mass center of each panel is

$$v_1 = \frac{3}{4}b\omega_1$$



PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

Let $\rho =$ mass density of plate and of panels
$t =$ thickness of plate and of panels

Disk: $$m = \rho V = \rho \pi t(0.707b)^2 = \rho t \pi b^2 (0.500)$$

$$I_{\text{disk}} = I_D = \frac{1}{2} m (r_{\text{disk}})^2 = \frac{1}{2} \rho t \pi b^2 (0.500)(0.707b)^2$$

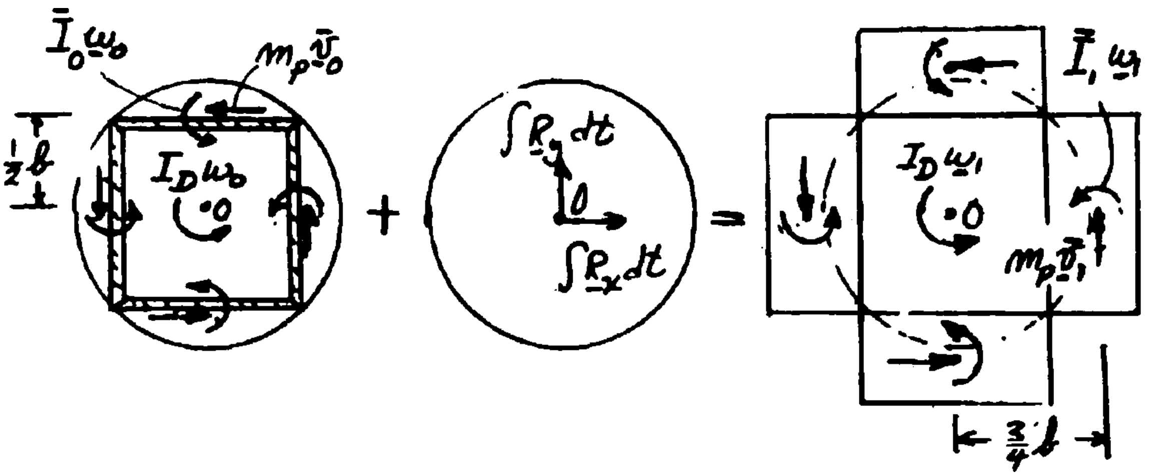
$$I_D = \frac{1}{8} \rho t \pi b^4$$

Each panel: $$m_\rho = b\left(\frac{1}{2}b\right)\rho t = \frac{1}{2}\rho t b^2$$

In up position $$\bar{I}_0 = \frac{1}{12} m_\rho b^2 = \frac{1}{12}\left(\frac{1}{2}\rho t b^2\right) b^2 = \frac{1}{24}\rho t b^4$$

In down position $$\bar{I}_1 = \frac{1}{12} m_\rho \left(b^2 + \left(\frac{1}{2}b\right)^2\right) = \frac{1}{12}\left(\frac{1}{2}\rho t b^2\right)\frac{5}{4} b^2 = \frac{5}{96}\rho t b^4$$

Principle of impulse and momentum.



Syst. Momenta$_0$ + **Syst. Ext. Imp.$_{0\to 1}$** = **Syst. Momenta$_1$**

In the up position, the angular momentum of one panel about the vertical axle is

$$m_\rho v_0 \left(\frac{1}{2}b\right) + \bar{I}_0 \omega_0$$

In the down position it is

$$m_\rho \bar{v}_1 \frac{3}{4} b + \bar{I}_1 \omega_1$$

Conservation of angular momentum.

PROBLEM 17.80

A 2.5-lb disk of radius 4 in. is attached to the yoke *BCD* by means of short shafts fitted in bearings at *B* and *D*. The 1.5-lb yoke has a radius of gyration of 3 in. about the *x* axis. Initially the assembly is rotating at 120 rpm with the disk in the plane of the yoke ($\theta = 0$). If the disk is slightly disturbed and rotates with respect to the yoke until $\theta = 90°$, where it is stopped by a small bar at *D*, determine the final angular velocity of the assembly.

SOLUTION

Moment of inertia of yoke: $$I_C = mk_C^2 = \left(\frac{1.5}{32.2}\right)\left(\frac{3}{12}\right)^2 = 2.9115\times10^{-3}\ \text{lb}\cdot\text{s}^2\cdot\text{ft}$$

Moment of inertia of disk:

$$\theta = 0:\quad I_A = \frac{1}{4}mr^2$$
$$= \frac{1}{4}\left(\frac{2.5}{32.2}\right)\left(\frac{4}{12}\right)^2$$
$$= 2.15666\times10^{-3}\ \text{lb}\cdot\text{s}^2\cdot\text{ft}$$

$$\theta = 90°:\quad I_A = \frac{1}{2}mr^2$$
$$= \frac{1}{2}\left(\frac{2.5}{32.2}\right)\left(\frac{4}{12}\right)^2$$
$$= 4.3133\times10^{-3}\ \text{lb}\cdot\text{s}^2\cdot\text{ft}$$

Total moment of inertia about the *x* axis:

$$\theta = 0:\quad (I_x)_1 = I_C + I_A$$
$$= 5.0682\times10^{-3}\ \text{lb}\cdot\text{s}^2\cdot\text{ft}$$
$$\theta = 90°:\quad (I_x)_2 = I_C + I_A$$
$$= 7.2248\times10^{-3}\ \text{lb}\cdot\text{s}^2\cdot\text{ft}$$

Angular momentum about the *x* axis:

$$\theta = 0:\quad H_1 = (I_x)_1\omega_1$$
$$= 5.0682\times10^{-3}\omega_1$$
$$\theta = 90°:\quad H_2 = (I_x)_2\omega_2$$
$$= 7.2248\times10^{-3}\omega_2$$

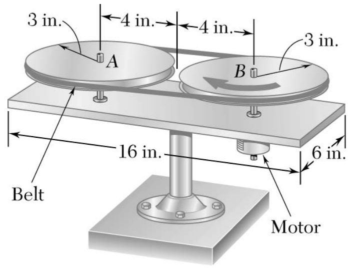
Conservation of angular momentum.

$$H_1 = H_2:\quad 5.0682\times10^{-3}\,\omega_1 = 7.2248\times10^{-3}\,\omega_2$$
$$\omega_2 = 0.7015\omega_1 = (0.7015)(120\ \text{rpm})$$

$\omega_2 = 84.2\ \text{rpm}$ ◀

If you are a student using this Manual, you are using it without permission.*

PROBLEM 17.81



Two 10-lb disks and a small motor are mounted on a 15-lb rectangular platform which is free to rotate about a central vertical spindle. The normal operating speed of the motor is 180 rpm. If the motor is started when the system is at rest, determine the angular velocity of all elements of the system after the motor has attained its normal operating speed. Neglect the mass of the motor and of the belt.

SOLUTION

Kinematics. Motor speed: $\omega_M = 180 \text{ rpm} = 6\pi \text{ rad/s}$

Let ω_A, ω_B, and ω_P be the angular velocities, respectfully, of disk *A*, disk *B* and the platform. Since the motor speed is the angular velocity of disk *B* relative to the platform,

$$\omega_B = \omega_P + \omega_M = \omega_P + 6\pi \tag{1}$$

Since, the disks have the same outer radius, $\omega_B = \omega_A$ (2)

Velocity of the center of disk *A* $v_A = \frac{4}{12}\omega_P$ (3)

Velocity of the center of disk *B* $v_B = \frac{4}{12}\omega_P$ (4)

Moments of inertia.

Disks *A* and *B*: $\bar{I}_A = \bar{I}_B = \frac{1}{2}\frac{W}{g}r^2 = \frac{1}{2}\left(\frac{10}{32.2}\right)\left(\frac{3}{12}\right)^2 = 9.705 \times 10^{-3} \text{ lb}\cdot\text{s}^2\cdot\text{ft}$

Platform: $\bar{I}_P = \frac{1}{12}\frac{W}{g}(a^2 + b^2) = \frac{1}{12}\left(\frac{15}{32.2}\right)\left[\left(\frac{16}{12}\right)^2 + \left(\frac{6}{12}\right)^2\right] = 78.718 \times 10^{-3} \text{ lb}\cdot\text{s}^2\cdot\text{ft}$

Principle of impulse and momentum for system.

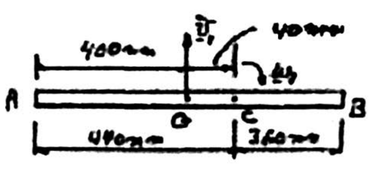
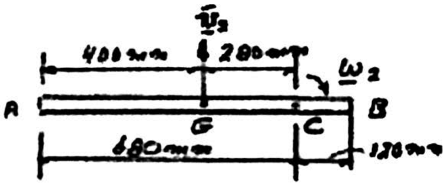
PROBLEM 17.82

A 3-kg rod of length 800 mm can slide freely in the 240-mm cylinder *DE*, which in turn can rotate freely in a horizontal plane. In the position shown the assembly is rotating with an angular velocity of magnitude $\omega = 40$ rad/s and end *B* of the rod is moving toward the cylinder at a speed of 75 mm/s relative to the cylinder. Knowing that the centroidal mass moment of inertia of the cylinder about a vertical axis is $0.025\ \text{kg}\cdot\text{m}^2$ and neglecting the effect of friction, determine the angular velocity of the assembly as end *B* of the rod strikes end *E* of the cylinder.

SOLUTION

Kinematics and geometry.





$\bar{v}_1 = (0.04\text{ m})\omega_1 = (0.4\text{ m})(40\text{ rad/s})$

$\bar{v}_1 = 1.6\text{ m/s}$

$\bar{v}_2 = (0.28\text{ m})\omega_2$

<u>Initial position</u> <u>Final position</u>

Conservation of angular momentum about *C*.

PROBLEM 17.84

In the helicopter shown, a vertical tail propeller is used to prevent rotation of the cab as the speed of the main blades is changed. Assuming that the tail propeller is not operating, determine the final angular velocity of the cab after the speed of the main blades has been changed from 180 to 240 rpm. (The speed of the main blades is measured relative to the cab, and the cab has a centroidal moment of inertia of $650 \text{ lb}\cdot\text{ft}\cdot\text{s}^2$. Each of the four main blades is assumed to be a slender 14-ft rod weighting 55 lb.)

SOLUTION

Let $\mathbf{\Omega}$ be the angular velocity of the cab and ω be the angular velocity of the blades relative to the cab. The absolute angular velocity of the blades is $\Omega + \omega$.

$$\omega_1 = 180 \text{ rpm} = 6\pi \text{ rad/s}$$
$$\omega_2 = 240 \text{ rpm} = 8\pi \text{ rad/s}$$

Moments of inertia.

Cab: $I_C = 650 \text{ lb}\cdot\text{ft}\cdot\text{s}^2$

Blades:
$$I_B = 4\left(\frac{1}{3}mL^2\right)$$
$$= (4)\left(\frac{1}{3}\right)\left(\frac{55}{32.2}\right)(14)^2$$
$$= 446.38 \text{ lb}\cdot\text{ft}\cdot\text{s}^2$$

Assume $\Omega_1 = 0.$

Conservation of angular momentum about shaft.

$$I_B(\omega_1 + \Omega_1) + I_C\Omega_1 = I_B(\omega_2 + \Omega_2) + I_C\Omega_2$$
$$\Omega_2 = -\frac{I_B(\omega_2 - \omega_1)}{I_C + I_B}$$
$$= -\frac{(446.38)(8\pi - 6\pi)}{446.38 + 650}$$
$$= -2.5581 \text{ rad/s}$$

$\Omega_2 = -24.4 \text{ rpm}$ ◀

PROBLEM 17.85

Assuming that the tail propeller in Problem 17.84 is operating and that the angular velocity of the cab remains zero, determine the final horizontal velocity of the cab when the speed of the main blades is changed from 180 to 240 rpm. The cab weighs 1250 lb and is initially at rest. Also determine the force exerted by the tail propeller if the change in speed takes place uniformly in 12 s.

SOLUTION

Let $\mathbf{\Omega}$ be the angular velocity of the cab and ω be the angular velocity of the blades relative to the cab. The absolute angular velocity of the blades is $\Omega + \omega$.

$$\omega_1 = 180 \text{ rpm} = 6\pi \text{ rad/s}$$

$$\omega_2 = 240 \text{ rpm} = 8\pi \text{ rad/s}$$

Moments of inertia.

Cab: $I_C = 650 \text{ lb}\cdot\text{ft}\cdot\text{s}^2$

Blades: $I_B = 4\left(\frac{1}{3}mL^2\right) = (4)\left(\frac{1}{3}\right)\left(\frac{55}{32.2}\right)(14)^2$

$$= 446.38 \text{ lb}\cdot\text{ft}\cdot\text{s}^2$$

The cab does not rotate. $\Omega_1 = \Omega_2 = 0$

$$\textbf{Syst. Momenta}_1 + \textbf{Syst. Ext. Imp.}_{1\to 2} = \textbf{Syst. Momenta}_2$$

Moments about shaft: $I_B(\omega_1 + \Omega_1) + I_C\Omega_1 + Frt = I_B(\omega_2 + \Omega_2) + I_C\Omega_2$

$$Frt = I_B(\omega_2 - \omega_1)$$

$$= (446.38)(8\pi - 6\pi)$$

$$= 2804.7 \text{ lb}\cdot\text{ft}\cdot\text{s}$$

$$Ft = \frac{Frt}{r} = \frac{2804.7}{16} = 175.29 \text{ lb}\cdot\text{s}$$

Linear components: $mv_1 + Ft = mv_2$

$$v_2 - v_1 = \frac{Ft}{m} = \frac{175.29}{\frac{1250}{32.2} + (4)\left(\frac{55}{32.2}\right)}$$

$$= 3.8398 \text{ ft/s}$$

(*a*) Assume $v_1 = 0$. $v_2 = 3.84 \text{ ft/s}$ ◀

(*b*) Force. $F = \frac{Ft}{t} = \frac{175.29}{12}$ $F = 14.61 \text{ lb}$ ◀

PROBLEM 17.86

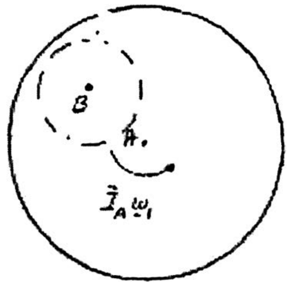
The circular platform A is fitted with a rim of 200-mm inner radius and can rotate freely about the vertical shaft. It is known that the platform-rim unit has a mass of 5 kg and a radius of gyration of 175 mm with respect to the shaft. At a time when the platform is rotating with an angular velocity of 50 rpm, a 3-kg disk B of radius 80 mm is placed on the platform with no velocity. Knowing that disk B then slides until it comes to rest relative to the platform against the rim, determine the final angular velocity of the platform.

SOLUTION

Moments of inertia.

$$\bar{I}_A = m_A k^2 = (5\text{ kg})(0.175\text{ m})^2 = 0.153125\text{ kg}\cdot\text{m}^2$$

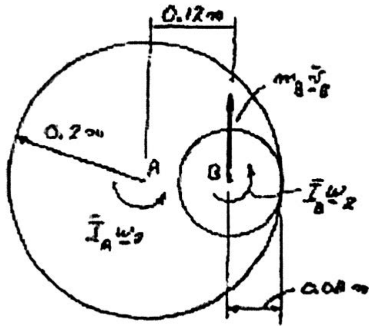
$$\bar{I}_B = \frac{1}{2}m_B r_B^2 = \frac{1}{2}(3\text{ kg})(0.08\text{ m})^2 = 9.6\times 10^{-3}\text{ kg}\cdot\text{m}^2$$



Syst. Momenta$_1$

<u>State 1</u> Disk B is at rest.

<u>State 2</u> Disk B moves with platform A.



Syst. Momenta$_2$

Kinematics. In <u>State 2</u>, $\bar{v}_B = (0.12\text{ m})\omega_2$

Principle of conservation of angular momentum.

$+\circlearrowleft$ Moments about D: $\bar{I}_A\omega_1 = \bar{I}_A\omega_2 + \bar{I}_B\omega_2 + m_B\bar{v}_B(0.12\text{ m})$

$$(0.153125\text{ kg}\cdot\text{m}^2)\omega_1 = (0.153125\text{ kg}\cdot\text{m}^2)\omega_2 + (9.6\times 10^{-3}\text{ kg}\cdot\text{m}^2)\omega_2 + (3\text{ kg})(0.12\text{ m})^2\omega_2$$

$$0.153125\omega_2 = 0.20593\omega_1$$

$$\omega_2 = 0.7436\omega_1 = 0.7436(50\text{ rpm})$$

Final angular velocity $\omega_2 = 37.2\text{ rpm}$ ◀

PROBLEM 17.89

A 1.8-kg collar A and a 0.7-kg collar B can slide without friction on a frame, consisting of the horizontal rod OE and the vertical rod CD, which is free to rotate about its vertical axis of symmetry. The two collars are connected by a cord running over a pulley that is attached to the frame at O. At the instant shown, the velocity $\mathbf{v}_A$ of collar A has a magnitude of 2.1 m/s and a stop prevents collar B from moving. The stop is suddenly removed and collar A moves toward E. As it reaches a distance of 0.12 m from O, the magnitude of its velocity is observed to be 2.5 m/s. Determine at that instant the magnitude of the angular velocity of the frame and the moment of inertia of the frame and pulley system about CD.

SOLUTION

Components of velocity of collar A. $\quad v_A^2 = (v_A)_r^2 + (v_A)_\theta^2 \qquad (1)$

Constraint of rod OE. $\quad (v_A)_\theta = r_A\omega \qquad (2)$

Constraint of cable AB. $\quad \Delta r_A = \Delta y_B, \quad (v_A)_r = v_B \qquad (3)$

Position 1. $\quad (\Delta r_A) = 0.1\text{ m}, \quad [(v_A)_r]_1 = 0, \quad (v_A)_1 = 2.1\text{ m/s}$

From Equation (1), $\quad (2.1)^2 = 0 + [(v_A)_\theta]_1^2 \qquad [(v_A)_\theta]_1 = 2.1\text{ m/s}$

From Equation (2), $\quad (2.1) = 0.1\omega_1 \qquad \omega_1 = 21\text{ rad/s}$

From Equation (3), $\quad v_B = 0$

Potential energy. Take position 1 as datum. $\quad V_1 = 0 \qquad (4)$

Angular momentum. $\quad (H_O)_1 = I\omega_1 + m_A[(v_A)_r]_1(r_A)_1:$

$$(H_O)_1 = I(21) + (1.8)(2.1)(0.1) \qquad (H_O)_1 = 21I + 0.378 \qquad (5)$$

Kinetic energy. $\quad T_1 = \frac{1}{2}I\omega_1^2 + \frac{1}{2}m_Av_A^2 + \frac{1}{2}m_Bv_B^2:$

$$T_1 = \frac{1}{2}I(21)^2 + \frac{1}{2}(1.8)(2.1)^2 \qquad T_1 = 220.5I + 3.969 \qquad (6)$$

Position 2. $\quad (r_A)_2 = 0.12\text{ m}, \quad (v_A)_2 = 2.5\text{ m/s} \qquad \omega = \omega_2$

From Equation (2), $\quad [(v_A)_\theta]_2 = 0.12\omega_2$

From Equation (1), $\quad [(v_A)_r]_2^2 = (v_A)_2^2 - [(v_A)_\theta]_2^2 = (2.5)^2 - (0.12)^2\omega_2^2$

$$= 6.25 - 0.0144\omega_2^2$$

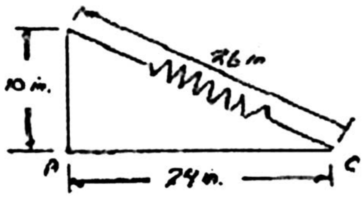
PROBLEM 17.90

A 6-lb collar C is attached to a spring and can slide on rod AB, which in turn can rotate in a horizontal plane. The mass moment of inertia of rod AB with respect to end A is 0.35 lb · ft · s^2. The spring has a constant $k = 15$ lb/in. and an undeformed length of 10 in. At the instant shown the velocity of the collar relative to the rod is zero, and the assembly is rotating with an angular velocity of 12 rad/s. Neglecting the effect of friction, determine (a) the angular velocity of the assembly as the collar passes through a point located 7.5 in. from end A of the rod, (b) the corresponding velocity of the collar relative to the rod.

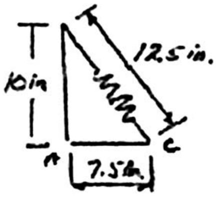
SOLUTION

Potential energy of spring: undeformed length = 10 in.

Position 1:



Position 2:



Position 1:

$$\Delta = 26\text{ in.} - 10\text{ in.} = 16\text{ in.}$$

$$V_1 = \frac{1}{2}k\Delta^2 = \frac{1}{2}(15\text{ lb/in.})(16\text{ in.})^2$$

$$= 1920\text{ in.}\cdot\text{lb}$$

$$V_1 = 160\text{ ft}\cdot\text{lb}$$

Position 2:

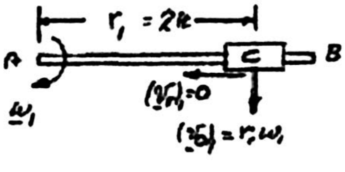
$$\Delta = 12.5\text{ in.} - 10\text{ in.} = 2.5\text{ in.}$$

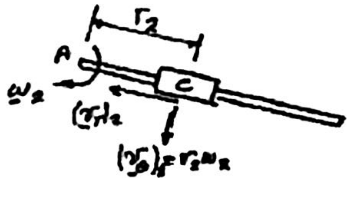
$$V_2 = \frac{1}{2}k\Delta^2 = \frac{1}{2}(15\text{ lb/in.})(2.5\text{ in.})^2$$

$$= 46.875\text{ in.}\cdot\text{lb}$$

$$V_2 = 3.91\text{ ft}\cdot\text{lb}$$

Kinematics:





Kinetics: Since moments of all forces about shaft at A are zero, $(\mathbf{H}_A)_1 = (\mathbf{H}_A)_2$

$$I_R\omega_1 + m_C(v_0)r_1 = I_R\omega_C + m_C(v_0)_2 r_2$$

$$\left(I_R + m_C r_1^2\right)\omega_1 = \left(I_R + m_C r_2^3\right)\omega_2$$

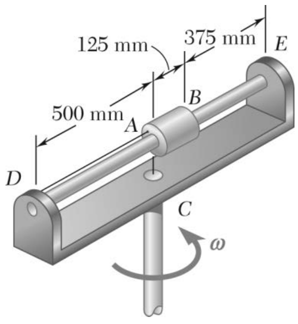
PROBLEM 17.94



In Problem 17.83 determine the velocity of the tube relative to the rod as the tube strikes end E of the assembly.

PROBLEM 17.83 A 1.6-kg tube AB can slide freely on rod DE which in turn can rotate freely in a horizontal plane. Initially the assembly is rotating with an angular velocity $\omega = 5$ rad/s and the tube is held in position by a cord. The moment of inertia of the rod and bracket about the vertical axis of rotation is $0.30\ \text{kg}\cdot\text{m}^2$ and the centroidal moment of inertia of the tube about a vertical axis is $0.0025\ \text{kg}\cdot\text{m}^2$. If the cord suddenly breaks, determine (*a*) the angular velocity of the assembly after the tube has moved to end E, (*b*) the energy lost during the plastic impact at E.

SOLUTION

Let Point C be the intersection of axle C and rod DE. Let Point G be the mass center of tube AB.

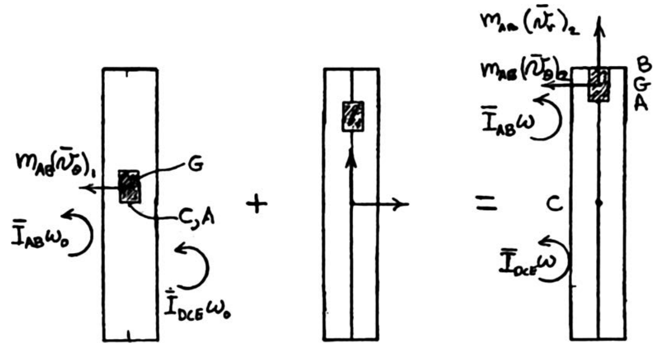
Masses and moments of inertia about vertical axes.

$$m_{AB} = 1.6\ \text{kg}, \qquad \bar{I}_{AB} = 0.0025\ \text{kg}\cdot\text{m}^2, \qquad \bar{I}_{DCE} = 0.30\ \text{kg}\cdot\text{m}^2$$

State 1. $\quad (r_{G/A})_1 = \frac{1}{2}(125) = 62.5\ \text{mm}, \qquad \omega_1 = 5\ \text{rad/s}, \quad (v_r)_1 = 0$

State 2. $\quad (r_{G/A})_2 = 500 - 62.5 = 437.5\ \text{mm}, \qquad \omega = \omega_2, \qquad v_r = (v_r)_2 = 0$

Kinematics. $\quad (v_G)_\theta = \bar{v}_\theta = r_{G/C}\,\omega$



Syst. Momenta$_1$ + **Syst. Ext. Imp.**$_{1\to2}$ = **Syst. Momenta**$_2$

Moments about C:

$$\bar{I}_{AB}\omega_1 + \bar{I}_{DCE}\omega_1 + m_{AB}(\bar{v}_\theta)_1(r_{G/C})_1 + 0 = \bar{I}_{AB}\omega_2 + \bar{I}_{DCE}\omega_2 + m_{AB}(\bar{v}_\theta)_2(r_{G/C})_2$$

$$\left[\bar{I}_{AB} + \bar{I}_{DCE} + m_{AB}(r_{G/C})_1^2\right]\omega_1 = \left[\bar{I}_{AB} + \bar{I}_{DCE} + m_{AB}(r_{G/C})_2^2\right]\omega_2$$

$$[0.0025 + 0.30 + (1.6)(0.0625)^2](5) = [0.0025 + 0.30 + (1.6)(0.4375)^2]\omega_2$$

$$(0.30875)(5) = 0.60875\omega_2 \qquad \omega_2 = 2.5359\ \text{rad/s}$$

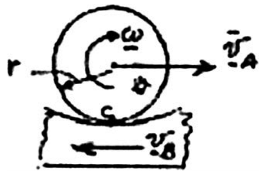
PROBLEM 17.95

The 6-lb steel cylinder *A* and the 10-lb wooden cart *B* are at rest in the position shown when the cylinder is given a slight nudge, causing it to roll without sliding along the top surface of the cart. Neglecting friction between the cart and the ground, determine the velocity of the cart as the cylinder passes through the lowest point of the surface at *C*.

SOLUTION

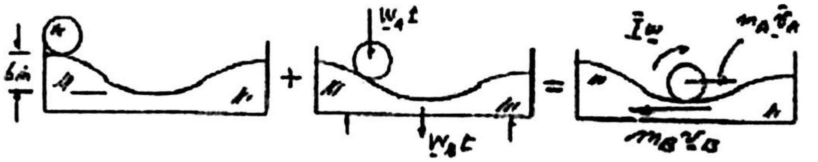
Kinematics (when cylinder is passing *C*)



$$\overset{+}{\longleftarrow} \quad v_B = v_C = r\omega - \bar{v}_A$$

$$\omega = \frac{\bar{v}_A + v_B}{r}$$

Principle of impulse and momentum.



Syst. of Momenta$_1$ + **Syst. Ext. Imp.**$_{1\to2}$ = **Syst. Momenta**$_2$

$\overset{+}{\longrightarrow}$ *x* components: $\quad m_A\bar{v}_A - m_B v_B = 0$

$$\frac{6\text{ lb}}{g}\bar{v}_A = \frac{10\text{ lb}}{g}v_B; \quad v_B = 0.6\,\bar{v}_A$$

Work: $\quad U_{1\to2} = W_A(6\text{ in.}) = (6\text{ lb})\left(\frac{6}{12}\text{ ft}\right) = 3\text{ ft}\cdot\text{lb}; \quad T_1 = 0$

Kinetic energy: $\quad T_2 = \frac{1}{2}m_A\bar{v}_A^2 + \frac{1}{2}\bar{I}\omega^2 + \frac{1}{2}m_B v_3^2$

$$v_B = 0.6\bar{v}_A; \quad \omega = \frac{\bar{v}_A + v_0}{r} = \frac{v_A + 0.6v_A}{r} = \frac{1.6v_A}{r}$$

$$T_2 = \frac{1}{2}\left(\frac{6\text{ lb}}{g}\right)\bar{v}_A^2 + \frac{1}{2}\left[\frac{1}{2}\frac{6\text{ lb}}{g}r^2\right]\left(\frac{1.6v_A}{r}\right)^2 + \frac{1}{2}\frac{10\text{ lb}}{g}(0.6v_A)^2$$

$$= \frac{3}{g}\bar{v}_A^2 + \frac{3.84}{g}\bar{v}_A^2 + \frac{1.8}{g}\bar{v}_A^2 = \frac{8.64}{g}\bar{v}_A^2$$

Principle of work and energy: $\quad T_1 + U_{1\to2} = T_2$

$$0 + 3\text{ ft}\cdot\text{lb} = \frac{8.64}{32.2}v_A^2$$

$$\bar{v}_A^2 = 11.181 \quad \bar{\mathbf{v}}_A = 3.344\text{ ft/s} \longrightarrow$$

$$v_B = 0.6\bar{v}_A = 0.6(3.344) \qquad \mathbf{v}_B = 2.01\text{ ft/s} \longleftarrow \blacktriangleleft$$

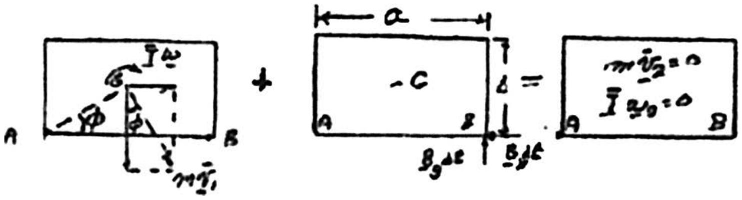
PROBLEM 17.107

A uniformly loaded rectangular crate is released from rest in the position shown. Assuming that the floor is sufficiently rough to prevent slipping and that the impact at B is perfectly plastic, determine the smallest value of the ratio a/b for which corner A will remain in contact with the floor.

SOLUTION

We consider the limiting case when the crate is just ready to rotate about B. At that instant the velocities must be zero and the reaction at corner A must be zero. Use the principle of impulse and momentum.



$$\textbf{Syst. Momenta}_1 + \textbf{Syst. Ext. Imp.}_{1\to 2} = \textbf{Syst. Momenta}_2$$

$+\circlearrowright$ Moments about B:

$$\bar{I}\omega_1 + (m\bar{v}_1)_2\frac{b}{2} - (m\bar{v}_1)_y\frac{a}{2} + 0 = 0 \qquad (1)$$

Note:

$$\sin\phi = \frac{b}{\sqrt{a^2+b^2}}, \quad \cos\phi = \frac{a}{\sqrt{a^2+b^2}}$$

$$\bar{v}_1 = (AG)v_1 = \frac{1}{2}\sqrt{a^2+b^2}\,\omega_1$$

Thus:

$$(m\bar{v}_1)_x = (m\bar{v}_1)\sin\phi = \frac{m}{2}\sqrt{a^2+b^2}\,\omega_1\frac{b}{\sqrt{a^2+b^2}} = \frac{1}{2}mb\omega_1$$

Also,

$$(m\bar{v}_1)_y = (m\bar{v}_1)\cos\phi = \frac{1}{2}ma\omega$$

$$\bar{I} = \frac{1}{12}m(a^2+b^2)$$

From Eq. (1)

$$\frac{1}{12}m(a^2+b^2)\omega_1 + \frac{1}{2}(mb\omega_1)\frac{b}{2} - \frac{1}{2}(ma\omega_1)\frac{a}{2} = 0$$

$$\frac{1}{3}mb^2\omega_1 - \frac{1}{6}ma^2v_1 = 0 \qquad \frac{a^2}{b^2} = 2 \quad \frac{a}{b} = \sqrt{2} \quad \frac{a}{b} = 1.414 \blacktriangleleft$$

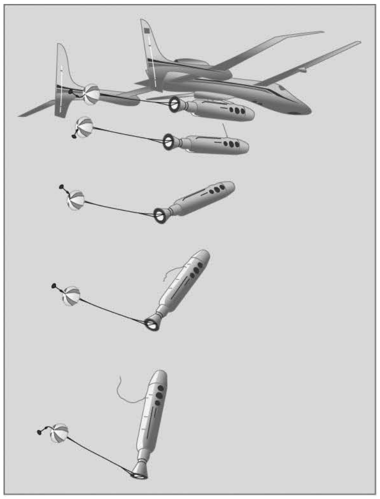
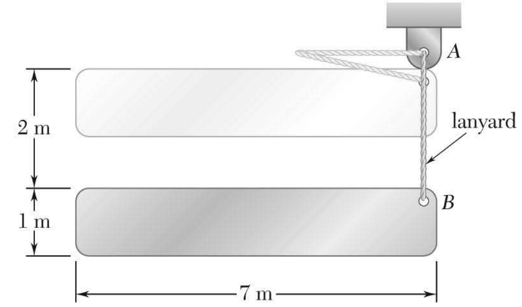
PROBLEM 17.114

The trapeze/lanyard air drop (t/LAD) launch is a proposed innovative method for airborne launch of a payload-carrying rocket. The release sequence involves several steps as shown in (1) where the payload rocket is shown at various instances during the launch. To investigate the first step of this process where the rocket body drops freely from the carrier aircraft until the 2-m lanyard stops the vertical motion of *B*, a trial rocket is tested as shown in (2). The rocket can be considered a uniform 1-m by 7-m rectangle with a mass of 4000 kg. Knowing that the rocket is released from rest and falls vertically 2 m before the lanyard becomes taut, determine the angular velocity of the rocket immediately after the lanyard is taut.



(1)



(2)

SOLUTION

While the lanyard is slack, the rocket falls freely without rotation. Considering its motion relative to the airplane (a Newtonian frame of reference), its vertical velocity is

$$v_1^2 = v_0^2 + 2gy = 2gy$$

$$v_1 = \sqrt{2gy} = \sqrt{(2)(9.81 \text{ m/s})(2 \text{ m})} \qquad \mathbf{v}_1 = 6.2642 \text{ m/s}\downarrow \qquad (1)$$

Moment of inertia:

$$\bar{I} = \frac{1}{12}m(a^2 + b^2)$$

$$= \frac{1}{12}(4000 \text{ kg})[(7 \text{ m})^2 + (1 \text{ m})^2] = 16.667 \text{ kg}\cdot\text{m}^2$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 17.115

The uniform rectangular block shown is moving along a frictionless surface with a velocity $\overline{\mathbf{v}}_1$ when it strikes a small obstruction at B. Assuming that the impact between corner A and obstruction B is perfectly plastic, determine the magnitude of the velocity $\overline{\mathbf{v}}_1$ for which the maximum angle θ through which the block will rotate is 30°.

SOLUTION

Let m be the mass of the block.

Dimensions: $a = 0.200$ m

$b = 0.100$ m

Moment of inertia about the mass center.

$$\bar{I} = \frac{1}{12}m(a^2 + b^2)$$

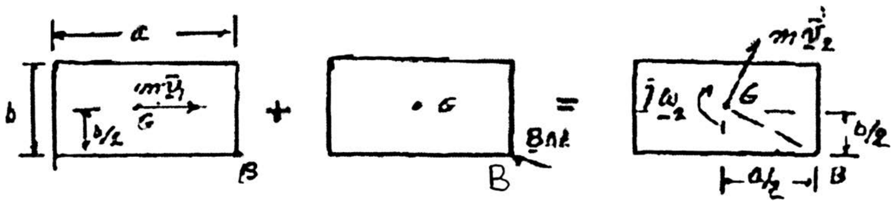
Let d be one half the diagonal. $d = \frac{1}{2}\sqrt{a^2 + b^2} = 0.1118$ m

Kinematics. Before impact $\overline{\mathbf{v}}_1 = v_1 \longrightarrow, \quad \boldsymbol{\omega}_1 = 0$

After impact, the block is rotating about corner at B.

$$\boldsymbol{\omega}_2 = \omega_2 \circlearrowright \quad \mathbf{v}_2 = d\omega_2 \nearrow$$

Principle of impulse and momentum.



Syst. Momenta$_1$ + **Syst. Ext. Imp.**$_{1\to 2}$ = **Syst. Momenta**$_2$

$\circlearrowleft$+ Moments about B:

$$\frac{mv_1 b}{2} + 0 = \bar{I}\omega_2 + mdv_2$$

$$\frac{1}{2}mv_1 b = \frac{1}{12}m(a^2 + b^2)\omega_2 + md^2\omega_2$$

$$= \frac{1}{3}m(a^2 + b^2)\omega_2$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. Conservation of energy during rising. $T_3 + V_3 = T_2 + V_2$ (2)

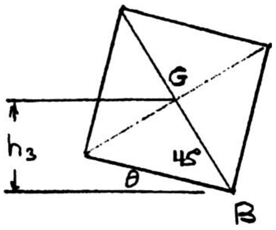
Conditions:
$$T_0 = 0, \quad T_3 = 0 \quad T_2 = \frac{1}{16}T_1$$
$$V_0 = mg\left(\frac{1}{2}\sqrt{2}c\right) \quad V_1 = V_2 = mg\left(\frac{1}{2}c\right) \quad V_3 = mgh_3$$

From Equation (1),
$$T_1 = V_0 - V_1 = \frac{1}{2}(\sqrt{2} - 1)mgc$$

From Equation (2),
$$T_2 = V_3 - V_2 = mgh_3 - \frac{1}{2}mgc$$
$$\frac{h_3 - \frac{1}{2}c}{\frac{1}{2}\sqrt{2} - 1} = \frac{1}{16} \qquad h_3 = \left[\frac{1}{2} + \frac{1}{16}(\sqrt{2} - 1)\right]c$$

(*c*) From geometry,
$$h_3 = \frac{1}{2}\sqrt{2}c\sin(\theta + 45°)$$



Equating the two expressions for h_3,
$$\sin(45° + \theta) = \frac{\frac{1}{2} + \frac{1}{16}(\sqrt{2} - 1)}{\frac{1}{2}\sqrt{2}}$$
$$45° + \theta = 46.503°$$
$\theta = 1.50°$ ◀

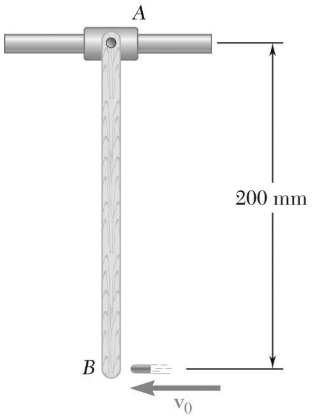
PROBLEM 17.119



A 1-oz bullet is fired with a horizontal velocity of 750 mi/h into the 18-lb wooden beam *AB*. The beam is suspended from a collar of negligible mass that can slide along a horizontal rod. Neglecting friction between the collar and the rod, determine the maximum angle of rotation of the beam during its subsequent motion.

SOLUTION

Mass of bullet. $W' = 1 \text{ ounce} = 0.0625 \text{ lb}$

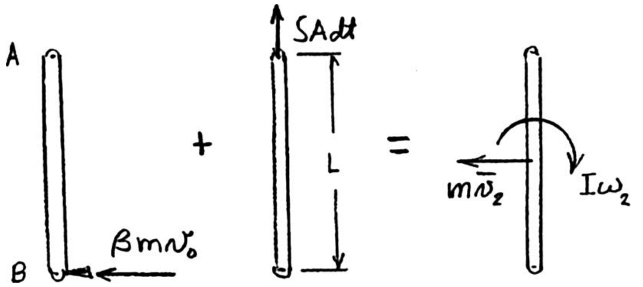
Mass of beam *AB*. $W = 18 \text{ lb}$

Mass ratio. $\beta = \dfrac{W'}{W} = 0.0034722 \quad W' = \beta W \text{ and } m' = \beta m$

Since β is so small, the mass of the bullet will be neglected in comparison with that of the beam in determining the motion after the impact.

Moment of inertia. $\bar{I} = \dfrac{1}{12} mL^2$

Impact kinetics.



Syst. Momenta$_1$ + Syst. Ext. Imp.$_{1\to 2}$ = Syst. Momenta$_2$

$\overset{+}{\leftarrow}$ linear components: $-\beta m v_0 + 0 = m\bar{v}_2 \qquad \bar{v}_2 = \beta v_0$

$\circlearrowright$ Moments about *B*: $0 + 0 = \bar{I}\,\omega - m\bar{v}_2 \dfrac{L}{2}$

$$\omega = \frac{m\bar{v}_2 L}{2\bar{I}} = \frac{12 m\beta v_0 L}{2mL^2}$$

$$\omega = \frac{6\beta v_0}{L}$$

PROBLEM 17.123

A small plate B is attached to a cord that is wrapped around a uniform 8-lb disk of radius $R = 9$ in. A 3-lb collar A is released from rest and falls through a distance $h = 15$ in. before hitting plate B. Assuming that the impact is perfectly plastic and neglecting the weight of the plate, determine immediately after the impact (*a*) the velocity of the collar, (*b*) the angular velocity of the disk.

SOLUTION

The collar A falls a distance h. From the principle of conservation of energy.

$$v_1 = \sqrt{2gh}$$

Impact analysis: $e = 0$

Kinematics. Collar A and plate B move together. The cord is inextensible.

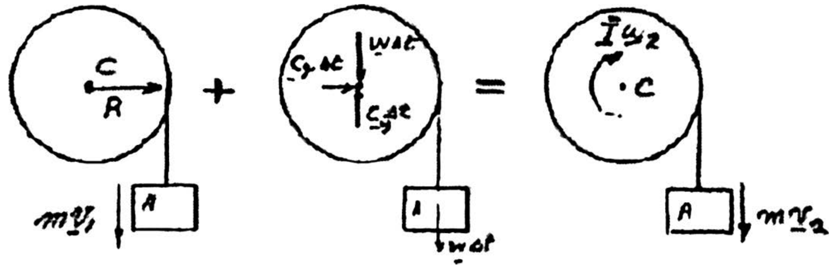
$$\bar{v}_2 = R\omega \quad \text{or} \quad \omega_2 = \frac{\bar{v}_2}{R}$$

Let m = mass of collar A and M = mass of disk.

Moment of inertia of disk: $\bar{I} = \dfrac{1}{2}MR^2$

Principle of impulse and momentum.

$\bar{I}\omega_1 = 0$



Syst. Momenta$_1$ + **Syst. Ext. Imp.**$_{1\to 2}$ = **Syst. Momenta**$_2$

$+\circlearrowright$ Moments about C: $\quad m v_1 R = \bar{I}\omega_2 + m v_2 R \qquad (1)$

$$m v_1 R = \frac{1}{2}MR^2\left(\frac{v_2}{R}\right) + m v_2 R$$

$$m v_1 = \frac{1}{2}Mv_2 + m v_2$$

$$v_2 = \frac{2m}{2m + M}v_1$$

PROBLEM 17.124

Solve Problem 17.123, assuming that the coefficient of restitution between A and B is 0.8.

PROBLEM 17.123 A small plate B is attached to a cord that is wrapped around a uniform 8-lb disk of radius $R = 9$ in. A 3-lb collar A is released from rest and falls through a distance $h = 15$ in. before hitting plate B. Assuming that the impact is perfectly plastic and neglecting the weight of the plate, determine immediately after the impact (a) the velocity of the collar, (b) the angular velocity of the disk.

SOLUTION

$$W_D = 8 \text{ lb}$$

$$m_D = \frac{W_D}{g} = \frac{8}{32.2} = 0.2484 \text{ lb}\cdot\text{s}^2/\text{ft}$$

$$R = 9 \text{ in.} = 0.75 \text{ ft}$$

$$I_D = \frac{1}{2} m_D R^2 = 0.06988 \text{ lb}\cdot\text{s}^2\cdot\text{ft}$$

$$W_A = 3 \text{ lb}$$

$$m_A = \frac{W_A}{g} = \frac{3}{32.2} = 0.09317 \text{ lb}\cdot\text{s}^2/\text{ft}$$

$$h = 15 \text{ in.} = 1.25 \text{ ft}$$

Collar A falls through distance h. Use conservation of energy.

$$T_1 = 0$$

$$V_1 = W_A h$$

$$T_2 = \frac{1}{2} m_A v_A^2$$

$$V_2 = 0$$

$$T_1 + V_1 = T_2 + V_2: \quad 0 + W_A h = \frac{1}{2} m_A v_A^2 + 0$$

$$v_A^2 = \frac{2 m_A h}{W_A} = 2gh$$

$$= (2)(32.2)(1.25)$$

$$= 80.5 \text{ ft}^2/\text{s}^2$$

$$\mathbf{v}_A = 8.972 \text{ ft/s}\downarrow$$

Impact. Neglect the mass of plate B. Neglect the effect of weight over the duration of the impact.

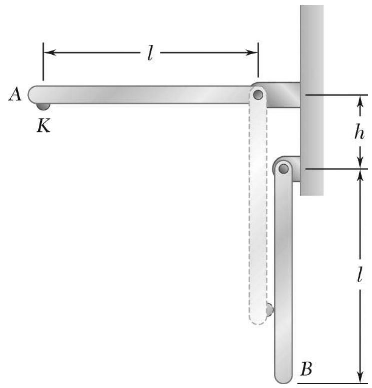
PROBLEM 17.125



Two identical slender rods may swing freely from the pivots shown. Rod A is released from rest in a horizontal position and swings to a vertical position, at which time the small knob K strikes rod B which was at rest. If $h=\frac{1}{2}l$ and $e=\frac{1}{2}$, determine (a) the angle through which rod B will swing, (b) the angle through which rod A will rebound.

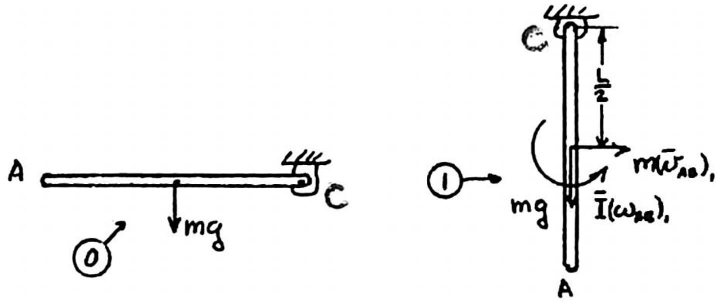
SOLUTION

Let $$m = m_{AC} = m_{BD}$$

Moment of inertia. $$\bar{I}_{AC} = \bar{I} = \frac{1}{12}mL^2$$

$$\bar{I}_{BD} = \frac{1}{12}mL^2$$

Rod AB falls to vertical position.



Position 0. $$V_1 = 0 \qquad T_1 = 0$$

Position 1. $$V_2 = -mg\frac{L}{2}$$

$$(\bar{v}_{AC})_1 = \frac{L}{2}(\omega_{AC})_1$$

$$T_1 = \frac{1}{2}m(\bar{v}_{AC})_1^2 + \frac{1}{2}I(\omega_{AC})_1^2$$

$$= \frac{1}{6}mL^2(\omega_{AC})_1^2$$

Conservation of energy. $$T_0 + V_0 = T_1 + V_1: \quad 0 + 0 = \frac{1}{6}mL^2(\omega_{AC})_1^2 - \frac{1}{2}mgL$$

$$(\omega_{AC})_1^2 = \frac{3g}{L} \qquad (1)$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 17.125 (Continued)

Condition of impact: $L(\omega_{AC})_2 - (L-h)(\omega_{BD})_2 = -eL(\omega_{AC})_1$ (2)

For $h = \frac{1}{2}L$ and $e = 0.5$ Eqs. (1) and (2) become

$$\frac{1}{6}mL^3(\omega_{AC})_1 = \frac{1}{6}mL^3(\omega_{AC})_2 + \frac{1}{3}mL^3(\omega_{BD})_2 \quad (3)$$

$$-\frac{1}{2} = 0.5L(\omega_{AB})_1 \quad (4)$$

Dividing Eq. (3) by $\frac{1}{6}mL^3$ and transposing terms gives

$$(\omega_{AC})_2 + 2(\omega_{BD})_2 = (\omega_{AC})_1 \quad (5)$$

Dividing Eq. (4) by $L/2$ and transposing terms gives

$$2(\omega_{AC})_2 - (\omega_{BD})_2 = -(\omega_{AC})_1 \quad (6)$$

Solving Eqs. (5) and (6) simultaneously for $(\omega_{AC})_2$ and $(\omega_{BD})_2$ gives

$$(\omega_{AC})_2 = -0.2(\omega_{AC})_1 \quad (7)$$

$$(\omega_{BD})_2 = 0.6(\omega_{AC})_1 \quad (8)$$

(*a*) *Angle of swing* θ_B *for rod B.*

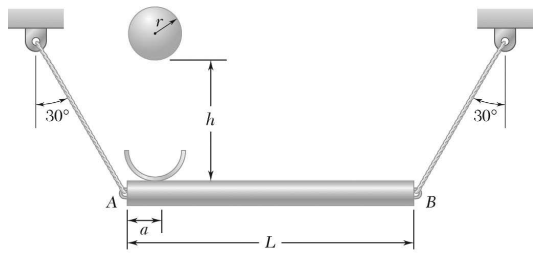
PROBLEM 17.126



A 2-kg solid sphere of radius $r = 40$ mm is dropped from a height $h = 200$ mm and lands on a uniform slender plank AB of mass 4 kg and length $L = 500$ mm which is held by two inextensible cords. Knowing that the impact is perfectly plastic and that the sphere remains attached to the plank at a distance $a = 40$ mm from the left end, determine the velocity of the sphere immediately after impact. Neglect the thickness of the plank.

SOLUTION

Masses and moments of inertia.

Sphere: $m_S = 2\text{ kg},\quad r = 40\text{ mm} = 0.040\text{ m}$

$$\bar{I}_S = \frac{2}{5}m_S r^2 = \left(\frac{2}{5}\right)(2\text{ kg})(0.04\text{ m})^2 = 1.28\times10^{-3}\text{ kg}\cdot\text{m}^2$$

Plank AB: $m_{AB} = 4\text{ kg},\quad L = 500\text{ mm} = 0.5\text{ m}$

$$\bar{I}_{AB} = \frac{1}{12}m_{AB}L^2 = \left(\frac{1}{12}\right)(4\text{ kg})(0.5\text{ m})^2 = 83.333\times10^{-3}\text{ kg}\cdot\text{m}^2$$

Velocity of sphere at impact.

$$v_S = \sqrt{2gh} = \sqrt{(2)(9.81\text{ m/s})(0.200\text{ m})} = 1.9809\text{ m/s}$$

Before impact.

Linear momentum: $m_S\mathbf{v}_S = (4\text{ kg})(1.9809\text{ m/s})\downarrow = 7.9236\text{ kg}\cdot\text{m/s}\downarrow$

with its line of action lying at distance $\frac{L}{2} - a$ from the midpoint of the plank.

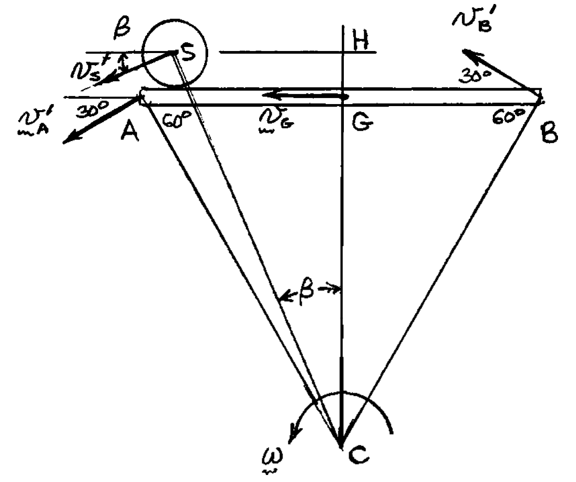
$$\frac{L}{2} - a = 0.25\text{ m} - 0.04\text{ m} = 0.21\text{ m}.$$

After impact. Assume that both cables are taut so $\mathbf{v}_A$ is perpendicular to the cable at A and $\mathbf{v}_B$ is perpendicular to the cable at B.

If you are a student using this Manual, you are using it without permission.*

Kinematics.

To locate the instantaneous center C draw line $\overline{AC}$ perpendicular to $\mathbf{v}_A$ and line $\overline{BC}$ perpendicular to $\mathbf{v}_B$. Let point G be the mass center of the plank AB and Point S be that of the sphere.



$$\overline{CH} = L\cos 30° + r$$
$$= (0.500 \text{ m})\cos 30° + 0.040 \text{ m}$$
$$= 0.47301 \text{ m}$$

$$\overline{HS} = \frac{L}{2} - a = 0.21 \text{ m}$$

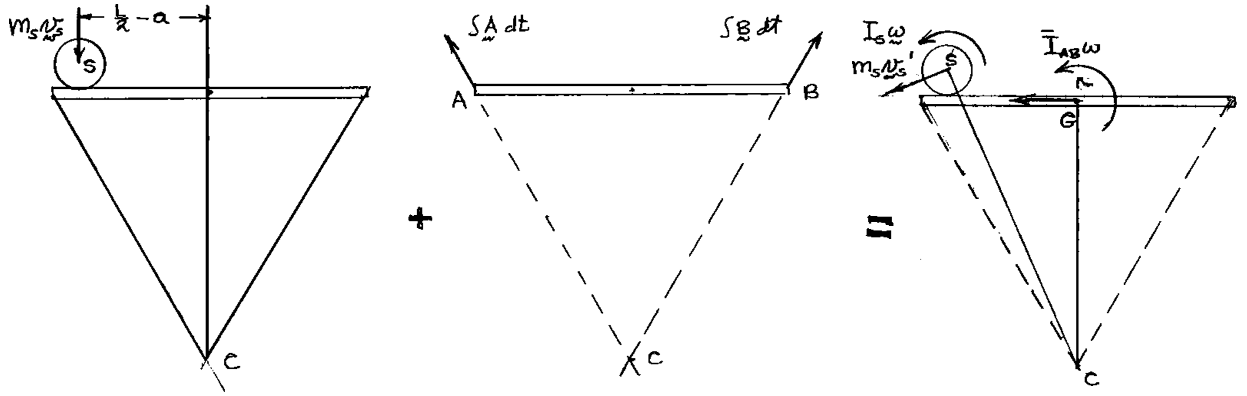
$$\overline{CS} = \sqrt{\overline{CH}^2 + \overline{HS}^2} = 0.51753 \text{ m}$$

$$\tan\beta = \frac{\overline{HS}}{CH} = 0.44397 \qquad \beta = 23.94°$$

$$v_S = (\overline{CS})\omega = 0.51753\omega$$

$$v_G = (L\cos 30°)\omega = 0.43301\omega$$

Principle of impulse and momentum.



Syst. Momenta$_1$ + **Syst. Ext. Imp.**$_{1\to 2}$ = **Syst. Momenta**$_2$

+↻ Moments about C:

$$m_S v_S\left(\frac{L}{2} - a\right) + 0 = m_S v_S^1(\overline{CS}) + m_{AB}v_G^1(CH) + \overline{I}_S\omega + \overline{I}_{AB}\omega$$

$$m_S v_S\left(\frac{L}{2} - a\right) = [m_S(\overline{CS})^2 + m_{AB}\overline{CG}^2 + \overline{I}_S + \overline{I}_{AB}]\omega = I_C\omega$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

where $$m_S v_S\left(\frac{L}{2}-a\right)=(2\text{ kg})(1.9809\text{ m/s})(0.21\text{ m})=0.83198\text{ kg}\cdot\text{m}^2/\text{s}$$

and $$I_C=(2\text{ kg})(0.51753\text{ m})^2+(4\text{ kg})(0.43301\text{ m})^2+1.28\times10^{-3}\text{ kg}\cdot\text{m}^2+83.333\times10^{-3}\text{ kg}\cdot\text{m}^2$$
$$=(0.53567+0.75+0.00128+0.08333)\text{ kg}\cdot\text{m}^2=1.37028\text{ kg}\cdot\text{m}^2$$

$$0.83198\text{ kg}\cdot\text{m}^2/\text{s}=(1.37028\text{ kg}\cdot\text{m}^2)\omega \qquad \boldsymbol{\omega}=0.60716\text{ rad/s} \circlearrowleft \blacktriangleleft$$

$$v_S^1=(0.51753\text{ m})(0.60716\text{ rad/s})=0.31422\text{ m/s}$$
$$v_G^1=(0.43301\text{ m})(0.60716\text{ rad/s})=0.26291\text{ m/s}$$

To check that neither cable becomes slack during the impact, we show that $\int A dt$ and $\int B\,dt$ are positive quantities.

$+\uparrow$ components: $$-m_S v_S+(\int Adt+\int Bdt)\cos 30^\circ=-mv_S^1\sin\beta$$
$$\frac{\sqrt{3}}{2}(\int Adt+\int Bdt)=[m_S v_S-m_S v_1^1\sin\beta]/\cos 30^\circ$$
$$=7.9236-(2)(0.31422)\sin 23.94^\circ$$
$$=7.6686\text{ N}\cdot\text{s}$$

$\overset{+}{\leftarrow}$ components: $$0+(\int Adt-\int Bdt)\sin 30^\circ=m_{AB}v_G^1+m_S v_S\cos\beta$$
$$\frac{1}{2}(\int Adt-\int Bdt)=(4)(0.26291)+(2)(0.31422)\cos 23.94^\circ$$
$$=1.6260\text{ N}\cdot\text{s}$$

Solving the simultaneous equation gives

$$\int Adt=6.05\text{ N}\cdot\text{s} \qquad \int Bdt=2.80\text{ N}\cdot\text{s}$$

The cables remain taut as assumed.

Velocity of sphere: $\mathbf{v}_S^1=0.314\text{ m/s} \measuredangle 23.9^\circ \blacktriangleleft$

PROBLEM 17.130

A large 3-lb sphere with a radius $r = 3$ in. is thrown into a light basket at the end of a thin, uniform rod weighing 2 lb and length $L = 10$ in. as shown. Immediately before the impact the angular velocity of the rod is 3 rad/s counterclockwise and the velocity of the sphere is 2 ft/s down. Assume the sphere sticks in the basket. Determine after the impact (*a*) the angular velocity of the bar and sphere, (*b*) the components of the reactions at *A*.

SOLUTION

Let Point *G* be the mass center of the sphere and Point *C* be that of the rod *AB*.

Rod *AB*: $W_{AB} = 2 \text{ lb.} \quad m_{AB} = \dfrac{2}{32.2} = 0.06211 \text{ lb} \cdot \text{s}^2/\text{ft}$

$$I_{AB} = \frac{1}{12} m_P L^2 = \frac{1}{12}(0.06211)\left(\frac{10}{12}\right)^2 = 0.003594 \text{ lb} \cdot \text{s}^2 \cdot \text{ft}$$

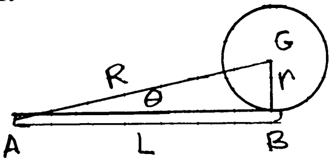
Sphere: $W_S = 3 \text{ lb} \quad m_S = \dfrac{3}{32.2} = 0.09317 \text{ lb} \cdot \text{s}^2/\text{ft}$

$$I_G = \frac{2}{5} m_S r^2 = \frac{2}{5}(0.09317)\left(\frac{3}{12}\right)^2 = 0.002329 \text{ lb} \cdot \text{s}^2 \cdot \text{ft}$$

Impact. Before impact, bar *AB* is rotating about *A* with angular velocity $\boldsymbol{\omega}_0 = \omega_0 \circlearrowleft$ ($\omega_0 = 3$ rad/s) and the sphere is falling with velocity $\mathbf{v}_0 = v_0 \downarrow$ ($v_0 = 2$ ft/s). After impact, the rod and the sphere move together, rotating about *A* with angular velocity $\boldsymbol{\omega} = \omega \circlearrowright$.

Geometry. $R = \sqrt{L^2 + r^2} = \sqrt{10^2 + 3^2} = 10.44 \text{ in.} = 0.8700 \text{ ft}$

$$\tan\theta = \frac{r}{L} = \frac{3}{10} \quad \theta = 16.7°$$



Kinematics: Before impact, $v_C = \dfrac{L}{2}\omega_0 = \left(\dfrac{5}{12}\right)(3) = 1.25 \text{ ft/s} \uparrow$

After impact, $\mathbf{v}_C = \dfrac{L}{2}\omega' \downarrow, \quad \mathbf{v}_G = R\omega' \searrow \theta$

Principle of impulse and momentum. Neglect weights of the rod and sphere over the duration of the impact.

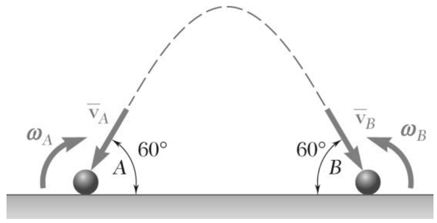
PROBLEM 17.131

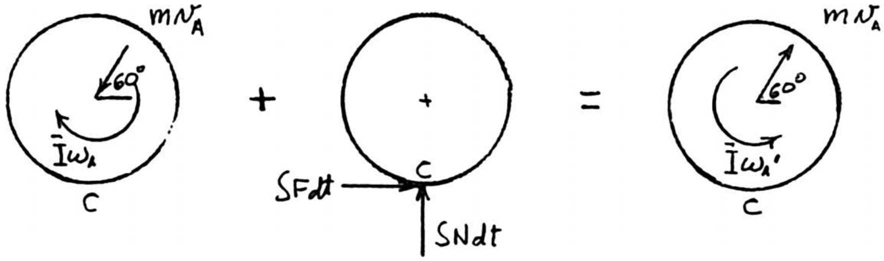


A small rubber ball of radius r is thrown against a rough floor with a velocity $\bar{\mathbf{v}}_A$ of magnitude v_0 and a backspin $\boldsymbol{\omega}_A$ of magnitude ω_0. It is observed that the ball bounces from A to B, then from B to A, then from A to B, etc. Assuming perfectly elastic impact, determine the required magnitude ω_0 of the backspin in terms of $\bar{v}_0$ and r.

SOLUTION

Moment of inertia. $\bar{I} = \frac{2}{5}mr^2$ Ball is assumed to be a solid sphere.

Impact at A.



Syst. Momenta$_1$ + **Syst. Ext. Imp.**$_{1\to2}$ = **Syst. Momenta**$_2$

For the velocity of the ball to be reversed on each impact,

$$v_A' = v_A = v_0$$
$$\omega_A' = \omega_A = \omega_0$$

This is consistent with the assumption of perfectly elastic impact.

↻ Moments about C: $mv_A r\cos 60° - \bar{I}\,\omega_A + 0 = \bar{I}\,\omega_A' - mv_A' r\cos 60°$

$$mv_0 r\cos 60° - \frac{2}{5}mr^2\omega_0 + 0 = \frac{2}{5}mr^2\omega_0 - mv_0 r\cos 60°$$

$$\frac{2}{5}r\omega_0 = v_0\cos 60°$$

$$\omega_0 = \frac{5}{4}\frac{v_0}{r} \blacktriangleleft$$

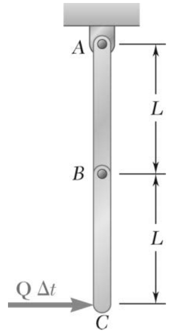
PROBLEM 17.134

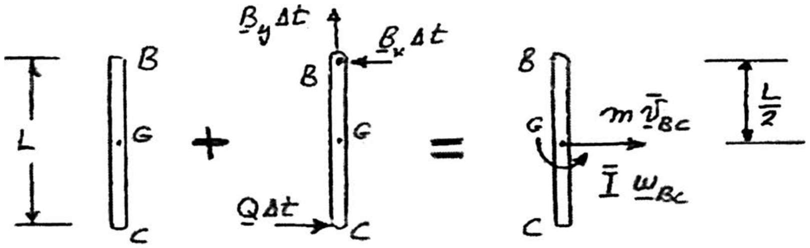


Each of the bars AB and BC is of length $L = 400$ mm and mass $m = 1.2$ kg. Determine the angular velocity of each bar immediately after the impulse $Q\Delta t = (1.5\text{ N}\cdot\text{s})\mathbf{i}$ is applied at C.

SOLUTION

Principle of impulse and momentum.

Bar BC:



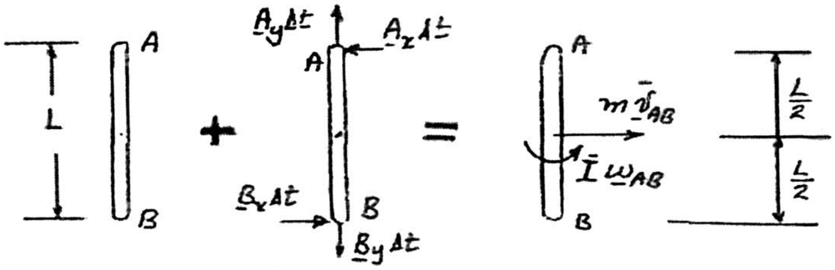
Syst. Momenta$_1$ + **Syst. Ext. Imp.**$_{1\to 2}$ = **Syst. Momenta**$_2$

Kinematics
$$\bar{v}_{BC} = v_B + \frac{L}{2}\omega_{BC} = L\omega_{AB} + \frac{L}{2}\omega_{BC}$$

+↻ Moments about B:
$$0 + (Q\Delta t)L = \bar{I}\,\omega_{BC} + m\bar{v}_{BC}\frac{L}{2}$$
$$(Q\Delta t)L = \frac{1}{12}mL^2\omega_{BC} + m\left(L\omega_{AB} + \frac{L}{2}\omega_{BC}\right)\frac{L}{2}$$
$$Q\Delta t = \frac{1}{2}mL\omega_{AB} + \frac{1}{3}mL\omega_{BC} \qquad (1)$$

$\xrightarrow{+}$ x components:
$$Q\Delta t - B_x\Delta t = m\left(L\omega_{AB} + \frac{L}{2}\omega_{BC}\right) \qquad (2)$$

Bar AB:



Syst. Momenta$_1$ + **Syst. Ext. Imp.**$_{1\to 2}$ = **Syst. Momenta**$_2$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

$+\circlearrowleft$ Moments about *A:*

$$0 + (B_x \Delta t)L = \bar{I}\,\omega_{AB} + m\bar{v}_{AB}\frac{L}{2}$$

$$(B_x \Delta t)L = \frac{1}{12}mL^2\omega_{AB} + m\left(\frac{L}{2}\omega_{AB}\right)\frac{L}{2}$$

$$B_x \Delta t = \frac{1}{3}mL\omega_{AB} \qquad (3)$$

We now have 3 unknowns ($B_x \Delta t_1$, ω_{AB}, and ω_{BC}) and 3 equations.

Add Eqs. (2) and (3):

$$Q\Delta t = \frac{4}{3}mL\omega_{AB} + \frac{1}{2}mL\omega_{BC} \qquad (4)$$

Subtract Eq. (1) from Eq. (4):

$$0 = \frac{5}{6}mL\omega_{AB} + \frac{1}{6}mL\omega_{BC}$$

$$\omega_{BC} = -5\omega_{AB} \qquad (5)$$

Substitute for ω_{BC} in Eq. (1):

$$Q\Delta t = \frac{1}{2}mL\omega_{AB} + \frac{1}{3}mL(-5\omega_{AB})$$

$$= -\frac{7}{6}mL\omega_{AB}$$

$$\omega_{AB} = -\frac{6}{7}\frac{Q\Delta t}{mL} \qquad (6)$$

Substituting into Eq. (5):

$$\omega_{BC} = -5\left(-\frac{6}{7}\frac{Q\Delta t}{mL}\right)$$

$$\omega_{BC} = \frac{30}{7}\frac{Q\Delta t}{mL} \qquad (7)$$

Given data:

$$L = 0.400 \text{ m}$$

$$Q\Delta t = 1.5 \text{ N}\cdot\text{s}$$

$$m = 1.2 \text{ kg}$$

<u>Angular velocity of bar *AB*.</u>

$$\omega_{AB} = -\frac{6}{7}\frac{Q\Delta t}{mL} = -\frac{(6)(1.5)}{(7)(1.2)(0.4)}$$

$\boldsymbol{\omega}_{AB} = 2.68$ rad/s $\circlearrowright$ ◀

<u>Angular velocity of bar *BC*.</u>

$$\omega_{BC} = \frac{30}{7}\frac{Q\Delta t}{mL} = \frac{(30)(1.5)}{(7)(1.2)(0.4)}$$

$\boldsymbol{\omega}_{BC} = 13.39$ rad/s $\circlearrowleft$ ◀

PROBLEM 17.138

The gear shown has a radius R = 150 mm and a radius of gyration $\bar{k} = 125$ mm. The gear is rolling without sliding with a velocity $\bar{\mathbf{v}}_1$ of magnitude 3 m/s when it strikes a step of height h = 75 mm. Because the edge of the step engages the gear teeth, no slipping occurs between the gear and the step. Assuming perfectly plastic impact, determine (a) the angular velocity of the gear immediately after the impact, (*b*) the angular velocity of the gear after it has rotated to the top of the step.

SOLUTION

Part (*a*) Conditions just after impact.

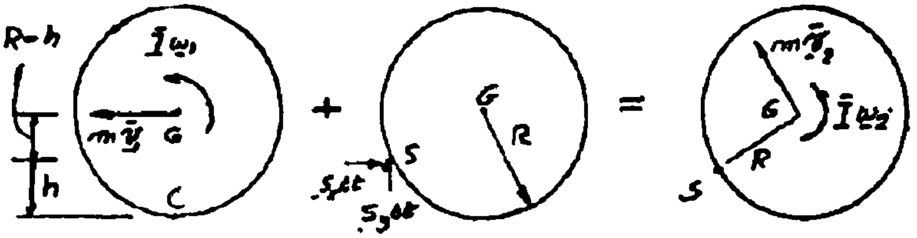
Kinematics. Just before impact, the contact Point C with the floor the instantaneous center of rotation of the gear.

$$\bar{\mathbf{v}}_1 = R\omega_1 \longleftarrow$$

Just after impact, Point S is the instantaneous center of rotation.

$$\mathbf{v}_2 = R\omega_2 \measuredangle\, \theta \quad \text{(perpendicular to } GS\text{)}$$

Principle of impulse and momentum.



$+\circlearrowleft$ Moments about S: $\quad m\bar{v}_2(R-h) + \bar{I}\omega_1 = m\bar{v}_2 R + \bar{I}\omega_2$

$$m(R\omega_1)(R-h) + m\bar{k}^2\omega_1 = m(R\omega_2)R + m\bar{k}^2\omega_2$$

$$[R(R-h) + \bar{k}^2]\omega_1 = (R^2 + \bar{k}^2)\omega_2$$

$$\omega_2 = \frac{R^2 + \bar{k}^2 - Rh}{R^2 + k^2}\omega_1 \qquad \omega_2 = \left[1 - \frac{Rh}{R^2 + k^2}\right]\omega_1 \tag{1}$$

Data: $\quad R = 150 \text{ mm}, \quad \bar{k} = 125 \text{ mm}, \quad v_1 = 3 \text{ m/s}, \quad h = 75 \text{ mm}$

$$\omega_1 = \frac{v_1}{R} = \frac{3 \text{ m/s}}{0.150 \text{ m}} = 20 \text{ rad/s}$$

Angular velocity.

From (1), $\quad \omega_2 = \left[1 - \frac{(150)(75)}{(150^2 + 125^2)}\right](20 \text{ rad/s}) = 0.7049(20) \qquad \boldsymbol{\omega}_2 = 14.10 \text{ rad/s} \circlearrowleft$ ◀

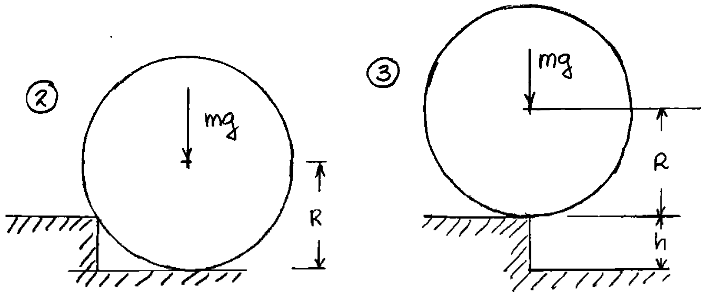
If you are a student using this Manual, you are using it without permission.*

Part (*b*) Conditions at the top of the step.

The gear pivots about the edge of the step. Use the principle of conservation of energy.

Position (2): The gear has just broken contact with the floor.

Position (3): The center of the gear is above the edge of the step.



Kinematics: (Rotation about S) $\bar{v} = \omega R$

Kinetic energy:

$$T = \frac{1}{2}\bar{I}\omega^2 + \frac{1}{2}m\bar{v}^2$$

$$= \frac{1}{2}m\bar{k}^2\omega^2 + \frac{1}{2}mR^2\omega^2$$

$$= \frac{1}{2}m(\bar{k}^2 + R^2)\omega^2$$

Position (2):

$$T_2 = \frac{1}{2}m(\bar{k}^2 + R^2)\omega_2^2$$

$$V_2 = mgR$$

Position (3):

$$T_3 = \frac{1}{2}m(\bar{k}^2 + R^2)\omega_3^2$$

$$V_3 = mg(R + h)$$

Principle of conservation of energy: $T_2 + V_2 = T_3 + V_3$

$$\frac{1}{2}m(\bar{k}^2 + R^2)\omega_2^2 + mgR = \frac{1}{2}m(\bar{k}^2 + R^2)\omega_3^2 + mg(R + h)$$

Angular velocity:

$$\omega_3^2 = \omega_3^2 - \frac{2gh}{\bar{k}^2 + R^2}$$

$$= (14.10 \text{ rad/s})^2 - \frac{(2)(9.81 \text{ m/s}^2)(0.075 \text{ m})}{(0.125 \text{ m})^2 + (0.150 \text{ m})^2}$$

$$= 160.21 \text{ rad}^2/\text{s}^2$$

$\boldsymbol{\omega}_3 = 12.66 \text{ rad/s}$ ↺ ◀

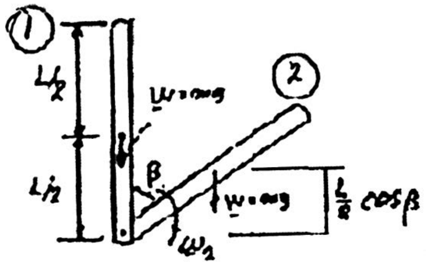
PROBLEM 17.139

A uniform slender rod is placed at corner B and is given a slight clockwise motion. Assuming that the corner is sharp and becomes slightly embedded in the end of the rod, so that the coefficient of static friction at B is very large, determine (*a*) the angle β through which the rod will have rotated when it loses contact with the corner, (*b*) the corresponding velocity of end A.

SOLUTION



Position 1

$$T_1 = 0$$

$$V_1 = mgh_1 = \frac{mgL}{2}$$

Position 2

$$V_2 = mgh_2 = \frac{mgL\cos\beta}{2}$$

$$T_2 = \frac{1}{2}I\omega_2^2 = \frac{1}{2}\left(\frac{1}{3}mL^2\right)\omega_2^2$$

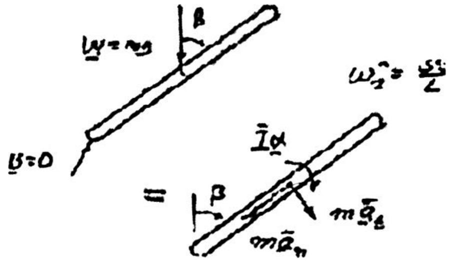
Principle of conservation of energy.

$$T_1 + V_1 = T_2 + V_2$$

$$0 + \frac{mgL}{2} = \frac{1}{2}\left(\frac{1}{3}mL^2\right)\omega_2^2 + \frac{mgL\cos\beta}{2}$$

$$\omega_2^2 = \frac{3g}{L}(1-\cos\beta) \qquad (1)$$

Normal acceleration of mass center.



$$a_n = \frac{L}{2}\omega_2^2 = \frac{3}{2}g(1-\cos\beta)$$

$$+\swarrow \Sigma F = +\Sigma F_{\text{eff}} = ma_n$$

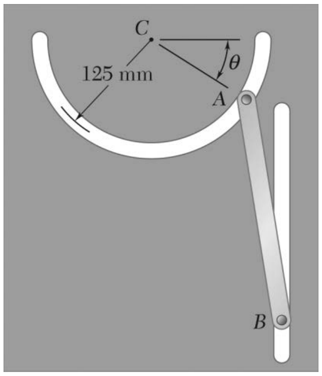
$$mg\cos\beta = \frac{3}{2}mg(1-\cos\beta)$$

(*a*) Angle β. $\quad \frac{5}{2}\cos\beta = \frac{3}{2} \qquad \cos\beta = 0.6$ $\qquad \beta = 53.1° \blacktriangleleft$

From (1) $\quad \omega_2^2 = \frac{3g}{L}(1-0.6) = 1.2\frac{g}{L} \qquad \omega_2 = 1.09545\sqrt{\frac{g}{L}}$

(*b*) Velocity of end A $\quad v_A = L\omega_2$ $\qquad \mathbf{v}_A = 1.095\sqrt{gL} \nwarrow 53.1° \blacktriangleleft$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. If you are a student using this Manual, you are using it without permission.*



PROBLEM 17.140

The motion of the slender 250-mm rod AB is guided by pins at A and B that slide freely in slots cut in a vertical plate as shown. Knowing that the rod has a mass of 2 kg and is released from rest when $\theta = 0$, determine the reactions at A and B when $\theta = 90°$.

SOLUTION

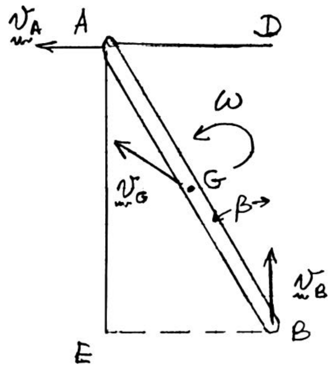
Let Point G be the mass center of rod AB.

$$m = 2 \text{ kg}$$

$$L = 0.25 \text{ m}$$

$$I_G = \frac{1}{12}mL^2 = 0.0104667 \text{ kg}\cdot\text{m}^2$$

Kinematics. $\theta = 90°$



$$\overline{AD} = R = 0.125 \text{ m}$$

$$AB = L = 0.25 \text{ m}$$

$$\sin\beta = \frac{R}{L} = \frac{1}{2} \qquad \beta = 30°$$

$$\overline{AG} = \frac{L}{2} = 0.125 \text{ m}$$

$$\overline{BG} = 0.125 \text{ m}$$

Point E is the instantaneous center of rotation of bar AB.

$$v_G = \frac{L}{2}\omega = 0.125\ \omega$$

$$v_A = (L\cos 30°)\omega = 0.21651\omega$$

$$v_B = (L\sin 30°)\omega = 0.125\omega$$

Use principle of conservation of energy to obtain the velocities when $\theta = 90°$:

Use level A as the datum for potential energy.

Position 1 $\theta = 0$

$$T_1 = 0$$

$$V_1 = -mg\frac{L}{2} = -(2)(9.81)(0.125) = -2.4525 \text{ J}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

Position 2 $\theta = 90°$

$$T_2 = \frac{1}{2}I_G\omega^2 + \frac{1}{2}mv_G^2$$
$$= \frac{1}{2}(0.0104667)\omega^2 + \frac{1}{2}(2)(0.125\omega)^2$$
$$= 0.0208583\omega^2$$
$$V_2 = -mg\left(R + \frac{L}{2}\cos\beta\right)$$
$$= -(2)(9.81)(0.125 + 0.125\cos 30°)$$
$$= -4.5764 \text{ J}$$

$T_1 + V_1 = T_2 + V_2$: $\quad 0 - 2.4525 = 0.0208583\omega^2 - 4.5764$

$$\omega^2 = 101.826 \text{ rad}^2/\text{s}^2$$
$$\omega = 10.091 \text{ rad/s}$$
$$v_A = (0.21651)(10.091)$$
$$= 2.1848 \text{ m/s}$$
$$v_G = (0.125)(10.091)$$
$$= 1.2614 \text{ m/s}$$

More kinematics: For Point A moving in the curved slot,

$$\mathbf{a}_A = (a_C)_x\mathbf{i} + \frac{v_A^2}{R}\mathbf{j}$$
$$= (a_C)_x\mathbf{i} + \frac{(2.1847)^2}{0.125}\mathbf{j}$$
$$= (a_C)_x\mathbf{i} + 38.1833\mathbf{j}$$

For the rod AB, $\boldsymbol{\alpha} = \alpha\mathbf{k}, \quad \mathbf{v}_B = v_B\mathbf{j}$

$$\mathbf{r}_{A/B} = -L\sin 30°\mathbf{i} + L\cos 30°\mathbf{j}$$
$$= -0.125\mathbf{i} + 0.21651\mathbf{j}$$
$$\mathbf{r}_{G/B} = \frac{1}{2}\mathbf{r}_{A/B}$$
$$= -0.0625\mathbf{i} + 0.108253\mathbf{j}$$
$$\mathbf{a}_A = \mathbf{a}_B + \boldsymbol{\alpha} + \mathbf{r}_{A/B} - \omega^2\mathbf{r}_{A/B}$$
$$= a_B\mathbf{j} + \alpha\mathbf{k} \times (-0.125\mathbf{i} + 0.21651\mathbf{j})$$
$$-(10.091)^2(-0.125\mathbf{i} + 0.21651\mathbf{j})$$
$$= a_B\mathbf{j} - 0.125\alpha\mathbf{j} - 0.21651\alpha\mathbf{i} + 12.7285\mathbf{i} - 22.0468\mathbf{j}$$

PROBLEM 17.141

A 35-g bullet B is fired horizontally with a velocity of 400 m/s into the side of a 3-kg square panel suspended from a pin at A. Knowing that the panel is initially at rest, determine the components of the reaction at A after the panel has rotated 45°.

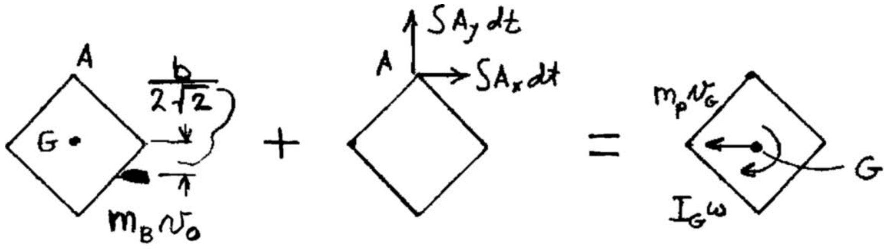
SOLUTION

Masses and moment of inertia.

$$m_B = 0.035 \text{ kg}$$
$$m_P = 3 \text{ kg}$$
$$b = 500 \text{ mm} = 0.5 \text{ m}$$
$$I_G = \frac{1}{6} m_P b^2 = \frac{1}{6}(3)(0.5)^2 = 0.125 \text{ kg} \cdot \text{m}^2$$

Note: The mass of the bullet is neglected in comparison with that of the plate after impact.

Analysis of impact: Use principle of impulse and momentum.



Kinematics: After impact the plate rotates about the pin at A.

$$v_G = \frac{b}{\sqrt{2}}\omega = \frac{0.5}{\sqrt{2}}\omega$$

+↻ Moments about A:

$$m_B v_0 \left(\frac{b}{\sqrt{2}} + \frac{b}{2\sqrt{2}} \right) = I_G \omega + m_p v_G \frac{b}{\sqrt{2}}$$

$$\frac{3}{2\sqrt{2}} m_G v_0 b = (I_G + \frac{1}{2} m_P b^2)\omega$$

$$\frac{3}{2\sqrt{2}}(0.035)(400)(0.5) = \left[0.125 + \frac{1}{2}(3)(0.5)^2 \right]\omega$$

$$\omega = 14.8492 \text{ rad/s}$$

$$v_G = \frac{0.5}{\sqrt{2}}(14.8492) = 5.25 \text{ m/s}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 17.141 (Continued)

Corresponding kinetic energy. $T_1 = \frac{1}{2} I_G \omega^2 + \frac{1}{2} m_P v_G^2$

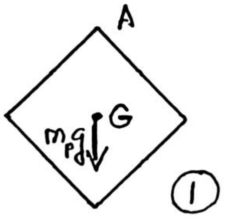
$$T_1 = \frac{1}{2}(0.125)(14.8492)^2 + \frac{1}{2}(3)(5.25)^2$$
$$= 55.125 \text{ J}$$

Plate rotates through $45°$.

Position 1: $\theta = 0°$

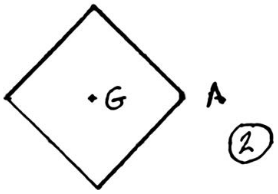
Use Point A as the datum for potential energy.

$$V_1 = -m_P g \frac{b}{\sqrt{2}}$$
$$= -(3)(9.81)\frac{0.5}{\sqrt{2}}$$
$$= -10.4051 \text{ J}$$



Position 2: $\theta = 90°$

$V_2 = 0$ since G is at level A.



$$T_2 = \frac{1}{2} I_G \omega_2^2 + \frac{1}{2} m_P (v_G)_2^2$$
$$= \frac{1}{2}(0.125)\omega_2^2 + \frac{1}{2}(3)\left(\frac{0.5}{\sqrt{2}}\omega_2\right)^2$$
$$= 0.25\omega_2^2$$

Principle of conservation of energy:

$$T_1 + V_1 = T_2 + V_2$$
$$55.125 \text{ J} - 10.4051 \text{ J} = 0.25\omega_2^2 + 0$$
$$\omega_2^2 = 178.879 \text{ (rad/s}^2\text{)}$$
$$\omega_2 = 13.3746 \text{ rad/s}$$

Analysis at $90°$ rotation. $\boldsymbol{\alpha} = \alpha \circlearrowleft$

Kinematics: $(a_G)_t = \frac{b}{\sqrt{2}}\alpha = \frac{0.5}{\sqrt{2}}\alpha$ $\qquad (\mathbf{a}_G)_t = 0.35355\alpha \downarrow$

$$(a_G)_n = \frac{b}{\sqrt{2}}\omega^2$$
$$= \frac{(0.5)(178.879)}{\sqrt{2}}$$

$(\mathbf{a}_G)_n = 63.2434 \text{ m/s}^2 \longrightarrow$

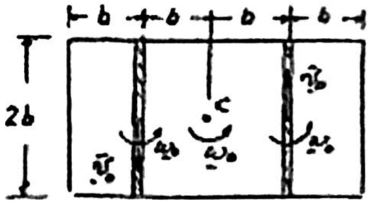
PROBLEM 17.142

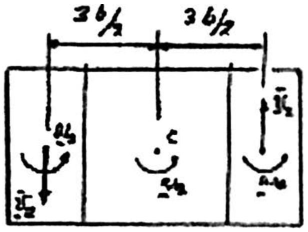
Two panels A and B are attached with hinges to a rectangular plate and held by a wire as shown. The plate and the panels are made of the same material and have the same thickness. The entire assembly is rotating with an angular velocity $\boldsymbol{\omega}_0$ when the wire breaks. Determine the angular velocity of the assembly after the panels have come to rest against the plate.

SOLUTION

Geometry and kinematics:



Panels in up position



Panels in down position

$$\bar{v}_0 = b\omega_0 \qquad \bar{v}_2 = \frac{3}{2}b\omega_0$$

Let ρ = mass density, t = thickness

Plate:

$$m_{\text{plate}} = \rho t(2b)(4b) = 8\rho t b^2$$

$$\bar{I}_{\text{plate}} = \frac{1}{12}(8\rho t b^2)[(2b)^2 + (4b)^2]$$

$$= \frac{160}{12}\rho t b^4$$

$$= \frac{40}{3}\rho t b^4$$

Each panel:

$$m_{\text{panel}} = \rho t(b)(2b) = 2\rho t b^2$$

Panel in up position

$$(\bar{I}_{\text{panel}})_0 = \frac{1}{12}(2\rho t b^2)(2b)^2$$

$$= \frac{8}{12}\rho t b^4 = \frac{2}{3}\rho t b^4$$

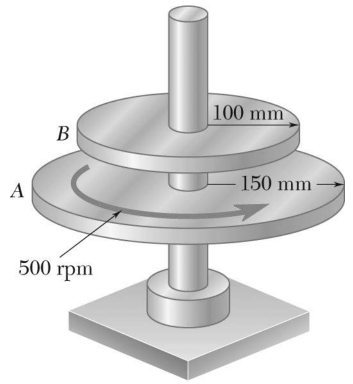
PROBLEM 17.143



Disks A and B are made of the same material and are of the same thickness; they can rotate freely about the vertical shaft. Disk B is at rest when it is dropped onto disk A, which is rotating with an angular velocity of 500 rpm. Knowing that disk A has a mass of 8 kg, determine (a) the final angular velocity of the disks, (b) the change is kinetic energy of the system.

SOLUTION

Disk A: $m_A = 8 \text{ kg} \quad r_A = 0.15 \text{ m}$

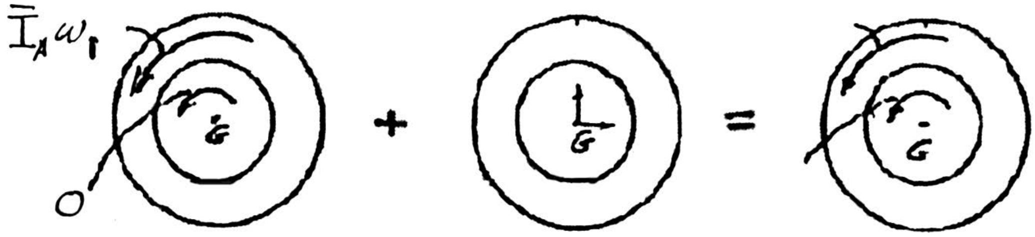
$$\bar{I}_A = \frac{1}{2}m_A r_A^2 = \frac{1}{2}(8)(0.15)^2 = 0.0900 \text{ kg}\cdot\text{m}^2$$

Disk B: $r_B = 0.100 \text{ m}$

$$m_B = m_A\left(\frac{r_B}{r_A}\right)^2 = (8)\left(\frac{0.10}{0.15}\right)^2 = 3.5556 \text{ kg}$$

$$\bar{I}_B = \frac{1}{2}m_B r_B^2 = \frac{1}{2}(3.5556)(0.10)^2 = 0.017778 \text{ kg}\cdot\text{m}^2$$

Principle of impulse and momentum.



Syst. Momenta$_1$ + **Syst. Ext. Imp.** $_{1\to 2}$ = **Syst. Momenta**$_2$

$+\circlearrowright$ Moments about B: $\bar{I}_A\omega_0 + 0 + 0 = \bar{I}_A\omega_2 + \bar{I}_B\omega_2$

$$\omega_2 = \frac{\bar{I}_A}{\bar{I}_A + \bar{I}_B}\omega_1 = \frac{0.09}{0.10778}\omega_1 = 0.83505\omega_1$$

Initial angular velocity of disk A: $\omega_1 = 500 \text{ rpm} = 52.36 \text{ rad/s}$

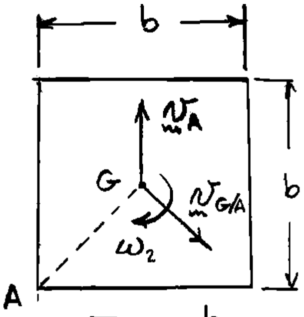
PROBLEM 17.144

A square block of mass m is falling with a velocity $\bar{\mathbf{v}}_1$ when it strikes a small obstruction at B. Knowing that the coefficient of restitution for the impact between corner A and the obstruction B is $e = 0.5$, determine immediately after the impact (a) the angular velocity of the block, (b) the velocity of its mass center G.

SOLUTION

Moments of inertia. $\bar{I} = \frac{1}{6}mb^2$



Kinematics. Before impact, block is translating.

$$\mathbf{v}_1 = v_1 \downarrow \quad \omega_1 = 0$$

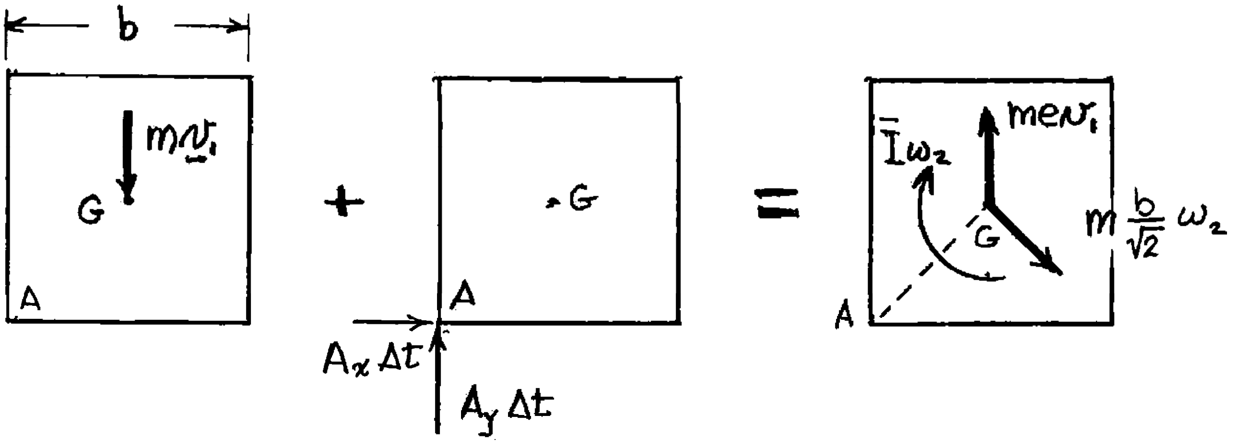
After impact,

$$\mathbf{v}_A = ev_1 \uparrow$$

$$\bar{\mathbf{v}}_2 = \mathbf{v}_A + \mathbf{v}_{G/A}$$

$$= [ev_1 \uparrow] + \left[\frac{b}{\sqrt{2}}\omega_2 \searrow 45°\right] \qquad \overline{AG} = \frac{b}{\sqrt{2}} \qquad (1)$$

Principle of impulse and momentum.



Syst. Momenta$_1$ + **Syst. Ext. Imp.** $_{1\to2}$ = **Syst. Momenta**$_2$

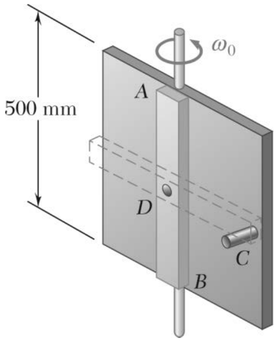
PROBLEM 17.145



A 3-kg bar *AB* is attached by a pin at *D* to a 4-kg square plate, which can rotate freely about a vertical axis. Knowing that the angular velocity of the plate is 120 rpm when the bar is vertical, determine (*a*) the angular velocity of the plate after the bar has swung into a horizontal position and has come to rest against pin *C*, (*b*) the energy lost during the plastic impact at *C*.

SOLUTION

Moments of inertia about the vertical centroidal axis.

Square plate. $\bar{I} = \frac{1}{12}mL^2 = \frac{1}{12}(4)(0.500)^2 = 0.083333 \text{ kg}\cdot\text{m}^2$

Bar *AB* vertical. $\bar{I} = \text{approximately zero}$

Bar *AB* horizontal. $\bar{I} = \frac{1}{12}mL^2 = \frac{1}{12}(3)(0.500)^2 = 0.0625 \text{ kg}\cdot\text{m}^2$

Position 1. Bar *AB* is vertical. $I_1 = 0.083333 \text{ kg}\cdot\text{m}^2$

Angular velocity. $\omega_1 = 120 \text{ rpm} = 4\pi \text{ rad/s}$

Angular momentum about the vertical axis.

$$(H_O)_1 = I_1\omega_1 = (0.083333)(4\pi) = 1.04720 \text{ kg}\cdot\text{m}^2\text{/s}$$

Kinetic energy. $T_1 = \frac{1}{2}I_1\omega_1^2 = \frac{1}{2}(0.083333)(4\pi)^2 = 6.5797 \text{ J}$

Position 2. Bar *AB* is horizontal. $I_2 = 0.145833 \text{ kg}\cdot\text{m}^2$

$$(H_O)_2 = I_2\omega_2 = 0.145833\omega_2$$

Conservation of angular momentum. $(H_O)_1 = (H_O)_2$:

$$1.04720 = 0.145833\omega_2 \qquad \omega_2 = 7.1808 \text{ rad/s}$$

(*a*) Final angular velocity. $\omega_2 = 68.6 \text{ rpm}$ ◀

(*b*) Loss of energy.

$$T_1 - T_2 = T_1 - \frac{1}{2}I_2\omega_2^2 = 6.5797 - \frac{1}{2}(0.145833)(7.1808)^2$$

$T_1 - T_2 = 2.82 \text{ J}$ ◀

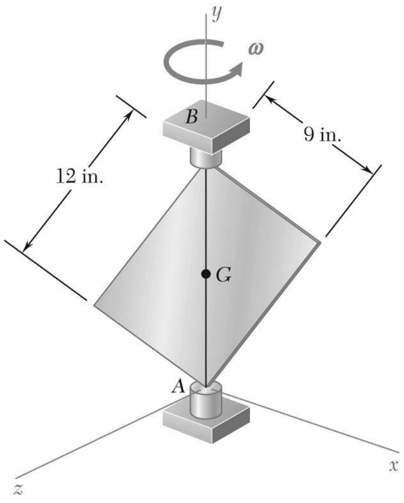
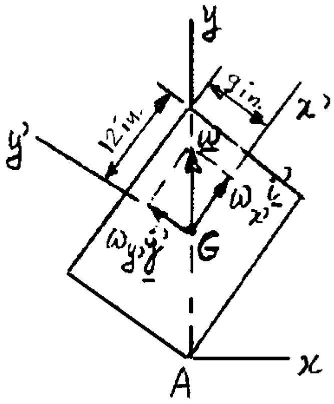
PROBLEM 18.2



A thin rectangular plate of weight 15 lb rotates about its vertical diagonal *AB* with an angular velocity ω. Knowing that the z axis is perpendicular to the plate and that ω is constant and equal to 5 rad/s, determine the angular momentum of the plate about its mass center *G*.

SOLUTION



$$h = \sqrt{(9\text{ in.})^2 + (12\text{ in.})^2} = 15\text{ in.}$$

Resolving ω along the principal axes x', y', z:

$$\omega_{x'} = \frac{12}{15}\omega = 0.8(5\text{ rad/s}) = 4\text{ rad/s}$$

$$\omega_{y'} = \frac{9}{15}\omega = 0.6(5\text{ rad/s}) = 3\text{ rad/s}$$

$$\omega_z = 0$$

Moments of inertia:

$$I_{x'} = \frac{1}{12}\left(\frac{15\text{ lb}}{32.2}\right)\left(\frac{9}{12}\text{ ft}\right)^2 = 0.021836\text{ slug}\cdot\text{ft}^2$$

$$I_{y'} = \frac{1}{12}\left(\frac{15\text{ lb}}{32.2}\right)\left(\frac{12}{12}\text{ ft}\right)^2 = 0.038820\text{ slug}\cdot\text{ft}^2$$

From Eqs. (18.10):

$$H_{x'} = I_{x'}\omega_{x'} = (0.021836)(4) = 0.087345\text{ slug}\cdot\text{ft}^2/\text{s}$$

$$H_{y'} = I_{y'}\omega_{y'} = (0.038820)(3) = 0.11646\text{ slug}\cdot\text{ft}^2/\text{s}$$

$$H_{z'} = I_z\omega_z = 0$$

$$\mathbf{H}_G = (0.087345\text{ slug}\cdot\text{ft}^2/\text{s})\mathbf{i}' + (0.11646\text{ slug}\cdot\text{ft}^2/\text{s})\mathbf{j}'$$

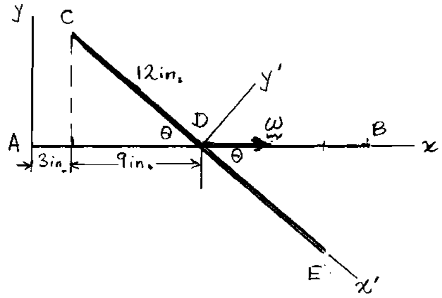
PROBLEM 18.3

Two uniform rods *AB* and *CE*, each of weight 3 lb and length 2 ft, are welded to each other at their midpoints. Knowing that this assembly has an angular velocity of constant magnitude $\omega = 12$ rad/s, determine the magnitude and direction of the angular momentum $\mathbf{H}_D$ of the assembly about *D*.

SOLUTION



$$m = \frac{W}{g} = \frac{3}{32.2} = 0.093168 \text{ lb}\cdot\text{s}^2/\text{ft}, \qquad l = 2 \text{ ft},$$

$$\boldsymbol{\omega} = (12 \text{ rad/s})\mathbf{i}$$

For rod *ADB*, $\mathbf{H}_D = \bar{I}_x \omega \mathbf{i} \approx 0$, since $\bar{I}_x \approx 0$.

For rod *CDE*, use principal axes x', y' as shown.

$$\cos\theta = \frac{9}{12}, \qquad \theta = 41.410°$$

$$\omega_{x'} = \omega\cos\theta = 9 \text{ rad/s}^2$$

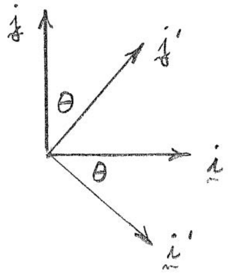
$$\omega_{y'} = \omega\sin\theta = 7.93725 \text{ rad/s}^2$$

$$\omega_{z'} = 0$$

$$\bar{I}_{x'} \approx 0$$

$$\bar{I}_{y'} = \frac{1}{12}ml^2 = \frac{1}{12}(0.093168)(2)^2$$

$$= 0.0310559 \text{ lb}\cdot\text{s}^2\cdot\text{ft}$$



$$\mathbf{H}_D = \bar{I}_{x'}\omega_{x'}\mathbf{i}' + \bar{I}_{y'}\omega_{y'}\mathbf{j}' + \bar{I}_{z'}\omega_{z'}\mathbf{k}'$$

$$= 0 + (0.0310559)(7.93725)\mathbf{j}' + 0$$

$$= 0.246498\mathbf{j}'$$

$$H_D = 0.246 \text{ lb}\cdot\text{s}\cdot\text{ft} \blacktriangleleft$$

$$\mathbf{H}_D = 0.246498(\sin\theta\mathbf{i} + \cos\theta\mathbf{j}) = 0.163045\mathbf{i} + 0.184874\mathbf{j}$$

$$\cos\theta_x = \frac{0.163045}{0.246498} \qquad \theta_x = 48.6° \blacktriangleleft$$

$$\cos\theta_y = \frac{0.184874}{0.246498} \qquad \theta_y = 41.4° \blacktriangleleft$$

$$\cos\theta_z = 0 \qquad \theta_z = 90° \blacktriangleleft$$

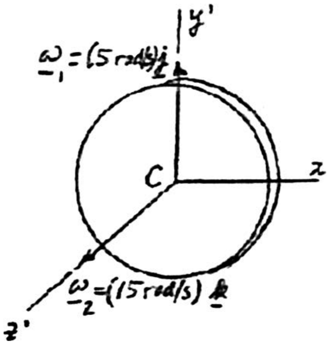
PROBLEM 18.5

A thin disk of mass $m = 4$ kg rotates at the constant rate $\omega_2 = 15$ rad/s with respect to arm *ABC*, which itself rotates at the constant rate $\omega_1 = 5$ rad/s about the *y* axis. Determine the angular momentum of the disk about its center *C*.

SOLUTION



$$r = 150 \text{ mm}$$

Angular velocity of disk:

$$\boldsymbol{\omega} = \omega_1 \mathbf{j} + \omega_2 \mathbf{k}$$
$$= (5 \text{ rad/s})\mathbf{j} + (15 \text{ rad/s})\mathbf{k}$$

Centroidal moments of inertia:

$$\bar{I}_{x'} = \bar{I}_{y'} = \frac{1}{4} m r^2$$
$$= \frac{1}{4}(4)(0.150 \text{ m})^2 = 0.0225 \text{ kg}\cdot\text{m}^2$$
$$\bar{I}_{z'} = \frac{1}{2} m r^2 = 0.045 \text{ kg}\cdot\text{m}^2$$

Angular momentum about Point *C*.

$$\mathbf{H}_C = \bar{I}_{x'}\omega_{x'}\mathbf{i} + \bar{I}_{y'}\omega_{y'}\mathbf{j} + I_{z'}\omega_{z'}\mathbf{k}$$
$$= 0 + (0.0225)(5)\mathbf{j} + (0.045)(15)\mathbf{k}$$
$$= (0.1125 \text{ kg}\cdot\text{m}^2/\text{s})\mathbf{j} + (0.6750 \text{ kg}\cdot\text{m}^2/\text{s})\mathbf{k}$$

$$\mathbf{H}_C = (0.1125 \text{ kg}\cdot\text{m}^2/\text{s})\mathbf{j} + (0.675 \text{ kg}\cdot\text{m}^2/\text{s})\mathbf{k} \blacktriangleleft$$

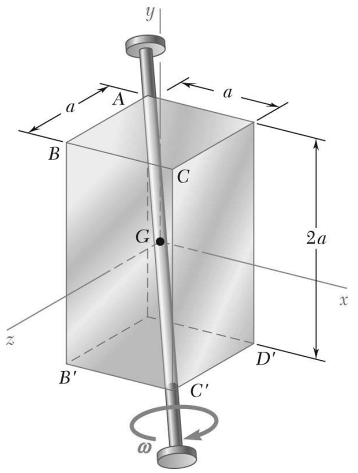
PROBLEM 18.6



A solid rectangular parallelepiped of mass m has a square base of side a and a length $2a$. Knowing that it rotates at the constant rate ω about its diagonal AC' and that its rotation is observed from A as counterclockwise, determine (a) the magnitude of the angular momentum $\mathbf{H}_G$ of the parallelepiped about its mass center G, (b) the angle that $\mathbf{H}_G$ forms with the diagonal AC'.

SOLUTION

Body diagonal: $d = \sqrt{a^2 + (2a)^2 + a^2} = \sqrt{6}a$

$$\boldsymbol{\omega} = \frac{\omega}{d}(-a\mathbf{i} + 2a\mathbf{j} - a\mathbf{k}) = -\frac{\omega}{\sqrt{6}}\mathbf{i} + \frac{2\omega}{\sqrt{6}}\mathbf{j} - \frac{\omega}{\sqrt{6}}\mathbf{k}$$

$$I_x = \frac{1}{12}m[(2a)^2 + a^2] = \frac{5}{12}ma^2$$

$$I_y = \frac{1}{12}m[a^2 + a^2] = \frac{1}{6}ma^2$$

$$I_z = \frac{1}{12}m[a^2 + (2a)^2] = \frac{5}{12}ma^2$$

(a)

$$\mathbf{H}_G = I_x\omega_x\mathbf{i} + I_y\omega_y\mathbf{j} + I_z\omega_z\mathbf{k}$$

$$= \left(\frac{5}{12}ma^2\right)\left(-\frac{\omega}{\sqrt{6}}\right)\mathbf{i} + \left(\frac{1}{6}ma^2\right)\left(\frac{2\omega}{\sqrt{6}}\right)\mathbf{j} + \left(\frac{5}{12}ma^2\right)\left(-\frac{\omega}{\sqrt{6}}\right)\mathbf{k}$$

$$= \frac{ma^2\omega}{12\sqrt{6}}(-5\mathbf{i} + 4\mathbf{j} - 5\mathbf{k})$$

$$H_G = \frac{ma^2\omega}{12\sqrt{6}}\sqrt{5^2 + 4^2 + 5^2} = \frac{\sqrt{11}ma^2\omega}{12}$$

$\mathbf{H}_G = 0.276\ ma^2\omega$ ◀

(b)

$$\mathbf{H}_G \cdot \boldsymbol{\omega} = \frac{ma^2\omega^2}{(12)(6)}(-5\mathbf{i} + 4\mathbf{j} - 5\mathbf{k}) \cdot (-\mathbf{i} + 2\mathbf{j} - \mathbf{k})$$

$$= \frac{18ma^2\omega^2}{(12)(6)} = \frac{1}{4}ma^2\omega$$

$$H_G\omega = \frac{\sqrt{11}}{12}ma^2\omega^2$$

$$\cos\theta = \frac{\mathbf{H}_G \cdot \boldsymbol{\omega}}{H_G\omega} = \frac{12}{4\sqrt{11}} = 0.90453$$

$\theta = 25.2°$ ◀

PROBLEM 18.7

Solve Problem 18.6, assuming that the solid rectangular parallelepiped has been replaced by a hollow one consisting of six thin metal plates welded together.

PROBLEM 18.6 A solid rectangular parallelepiped of mass m has a square base of side a and a length $2a$. Knowing that it rotates at the constant rate ω about its diagonal AC' and that its rotation is observed from A as counterclockwise, determine (a) the magnitude of the angular momentum $\mathbf{H}_G$ of the parallelepiped about its mass center G, (b) the angle that $\mathbf{H}_G$ forms with the diagonal AC'.

SOLUTION

Body diagonal:

$$d = \sqrt{a^2 + (2a)^2 + a^2} = \sqrt{6}a$$

$$\boldsymbol{\omega} = \frac{\omega}{d}(-a\mathbf{i} + 2a\mathbf{j} - a\mathbf{k}) = -\frac{\omega}{\sqrt{6}}\mathbf{i} + \frac{2\omega}{\sqrt{6}}\mathbf{j} - \frac{\omega}{\sqrt{6}}\mathbf{k}$$

$$\text{Total area} = 2(a^2 + 2a^2 + 2a^2) = 10a^2$$

For each square plate:

$$m' = \frac{1}{10}m$$

$$I_x = \frac{1}{12}m'a^2 + m'a^2 = \frac{13}{12}m'a^2 = \frac{13}{120}ma^2$$

$$I_y = \frac{1}{6}m'a^2 = \frac{1}{60}ma^2$$

$$I_z = I_x = \frac{13}{120}ma^2$$

For each plate parallel to the yz plane:

$$m' = \frac{1}{5}m$$

$$I_x = \frac{1}{12}m'[a^2 + (2a)^2] = \frac{5}{12}m'a^2 = \frac{1}{12}ma^2$$

$$I_y = \frac{1}{12}m'a^2 + m'\left(\frac{a}{2}\right)^2 = \frac{1}{3}m'a^2 = \frac{1}{15}ma^2$$

$$I_z = \frac{1}{12}m(2a)^2 + m'\left(\frac{a}{2}\right)^2 = \frac{7}{12}m'a^2 = \frac{7}{60}ma^2$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

For each plate parallel to the *xy* plane: $m' = \frac{1}{5}m$

$$I_x = \frac{1}{12}m'(2a)^2 + m'\left(\frac{a}{2}\right)^2 = \frac{7}{12}m'a^2 = \frac{7}{60}ma^2$$

$$I_y = \frac{1}{12}m'a^2 + m'\left(\frac{a}{2}\right)^2 = \frac{1}{3}m'a^2 = \frac{1}{15}ma^2$$

$$I_z = \frac{1}{12}m'[a^2 + (2a)^2] = \frac{5}{12}m'a^2 = \frac{1}{12}ma^2$$

Total moments of inertia:

$$I_x = 2\left(\frac{13}{120} + \frac{1}{12} + \frac{7}{60}\right)ma^2 = \frac{37}{60}ma^2$$

$$I_y = 2\left(\frac{1}{60} + \frac{1}{15} + \frac{1}{15}\right)ma^2 = \frac{3}{10}ma^2$$

$$I_z = 2\left(\frac{13}{120} + \frac{7}{60} + \frac{1}{12}\right)ma^2 = \frac{37}{60}ma^2$$

(*a*)

$$\mathbf{H}_G = I_x\omega_x\mathbf{i} + I_y\omega_y\mathbf{j} + I_z\omega_z\mathbf{k} = \frac{ma^2\omega}{60\sqrt{6}}(-37\mathbf{i} + 36\mathbf{j} - 37\mathbf{k})$$

$$H_G = \frac{ma^2\omega}{60\sqrt{6}}\sqrt{(37)^2 + (36)^2 + (37)^2} = 0.43216\, ma^2\omega$$

$H_G = 0.432\, ma^2\omega$ ◀

(*b*)

$$\mathbf{H}_G \cdot \boldsymbol{\omega} = \frac{ma^2\omega}{(60)(6)}(-37\mathbf{i} + 36\mathbf{j} - 37\mathbf{k}) \cdot (-\mathbf{i} + 2\mathbf{j} - \mathbf{k}) = 0.40556\, ma^2\omega^2$$

$$\cos\theta = \frac{\mathbf{H}_G \cdot \boldsymbol{\omega}}{H_G\omega} = \frac{0.40556}{0.43216} = 0.93844$$

$\theta = 20.2°$ ◀

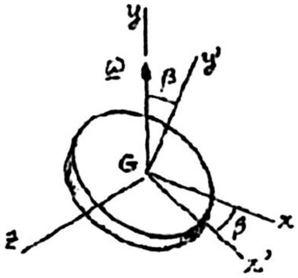
PROBLEM 18.8

A homogeneous disk of mass m and radius r is mounted on the vertical shaft AB. The normal to the disk at G forms an angle $\beta = 25°$ with the shaft. Knowing that the shaft has a constant angular velocity ω, determine the angle θ formed by the shaft AB and the angular momentum $\mathbf{H}_G$ of the disk about its mass center G.

SOLUTION

Use the principal centroidal axes Gx', y' z.



Moments of inertia:

$$\bar{I}_{x'} = \bar{I}_z = \frac{1}{4}mr^2$$

$$\bar{I}_{y'} = \frac{1}{2}mr^2$$

Angular velocities:

$$\omega_{x'} = -\omega \sin\beta$$

$$\omega_{y'} = \omega \cos\beta$$

$$\omega_z = 0$$

Using Eq. (18.10):

$$H_{x'} = \bar{I}_{x'}\omega_{x'} = -\frac{1}{4}mr^2\omega \sin\beta$$

$$H_{y'} = \bar{I}_{y'}\omega_{y'} = \frac{1}{2}mr^2\omega \cos\beta$$

$$H_z = \bar{I}_z\omega_z = 0$$

We have

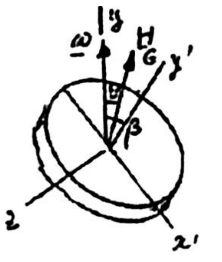
$$\mathbf{H}_G = H_{x'}\mathbf{i}' + H_{y'}\mathbf{j}' + H_z\mathbf{k}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

where $\mathbf{i}'$, $\mathbf{j}'$, $\mathbf{k}$ are the unit vectors along the x', y', z axes.

$$\mathbf{H}_G = -\frac{1}{4}mr^2\omega\sin\beta\mathbf{i}' + \frac{1}{2}mr^2\omega\cos\beta\mathbf{j}' \qquad (1)$$

$$\mathbf{H}_G = \frac{1}{4}mr^2\omega(-\sin\beta\mathbf{i}' + 2\cos\beta\mathbf{j}')$$



Forming the scalar product,

$$\mathbf{H}_G \cdot \boldsymbol{\omega} = |\mathbf{H}_G|\,\omega\cos\theta$$

$$\cos\theta = \frac{\mathbf{H}_G \cdot \boldsymbol{\omega}}{|\mathbf{H}_G|\,\omega} \qquad (2)$$

But
$$\mathbf{H}_G \cdot \boldsymbol{\omega} = \frac{1}{4}mr^2\omega(-\sin\beta\mathbf{i}' + 2\cos\beta\mathbf{j}') \cdot \omega\mathbf{j}$$

or observing that
$$\mathbf{i}' \cdot \mathbf{i} = -\sin\beta \quad \text{and} \quad \mathbf{j}' \cdot \mathbf{j} = \cos\beta$$

$$\mathbf{H}_G \cdot \boldsymbol{\omega} = \frac{1}{4}mr^2\omega^2(\sin^2\beta + 2\cos^2\beta)$$

$$= \frac{1}{4}mr^2\omega^2(1 + \cos^2\beta) \qquad (3)$$

Also,
$$|\mathbf{H}_G|\,\omega = \frac{1}{4}mr^2\omega^2\sqrt{\sin^2\beta + 4\cos^2\beta}$$

$$= \frac{1}{4}mr^2\omega^2\sqrt{1 + 3\cos^2\beta} \qquad (4)$$

Substituting from Eqs. (3) and (4) into Eq. (2),

$$\cos\theta = \frac{1 + \cos^2\beta}{\sqrt{1 + 3\cos^2\beta}}$$

For $\beta = 25°$, $\cos\theta = 0.9786$ $\theta = 11.88°$ ◀

PROBLEM 18.11

Determine the angular momentum $\mathbf{H}_O$ of the disk of Sample Problem 18.2 from the expressions obtained for its linear momentum $m\overline{\mathbf{v}}$ and its angular momentum $\mathbf{H}_G$ using Eq. (18.11). Verify that the result obtained is the same as that obtained by direct computation.

PROBLEM 18.2 A homogeneous disk of radius r and mass m is mounted on an axle OG of length L and negligible mass. The axle is pivoted at the fixed Point O, and the disk is constrained to roll on a horizontal floor. Knowing that the disk rotates counterclockwise at the rate ω_1 about the axle OG, determine (*a*) the angular velocity of the disk, (*b*) its angular momentum about O, (*c*) its kinetic energy, (*d*) the vector and couple at G equivalent to the momenta of the particles of the disk.

SOLUTION

Using Equation (18.11),

$$\mathbf{H}_O = \overline{\mathbf{r}} \times m\overline{\mathbf{v}} + \overline{\mathbf{H}}_G$$

$$= (L\mathbf{i}) \times (mr\omega_1\mathbf{k}) + \frac{1}{2}mr^2\omega_1\left(\mathbf{i} - \frac{r}{2L}\mathbf{j}\right)$$

$$= -mrL\omega_1\mathbf{j} + \frac{1}{2}mr^2\omega_1\mathbf{i} - \frac{1}{4}m\frac{r^3}{L}\omega_1\mathbf{j}$$

$$\mathbf{H}_O = \frac{1}{2}mr^2\omega_1\mathbf{i} - m\left(L^2 + \frac{1}{4}r^2\right)\left(\frac{r\omega_1}{L}\right)\mathbf{j}$$

which is the answer obtained in Part *b* of Sample Problem 18.2.

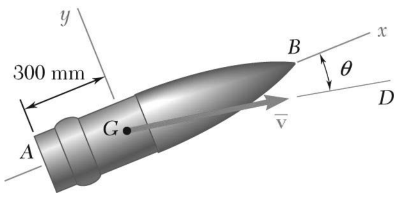
PROBLEM 18.12



The 100-kg projectile shown has a radius of gyration of 100 mm about its axis of symmetry Gx and a radius of gyration of 250 mm about the transverse axis Gy. Its angular velocity $\boldsymbol{\omega}$ can be resolved into two components; one component, directed along Gx, measures the *rate of spin* of the projectile, while the other component, directed along GD, measures its *rate of precession.* Knowing that $\theta = 6°$ and that the angular momentum of the projectile about its mass center G is $\mathbf{H}_G = (500\ \text{g}\cdot\text{m}^2/\text{s})\mathbf{i} - (10\ \text{g}\cdot\text{m}^2/\text{s})\mathbf{j}$, determine (*a*) the rate of spin, (*b*) the rate of precession.

SOLUTION

$$m = 100\ \text{kg}, \quad k_x = 100\ \text{mm} = 0.1\ \text{m}, \quad k_y = 250\ \text{mm} = 0.25\ \text{m}$$

$$\bar{I}_x = mk_x^2 = (100)(0.1)^2 = 1\ \text{kg}\cdot\text{m}^2$$

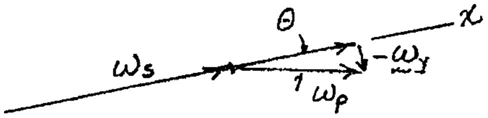
$$\bar{I}_y = \bar{I}_z = mk_y^2 = (100)(0.25)^2 = 6.25\ \text{kg}\cdot\text{m}^2$$

$$\mathbf{H}_G = (H_G)_x\mathbf{i} + (H_G)_y\mathbf{j} + (H_G)_z\mathbf{k} = \bar{I}_x\omega_x\mathbf{i} + \bar{I}_y\omega_y\mathbf{j} + \bar{I}_z\omega_z\mathbf{k}$$

$$\omega_x = \frac{(H_G)_x}{\bar{I}_x} = \frac{0.500\ \text{kg}\cdot\text{m}^2/\text{s}}{1\ \text{kg}\cdot\text{m}^2} = 0.5\ \text{rad/s}$$

$$\omega_y = \frac{(H_G)_y}{\bar{I}_y} = \frac{-0.01\ \text{kg}\cdot\text{m}^2/\text{s}}{6.25\ \text{kg}\cdot\text{m}^2} = -0.0016\ \text{rad/s}$$

$$\omega_z = 0$$



$$\omega_P \sin\theta = -\omega_y$$

$$\omega_P = \frac{-\omega_y}{\sin\theta} = \frac{0.0016}{\sin 6°} = 0.015307\ \text{rad/s}$$

(*a*) *Rate of spin.*

$$\omega_x = \omega_s + \omega_P\cos\theta$$

$$\omega_s = \omega_x - \omega_P\cos\theta$$

$$= 0.5 - 0.15307\cos 6°$$

$$= 0.4847$$

$\omega_s = 0.485\ \text{rad/s}$ ◀

(*b*) *Rate of precession.* $\omega_P = 0.01531\ \text{rad/s}$ ◀

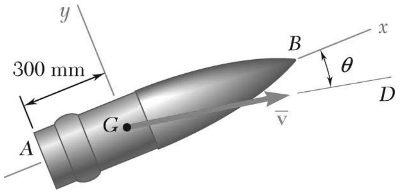
PROBLEM 18.13



Determine the angular momentum $\mathbf{H}_A$ of the projectile of Problem 18.12 about the center A of its base, knowing that its mass center G has a velocity $\overline{\mathbf{v}}$ of 750 m/s. Give your answer in terms of components respectively parallel to the x and y axes shown and to a third axis z pointing toward you.

PROBLEM 18.12 The 100-kg projectile shown has a radius of gyration of 100 mm about its axis of symmetry Gx and a radius of gyration of 250 mm about the transverse axis Gy. Its angular velocity $\boldsymbol{\omega}$ can be resolved into two components; one component, directed along Gx, measures the *rate of spin* of the projectile, while the other component, directed along GD, measures its *rate of precession.* Knowing that $\theta = 6°$ and that the angular momentum of the projectile about its mass center G is $\mathbf{H}_G = (500 \text{ g}\cdot\text{m}^2/\text{s})\mathbf{i} - (10 \text{ g}\cdot\text{m}^2/\text{s})\mathbf{j}$, determine ($a$) the rate of spin, ($b$) the rate of precession.

SOLUTION

$$m = 100 \text{ kg}, \quad \mathbf{r}_{G/A} = (0.300 \text{ m})\mathbf{i}$$

$$\overline{\mathbf{v}} = \overline{v}\cos\theta\mathbf{i} - \overline{v}\sin\theta\mathbf{j}$$

$$\mathbf{H}_G = (0.50 \text{ kg}\cdot\text{m}^2/\text{s})\mathbf{i} - (0.10 \text{ kg}\cdot\text{m}^2/\text{s})\mathbf{j}$$

$$m\overline{\mathbf{v}} = (100)(750)(\cos 6°\mathbf{i} - \sin 6°\mathbf{j})$$

$$= (74589 \text{ kg}\cdot\text{m/s})\mathbf{i} - (7839 \text{ kg}\cdot\text{m/s})\mathbf{j}$$

$$\mathbf{r}_{G/A} \times m\overline{\mathbf{v}} = 0.3\mathbf{i} \times (74589\mathbf{i} - 7839.6\mathbf{j})$$

$$= -(2351.9 \text{ kg}\cdot\text{m}^2/\text{s})\mathbf{k}$$

$$\mathbf{H}_A = \mathbf{H}_G + \mathbf{r}_{G/A} \times m\overline{\mathbf{v}}$$

$$= 0.5\mathbf{i} - 0.1\mathbf{j} + (-2351.9\mathbf{k})$$

$$\mathbf{H}_A = (0.500 \text{ kg}\cdot\text{m}^2/\text{s})\mathbf{i} - (0.100 \text{ kg}\cdot\text{m}^2/\text{s})\mathbf{j} - (2350 \text{ kg}\cdot\text{m}^2/\text{s})\mathbf{k} \blacktriangleleft$$

PROBLEM 18.14

(a) Show that the angular momentum $\mathbf{H}_B$ of a rigid body about Point B can be obtained by adding to the angular momentum $\mathbf{H}_A$ of that body about Point A the vector product of the vector $\mathbf{r}_{A/B}$ drawn from B to A and the linear momentum $m\overline{\mathbf{v}}$ of the body:

$$\mathbf{H}_B = \mathbf{H}_A + \mathbf{r}_{A/B} \times m\overline{\mathbf{v}}$$

(b) Further show that when a rigid body rotates about a fixed axis, its angular momentum is the same about any two Points A and B located on the fixed axis $(\mathbf{H}_A = \mathbf{H}_B)$ if, and only if, the mass center G of the body is located on the fixed axis.

SOLUTION

(a) Angular momenta $\mathbf{H}_A$ and $\mathbf{H}_B$ are related to $\mathbf{H}_G$ and $m\overline{\mathbf{v}}$ by

$$\mathbf{H}_A = \mathbf{r}_{G/A} \times m\overline{\mathbf{v}} + \mathbf{H}_G \quad \text{and} \quad \mathbf{H}_B = \mathbf{r}_{G/B} \times m\overline{\mathbf{v}} + \mathbf{H}_G$$

Subtracting,

$$\mathbf{H}_B - \mathbf{H}_A = \mathbf{r}_{G/B} \times m\overline{\mathbf{v}} - \mathbf{r}_{G/A} \times m\overline{\mathbf{v}}$$

$$\mathbf{H}_B = \mathbf{H}_A + (\mathbf{r}_{G/B} - \mathbf{r}_{G/A}) \times m\overline{\mathbf{v}}$$

$$= \mathbf{H}_A + (\mathbf{r}_{G/B} + \mathbf{r}_{A/G}) \times m\overline{\mathbf{v}}$$

$$\mathbf{H}_B = \mathbf{H}_A + \mathbf{r}_{A/B} \times m\overline{\mathbf{v}}$$

(b) It follows that $\mathbf{H}_A = \mathbf{H}_B$ if, and only if

$$\mathbf{r}_{A/B} \times m\overline{\mathbf{v}} = 0$$

With Points A and B located on the fixed axis,

$$\boldsymbol{\omega} = \omega\boldsymbol{\lambda}$$

where $\boldsymbol{\lambda}$ is a unit vector along the fixed axis, and

$$\overline{\mathbf{v}} = \boldsymbol{\omega} \times \mathbf{r}_{G/A} = \omega\boldsymbol{\lambda} \times \mathbf{r}_{G/A}$$

Then

$$\mathbf{r}_{A/B} \times (m\omega\boldsymbol{\lambda} \times \mathbf{r}_{G/A}) = 0$$

but $\mathbf{r}_{A/B}$ is parallel to $\boldsymbol{\lambda}$, hence,

$$\boldsymbol{\lambda} \times (\boldsymbol{\lambda} \times \mathbf{r}_{G/A}) = 0$$

Let $\mathbf{u} = \boldsymbol{\lambda} \times \mathbf{r}_{G/A}$, so that $\boldsymbol{\lambda} \times \mathbf{u} = 0$.

Note that $\mathbf{u}$ must be either perpendicular to λ or equal to zero. But if $\mathbf{u}$ is perpendicular to $\boldsymbol{\lambda}$, $\boldsymbol{\lambda} \times \mathbf{u}$ cannot be equal to zero.

Hence,

$$\mathbf{u} = \boldsymbol{\lambda} \times \mathbf{r}_{G/A} = 0$$

$\mathbf{r}_{G/A}$ is parallel to $\boldsymbol{\lambda}$ and Point G lies on the fixed axis.

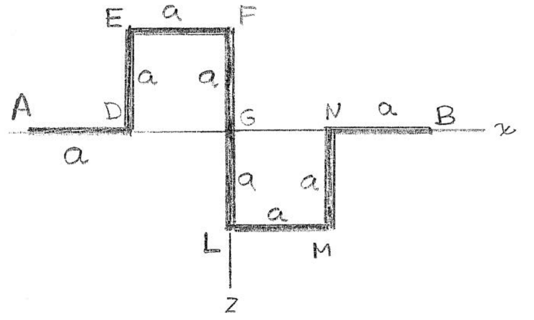
PROBLEM 18.15

A 5-kg rod of uniform cross section is used to form the shaft shown. Knowing that the shaft rotates with a constant angular velocity $\boldsymbol{\omega}$ of magnitude 12 rad/s, determine (*a*) the angular momentum $\mathbf{H}_G$ of the shaft about its mass center *G*, (*b*) the angle formed by $\mathbf{H}_G$ and the axis *AB*.

SOLUTION



$$\omega = (12 \text{ rad/s})\mathbf{i}, \qquad \omega_y = \omega_z = 0$$

$$(H_G)_x = \bar{I}_x \omega$$

$$(H_G)_y = -\bar{I}_{xy} \omega$$

$$(H_G)_z = -\bar{I}_{xz} \omega$$

The shaft is comprised of 8 sections, each of length $a = 0.25$ m and of mass $m' = \dfrac{m}{8} = 0.625$ kg.

$$\bar{I}_x = (4)\left(\frac{1}{3}m'a^2\right) + (2)(m'a^2) = \frac{10}{3}m'a^2 = \frac{10}{3}(0.625)(0.25)^2 = 0.130208 \text{ kg}\cdot\text{m}^2$$

$$\bar{I}_{xy} = 0$$

$$\bar{I}_{xz} = (4)\left(m'a\frac{a}{2}\right) = 2m'a^2 = (2)(0.625)(0.25)^2 = 0.078125 \text{ kg}\cdot\text{m}^2$$

$$(H_G)_x = (0.130208)(12) = 1.5625 \text{ kg}\cdot\text{m}^2\text{/s}$$

$$(H_G)_y = 0$$

$$(H_G)_z = -(0.078125)(12) = -0.9375 \text{ kg}\cdot\text{m}^2\text{/s}$$

(*a*) $\mathbf{H}_G = (1.563 \text{ kg}\cdot\text{m}^2\text{/s})\mathbf{i} - (0.938 \text{ kg}\cdot\text{m}^2\text{/s})\mathbf{k}$ ◀

$$H_G = \sqrt{(1.5625)^2 + (0.9375)^2} = 1.82217 \text{ kg}\cdot\text{m}^2\text{/s}$$

(*b*) $\mathbf{H}_G \cdot \boldsymbol{\omega} = (1.5625\mathbf{i} - 0.9375\mathbf{k}) \cdot 12\mathbf{i} = 18.75 \text{ kg}\cdot\text{m}^2\text{/s}^2$

$$\cos\theta = \frac{\mathbf{H}_G \cdot \boldsymbol{\omega}}{H_G \omega} = \frac{18.75}{(1.82217)(12)} = 0.85749$$

$\theta = 31.0°$ ◀

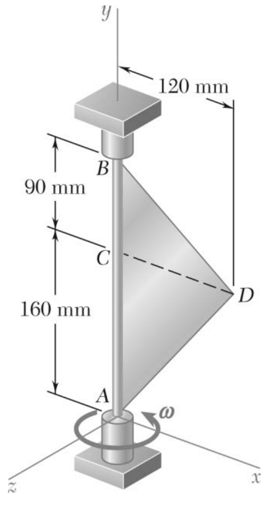
PROBLEM 18.19



The triangular plate shown has a mass of 7.5 kg and is welded to a vertical shaft *AB*. Knowing that the plate rotates at the constant rate $\omega = 12$ rad/s, determine its angular momentum about (*a*) Point *C*, (*b*) Point *A*. (*Hint*: To solve part *b* find $\overline{\mathbf{v}}$ and use the property indicated in part *a* of Problem 18.14.)

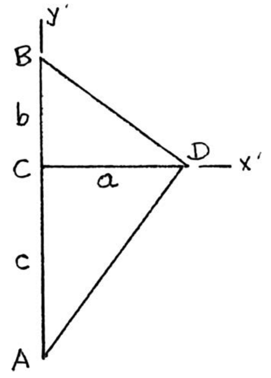
SOLUTION

$$\boldsymbol{\omega} = (12 \text{ rad/s})\mathbf{j}, \quad \omega_x = 0, \quad \omega_y = 12 \text{ rad/s}, \quad \omega_z = 0$$

(*a*) $$(H_C)_x = -I_{xy}\omega, \quad (H_C)_y = I_y\omega, \quad (H_C)_z = -I_{yz}\omega$$

Use axes with origin at *C* as shown. Divide the plate *ABD* into right triangles *ACD* and *CBD*.

For plate *ACD*, the product of inertia of the area is



$$(I_{xy})_{\text{area}} = -\frac{1}{24}a^2c^2$$

For plate *BCD*, it is

$$(I_{xy})_{\text{area}} = \frac{1}{24}a^2b^2$$

For both areas together,

$$(I_{xy})_{\text{area}} = -\frac{1}{24}(c^2 - b^2)a^2$$

Area: $$A = \frac{1}{2}(c+b)a$$

$$(I_{xy})_{\text{mass}} = \frac{m}{A}(I_{xy})_{\text{area}} = -\frac{m(c-b)a}{12}$$

For both areas together, $$(I_y)_{\text{area}} = \frac{1}{12}(c+b)a^3$$

$$(I_y)_{\text{mass}} = \frac{m}{A}(I_y)_{\text{area}} = \frac{1}{6}ma^2$$

$$(I_{xz})_{\text{mass}} \approx 0$$

PROBLEM 18.20

The triangular plate shown has a mass of 7.5 kg and is welded to a vertical shaft *AB*. Knowing that the plate rotates at the constant rate $\omega = 12$ rad/s, determine its angular momentum about (*a*) Point *C*, (*b*) Point *B*. (See hint of Problem 18.19.)

SOLUTION

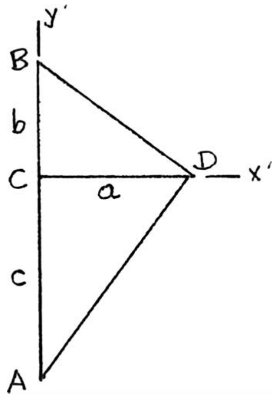
$$\boldsymbol{\omega} = (12 \text{ rad/s})\mathbf{j}, \quad \omega_x = 0, \quad \omega_y = 12 \text{ rad/s}, \quad \omega_z = 0$$

(*a*) $$(H_C)_x = -I_{xy}\omega, \quad (H_C)_y = I_y\omega, \qquad (H_C)_z = -I_{yz}\omega$$

Use axes with origin at *C* as shown. Divide the plate *ABD* into right triangles *ACD* and *CBD*.

For plate *ACD*, the product of inertia of the area is

$$(I_{xy})_{\text{area}} = -\frac{1}{24}a^2c^2$$



For plate *BCD*, it is

$$(I_{xy})_{\text{area}} = \frac{1}{24}a^2b^2$$

For both areas together,

$$(I_{xy})_{\text{area}} = -\frac{1}{24}(c^2 - b^2)a^2$$

Area: $$A = \frac{1}{2}(c+b)a$$

$$(I_{xy})_{\text{mass}} = \frac{m}{A}(I_{xy})_{\text{area}} = -\frac{m(c-b)a}{12}$$

For both areas together,

$$(I_y)_{\text{area}} = \frac{1}{12}(c+b)a^3$$

$$(I_y)_{\text{mass}} = \frac{m}{A}(I_y)_{\text{area}} = \frac{1}{6}ma^2$$

$$(I_{xz})_{\text{mass}} \approx 0$$

Data: $m = 7.5\text{ kg}\quad a = 120\text{ mm} = 0.12\text{ m}$

$$b = 90\text{ mm} = 0.09\text{ m}\quad c = 160\text{ mm} = 0.16\text{ m}$$

$$(I_{xy})_{\text{mass}} = -\frac{(7.5)(0.07)(0.12)}{12} = -0.00525\text{ kg}\cdot\text{m}^2$$

$$(I_y)_{\text{mass}} = \frac{(7.5)(0.12)^2}{6} = 0.018\text{ kg}\cdot\text{m}^2$$

$$(H_C)_x = -(-0.00525)(12) = 0.063\text{ kg}\cdot\text{m}^2\text{/s}$$

$$(H_C)_y = (0.018)(12) = 0.216\text{ kg}\cdot\text{m}^2\text{/s}$$

$$(H_C)_z = 0$$

$$\mathbf{H}_C = (0.063\text{ kg}\cdot\text{m}^2\text{/s})\mathbf{i} + (0.216\text{ kg}\cdot\text{m}^2\text{/s})\mathbf{j} \blacktriangleleft$$

Locate the mass center. $\mathbf{r}_{G/C} = \frac{a}{3}\mathbf{i} + \bar{y}\mathbf{j}$

Velocity of mass center: $\bar{\mathbf{v}} = \omega \times \mathbf{r}_{G/C}$

$$\bar{\mathbf{v}} = \omega\mathbf{j} \times \left(\frac{a}{3}\mathbf{i} + \bar{y}\mathbf{j}\right) = -\frac{1}{3}\omega a\mathbf{k} = -\left(\frac{1}{3}\right)(12)(0.12)\mathbf{k} = -(0.48\text{ m/s})\mathbf{k}$$

$$\mathbf{r}_{C/B} = -b\mathbf{j} = -(0.09\text{ m})\mathbf{j}$$

$$\mathbf{r}_{C/B} \times m\bar{\mathbf{v}} = (-0.09\mathbf{j}) \times [(7.5)(-0.48\mathbf{k})] = (0.324\text{ kg}\cdot\text{m}^2\text{/s})\mathbf{i}$$

(*b*) $$\mathbf{H}_B = \mathbf{H}_C + \mathbf{r}_{C/B} \times m\bar{\mathbf{v}} = (0.063 + 0.324)\mathbf{i} + 0.216\mathbf{j}$$

$$\mathbf{H}_B = (0.387\text{ kg}\cdot\text{m}^2\text{/s})\mathbf{i} + (0.216\text{ kg}\cdot\text{m}^2\text{/s})\mathbf{j} \blacktriangleleft$$

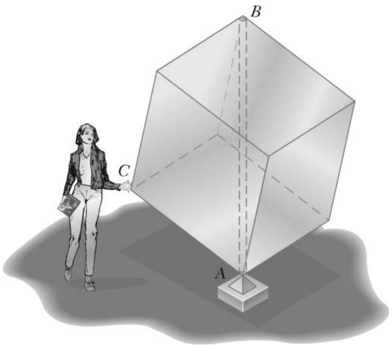
PROBLEM 18.21



One of the sculptures displayed on a university campus consists of a hollow cube made of six aluminum sheets, each 1.5×1.5 m, welded together and reinforced with internal braces of negligible weight. The cube is mounted on a fixed base at A and can rotate freely about its vertical diagonal AB. As she passes by this display on the way to a class in mechanics, an engineering student grabs corner C of the cube and pushes it for 1.2 s in a direction perpendicular to the plane ABC with an average force of 50 N. Having observed that it takes 5 s for the cube to complete one full revolution, she flips out her calculator and proceeds to determine the mass of the cube. What is the result of her calculation? (*Hint:* The perpendicular distance from the diagonal joining two vertices of a cube to any of its other six vertices can be obtained by multiplying the side of the cube by $\sqrt{2/3}$.)

SOLUTION

Let $m' = \frac{1}{6}m$ be the mass of one side of the cube. Choose x, y, and z axes perpendicular to the face of the cube. Let a be the side of the cube.

For a side perpendicular to the x axis, $(I_x)_1 = \frac{1}{6}m'a^2$.

For a side perpendicular to the y or z axis, $$(I_x)_2 = \left(\frac{1}{12} + \frac{1}{4}\right)m'a^2 = \frac{1}{3}m'a^2$$

Total moment of inertia: $$I_x = 2(I_x)_1 + 4(I_x)_2 = \frac{5}{3}m'a^2 = \frac{5}{18}ma^2$$

By symmetry, $I_y = I_x$ and $I_z = I_x$.

Since all three moments of inertia are equal, the ellipsoid of inertia is a sphere. All centroidal axes are principal axes.

Moment of inertia about the vertical axis: $$I_v = \frac{5}{18}ma^2$$

Let $b = \sqrt{\frac{2}{3}}a$ be the moment arm of the impulse applied to the corner.

Using the impulse-momentum principle and taking moments about the vertical axis,

$$bF(\Delta t) = H_v = I_v\omega = \frac{5}{18}ma^2\omega \qquad (1)$$

Data: $$a = 1.5 \text{ m}, \qquad b = \sqrt{\frac{2}{3}}(1.5) = 1.22474 \text{ m}$$

$$\omega = \frac{2\pi}{5} = 1.25664 \text{ rad/s}, \qquad F = 50 \text{ N}, \qquad \Delta t = 1.2 \text{ s}.$$

Solving Equation (1) for m, $$m = \frac{18}{5}\frac{bF(\Delta t)}{a^2\omega} = \frac{18}{5}\frac{(1.22474)(50)(1.2)}{(1.5)^2(1.25664)} = 93.563 \text{ kg}$$

$m = 93.6$ kg ◀

PROBLEM 18.22

If the aluminum cube of Problem 18.21 were replaced by a cube of the same size, made of six plywood sheets with mass 8 kg each, how long would it take for that cube to complete one full revolution if the student pushed its corner C in the same way that she pushed the corner of the aluminum cube?

SOLUTION

Let $m' = \frac{1}{6}m$ be the mass of one side of the cube. Choose x, y, and z axes perpendicular to the face of the cube. Let a be the side of the cube.

For a side perpendicular to the x axis, $(I_x)_1 = \frac{1}{6}m'a^2$.

For a side perpendicular to the y or z axis, $$(I_x)_2 = \left(\frac{1}{12} + \frac{1}{4}\right)m'a^2 = \frac{1}{3}m'a^2$$

Total moment of inertia: $$I_x = 2(I_x)_1 + 4(I_x)_2 = \frac{5}{3}m'a^2 = \frac{5}{18}ma^2$$

By symmetry, $I_y = I_x$ and $I_z = I_x$.

Since all three moments of inertia are equal, the ellipsoid of inertia is a sphere. All centroidal axes are principal axes.

Moment of inertia about the vertical axis: $$I_v = \frac{5}{18}ma^2$$

Let $b = \sqrt{\frac{2}{3}}a$ be the moment arm of the impulse applied to the corner.

Using the impulse-momentum principle and taking moments about the vertical axis,

$$bF(\Delta t) = H_v = I_v\omega = \frac{5}{18}ma^2\omega \qquad (1)$$

Data: $$m' = 8 \text{ kg}, \qquad m = 6m' = 48 \text{ kg}, \qquad a = 1.5 \text{ m},$$

$$b = \sqrt{\frac{2}{3}}a = 1.22474 \text{ m}, \qquad F = 50 \text{ N}, \qquad \Delta t = 1.2 \text{ s}$$

Solving (1) for ω,

$$\omega = \frac{18}{5}\frac{bF(\Delta t)}{ma^2} = \frac{18}{5}\frac{(1.22474)(50)(1.2)}{(48)(1.5)^2} = 2.4495 \text{ rad/s}$$

$$t = \frac{2\pi}{\omega} = \frac{2\pi}{2.4495}$$

$t = 2.57$ s ◀

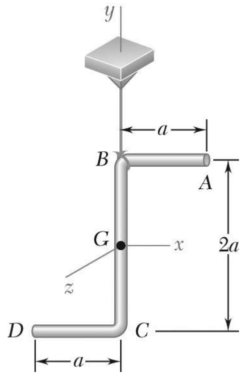
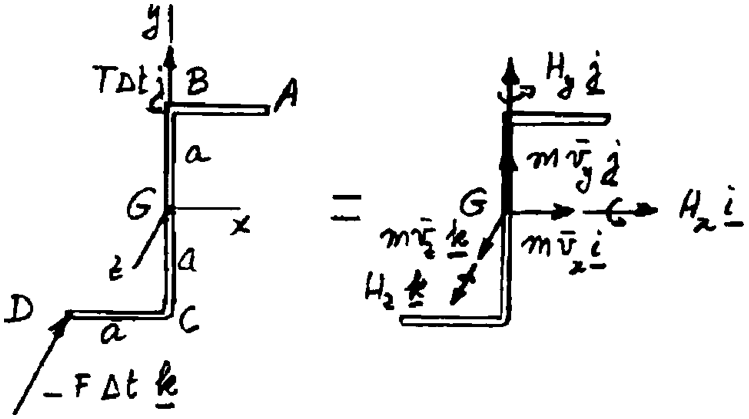
PROBLEM 18.23



A uniform rod of total mass m is bent into the shape shown and is suspended by a wire attached at B. The bent rod is hit at D in a direction perpendicular to the plane containing the rod (in the negative z direction). Denoting the corresponding impulse by $\mathbf{F}\Delta t$, determine (a) the velocity of the mass center of the rod, (b) the angular velocity of the rod.

SOLUTION

We apply the principle of impulse and momentum, considering only the impulsive forces.



(a) *Velocity of mass center*

From constraints: $\bar{v}_y = 0$

$\xrightarrow{+}$ x components: $0 = m\bar{v}_x$ $\qquad \bar{v}_x = 0$

$+\uparrow$ y components: $T\Delta t = m\bar{v}_y = 0$ $\qquad T\Delta t = 0$

$+\swarrow$ z components: $-F\Delta t = m\bar{v}_t$ $\qquad \bar{v}_z = -\dfrac{F\Delta t}{m}$

$$\bar{\mathbf{v}} = -\frac{F\Delta t}{m}\mathbf{k} \blacktriangleleft$$

(b) *Angular velocity*

Equating moments about G:

$$(-a\mathbf{i} - a\,\mathbf{j}) \times (-F\Delta t\,\mathbf{k}) = H_x\mathbf{i} + H_y\mathbf{j} + H_z\mathbf{k}$$

$$aF\Delta t\,\mathbf{i} - aF\Delta t\,\mathbf{j} = H_x\mathbf{i} + H_y\mathbf{j} + H_z\mathbf{k}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

Thus: $$H_x = aF\Delta t, \quad H_y = -aF\Delta t, \quad H_z = 0 \tag{1}$$

To determine angular velocity, we shall use Eqs. (18.7).

First, we determine the moments & products of inertia:

$$\bar{I}_x = \frac{1}{12}\left(\frac{m}{2}\right)(2a)^2 + \frac{m}{4}a^2 + \frac{m}{4}a^2 = \frac{2}{3}ma^2 \tag{2}$$

$$\bar{I}_y = 2\left[\frac{1}{3}\left(\frac{m}{4}\right)a^2\right] = \frac{1}{6}ma^2 \tag{3}$$

$$\bar{I}_{xy} = \frac{m}{4}\left(\frac{a}{2}\right)(a) + \frac{m}{4}\left(-\frac{a}{2}\right)(-a) = +\frac{1}{4}ma^2 \tag{4}$$

$$\bar{I}_{xz} = 0 \qquad \bar{I}_{yz} = 0 \tag{5}$$

We substitute the expressions (1) through (5) into Eqs. (18.7):

$$aF\Delta t = \frac{2}{3}ma^2\omega_x - \frac{1}{4}ma^2\omega_y + 0 \tag{6}$$

$$-aF\Delta t = -\frac{1}{4}ma^2\omega_x + \frac{1}{6}ma^2\omega_y + 0 \tag{7}$$

$$0 = 0 + 0 + \bar{I}_z\omega_z \tag{8}$$

Multiplying Eq. (7) by 3/2 and adding to Eq. (6):

$$-\frac{1}{2}aF\Delta t = \frac{7}{24}ma^2\omega_x \qquad \omega_x = -\frac{12}{7}\frac{F\Delta t}{ma}$$

Substituting for ω into (7):

$$-aF\Delta t + \frac{1}{4}\left(-\frac{12^2}{7}\right)aF\Delta t = \frac{1}{6}ma^2\omega_y, \quad \omega_y = -\frac{60}{7}\frac{F\Delta t}{ma}$$

From Eq. (8): $\bar{I}_z\omega_z = 0 \quad \omega_z = 0$

Thus: $$\boldsymbol{\omega} = \frac{12}{7}\frac{F\Delta t}{ma}(-\mathbf{i} - 5\mathbf{j}) \blacktriangleleft$$

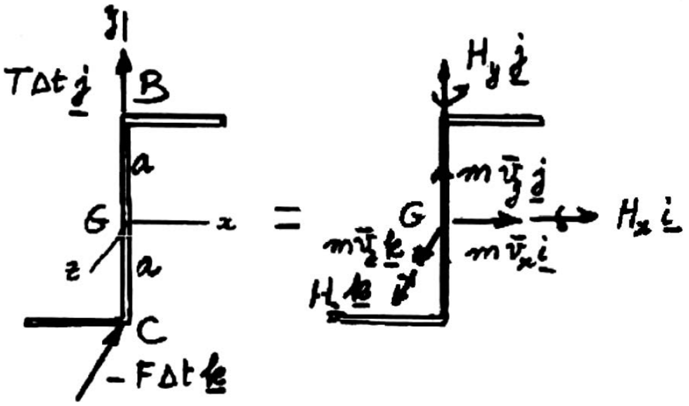
PROBLEM 18.24

Solve Problem 18.23, assuming that the bent rod is hit at *C*.

PROBLEM 18.23 A uniform rod of total mass *m* is bent into the shape shown and is suspended by a wire attached at *B*. The bent rod is hit at *D* in a direction perpendicular to the plane containing the rod (in the negative *z* direction). Denoting the corresponding impulse by $\mathbf{F}\Delta t$, determine (*a*) the velocity of the mass center of the rod, (*b*) the angular velocity of the rod.

SOLUTION

We apply the principle of impulse and momentum, consider only impulsive forces.



(*a*) *Velocity of mass center*

From constraints: $\bar{v}_y = 0$

$\xrightarrow{+}$ *x* components: $0 = m\bar{v}_x \qquad \bar{v}_x = 0$

$+\uparrow$ *y* components: $T\Delta t = m\bar{v}_y = 0 \qquad T\Delta t = 0$

$+\swarrow$ *z* components: $-F\Delta t = m\bar{v}_z \qquad \bar{v}_z = -\dfrac{F\Delta t}{m}$

$$\bar{\mathbf{v}} = \frac{F\Delta t}{m}\mathbf{k} \blacktriangleleft$$

(*b*) *Angular velocity*

Equating moments about *G*:

$$-a\,\mathbf{j}\times(-F\Delta t\,\mathbf{k}) = H_x\mathbf{i} + H_y\mathbf{j} + H_z\mathbf{k}$$

$$aF\Delta t\,\mathbf{i} = H_x\mathbf{i} + H_y\mathbf{j} + H_z\mathbf{k}$$

Thus: $H_x = aF\Delta t, \quad H_y = 0, \quad H_z = 0 \qquad (1)$

All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 18.24 (Continued)

To determine angular velocity, we shall use Eqs. (18.7) first, we determine the moments & products of inertia:

$$\bar{I}_x = \frac{1}{12}\left(\frac{m}{2}\right)(2a)^2 + \frac{m}{4}a^2 + \frac{m}{4}a^2 = \frac{2}{3}ma^2 \tag{2}$$

$$\bar{I}_y = 2\left[\frac{1}{3}\left(\frac{m}{4}\right)a^2\right] = \frac{1}{6}ma^2 \tag{3}$$

$$\bar{I}_{xy} = \frac{m}{4}\left(\frac{a}{2}\right)(a) + \frac{m}{4}\left(-\frac{a}{2}\right)(-a) = +\frac{1}{4}ma^2 \tag{4}$$

$$\bar{I}_{xz} = 0 \qquad \bar{I}_{yz} = 0 \tag{5}$$

$$aF\Delta t = \frac{2}{3}ma^2\omega_x - \frac{1}{4}ma^2\omega_y + 0 \tag{6}$$

$$0 = -\frac{1}{4}ma^2\omega_x + \frac{1}{6}ma^2\omega_y + 0 \tag{7}$$

$$0 = 0 + 0 + \bar{I}_z\omega_z \tag{8}$$

Multiplying Eq. (7) by 3/2 and adding to Eq. (6):

$$aF\Delta t = \left(\frac{2}{3} - \frac{3}{8}\right)ma^2\omega_{x,} \qquad \omega_x = \frac{24}{7}\frac{F\Delta t}{ma}$$

Substituting for ω_x into (7):

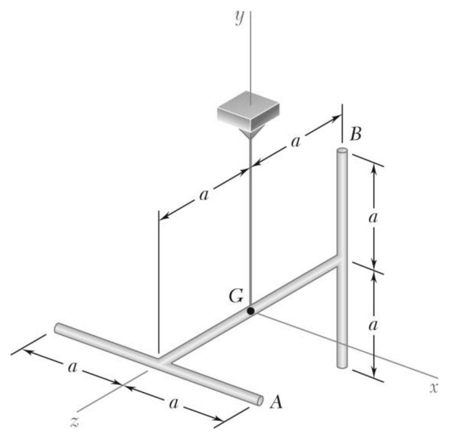
$$\omega_y = \frac{3}{2}\omega_x = \frac{3}{2}\frac{24}{7}aF\Delta t, \quad \omega_y = \frac{36}{7}\frac{F\Delta t}{ma}$$

From Eq. (8): $\bar{I}_z\omega_z = 0, \quad \omega_z = 0$

Thus: $$\boldsymbol{\omega} = \frac{12}{7}\frac{F\Delta t}{ma}(2\mathbf{i} + 3\mathbf{j}) \blacktriangleleft$$

Note that $\omega_y \neq 0$, even though Point C where impulse is applied is on the y axis.

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



PROBLEM 18.25

Three slender rods, each of mass m and length $2a$, are welded together to form the assembly shown. The assembly is hit at A in a vertical downward direction. Denoting the corresponding impulse by $\mathbf{F}\,\Delta t$, determine immediately after the impact (a) the velocity of the mass center G, (b) the angular velocity of the rod.

SOLUTION

Computation of moments and products of inertia.

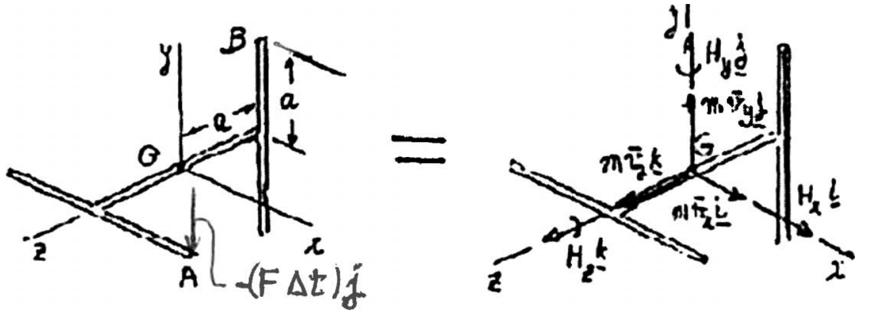
$$\bar{I}_x = (I_x)_1 + (I_x)_2 + (I_x)_3 = ma^2 + \frac{1}{3}ma^2 + m\left(a^2 + \frac{a^2}{3}\right) = \frac{8}{3}ma^2$$

$$\bar{I}_y = (I_y)_1 + (I_y)_2 + (I_y)_3 = m\left(a^2 + \frac{a^2}{3}\right) + \frac{1}{3}ma^2 + ma^2 = \frac{8}{3}ma^2 \qquad (1)$$

$$\bar{I}_z = (I_z)_1 + (I_z)_2 + (I_z)_3 = \frac{1}{3}ma^2 + 0 + \frac{1}{3}ma^2 = \frac{2}{3}ma^2$$

$$\bar{I}_{xy} = 0, \quad \bar{I}_{yz} = 0, \quad I_{zx} = 0$$

Impulse-momentum principle.



The impulses consist of $-(F\Delta t)\mathbf{j}$ applied at A and $(T\Delta t)\mathbf{j}$ applied at G. Because of constraints, $\bar{v}_y = 0$.

(a) Velocity of mass center.

Equate sums of vectors: $(T\Delta t)\mathbf{j} - (F\Delta t)\mathbf{j} = m\bar{v}_x\mathbf{i} + m\bar{v}_z\mathbf{k}$

Thus, $T\Delta t = F\Delta t, \quad v_x = 0, \quad v_z = 0.$ Since $v_y = 0$ from above, $\bar{\mathbf{v}} = 0$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

(*b*) Angular velocity.

Equate moments about G:

$$(a\mathbf{i} + a\mathbf{k}) \times (-F\Delta t)\mathbf{j} = H_x\mathbf{i} + H_y\mathbf{j} + H_z\mathbf{k}$$

$$-(aF\Delta t)\mathbf{k} + (aF\Delta t)\mathbf{i} = H_x\mathbf{i} + H_y\mathbf{j} + H_z\mathbf{k}$$

Thus, $$H_x = aF\Delta t, \quad H_y = 0, \quad H_z = -aF\Delta t \tag{2}$$

Since the three products of inertia are zero, the x, y, and z axes are principal centroidal axes and we can use Eqs. (18.10). Substituting from Eqs. (1) and (2) into these equations, we have

$$H_x = \bar{I}_x\omega_x: \quad aF\Delta t = \frac{8}{3}ma^2\omega_x \quad \omega_x = 3F\Delta t/8ma \tag{3}$$

$$H_y = \bar{I}_y\omega_y: \quad 0 = \frac{8}{3}ma^2\omega_y \quad \omega_y = 0 \tag{4}$$

$$H_z = \bar{I}_z\omega_z: \quad -aF\Delta t = \frac{2}{3}ma^2 \quad \omega_z = -3F\Delta t/2ma \tag{5}$$

Therefore,

$$\boldsymbol{\omega} = (3F\Delta t/8ma)(\mathbf{i} - 4\mathbf{k})$$ ◀

PROBLEM 18.26

Solve Problem 18.25, assuming that the assembly is hit at B in a direction opposite to that of the x axis.

PROBLEM 18.25 Three slender rods, each of mass m and length $2a$, are welded together to form the assembly shown. The assembly is hit at A in a vertical downward direction. Denoting the corresponding impulse by $\mathbf{F}\Delta t$, determine immediately after the impact (*a*) the velocity of the mass center G, (*b*) the angular velocity of the rod.

SOLUTION

Computation of moments and products of inertia.

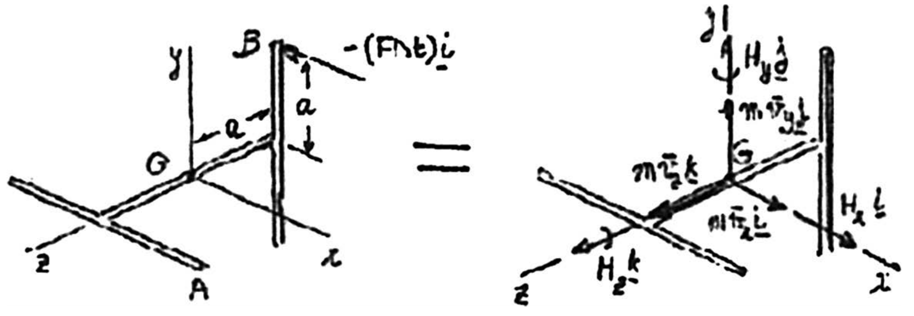
$$\bar{I}_x = (I_x)_1 + (I_x)_2 + (I_x)_3 = ma^2 + \frac{1}{3}ma^2 + m\left(a^2 + \frac{a^2}{3}\right) = \frac{8}{3}ma^2$$

$$\bar{I}_y = (I_y)_1 + (I_y)_2 + (I_y)_3 = m\left(a^2 + \frac{a^2}{3}\right) + \frac{1}{3}ma^2 + ma^2 = \frac{8}{3}ma^2 \qquad (1)$$

$$\bar{I}_z = (I_z)_1 + (I_z)_2 + (I_z)_3 = \frac{1}{3}ma^2 + 0 + \frac{1}{3}ma^2 = \frac{2}{3}ma^2$$

$$\bar{I}_{xy} = \bar{I}_{yz} = \bar{I}_{zx} = 0$$

Impulse-momentum principle.



The only impulse is $F\Delta t = -(F\Delta t)\mathbf{i}$.

(*a*) Velocity of mass center.

Equate sums of vectors: $\quad -(F\Delta t)\mathbf{i} = m\bar{v}_x\mathbf{i} + mv_y\mathbf{j} + mv_z\mathbf{k}$

Thus, $\quad v_x = -F\Delta t/m, \quad v_y = 0, \quad v_z = 0$

$\bar{\mathbf{v}} = -(F\Delta t/m)\mathbf{i}$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

(*b*) Angular velocity.

Equate moments about G:

$$(a\mathbf{j} - a\mathbf{k}) \times (-F\Delta t)\mathbf{i} = H_x\mathbf{i} + H_y\mathbf{j} + H_z\mathbf{k}$$

$$(aF\Delta t)\mathbf{k} + (aF\Delta t)\mathbf{j} = H_x\mathbf{i} + H_y\mathbf{j} + H_z\mathbf{k}$$

Thus, $$H_x = 0, \quad H_y = aF\Delta t, \quad H_z = aF\Delta t \qquad (2)$$

Since the three products of inertia are zero, the x, y, and z axes are principal centroidal axes and we can use Eqs. (18.10). Substituting from Eqs. (1) and (2) into these equations, we have

$$H_x = \bar{I}_x\omega_x: \qquad 0 = \frac{8}{3}ma^2\omega_x \quad \omega_x = 0 \qquad (3)$$

$$H_y = \bar{I}_y\omega_y: \qquad aF\Delta t = \frac{8}{3}ma^2\omega_y \quad \omega_y = 3F\Delta t/8ma \qquad (4)$$

$$H_z = \bar{I}_z\omega_z: \qquad aF\Delta t = \frac{2}{3}ma^2\omega_z \quad \omega_z = 3F\Delta t/2ma \qquad (5)$$

Therefore,

$$\boldsymbol{\omega} = (3F\Delta t/8ma)(\mathbf{j} + 4\mathbf{k}) \blacktriangleleft$$

PROBLEM 18.27

Two circular plates, each of mass 4 kg, are rigidly connected by a rod *AB* of negligible mass and are suspended from Point *A* as shown. Knowing that an impulse $\mathbf{F}\,\Delta t = -(2.4\ \mathrm{N\cdot s})\mathbf{k}$ is applied at Point *D*, determine (*a*) the velocity of the mass center *G* of the assembly, (*b*) the angular velocity of the assembly.

SOLUTION

Moments and products of inertia:

$$I_x = 2\left(\frac{1}{4}mr^2 + mb^2\right) = 2\left[\frac{1}{4}(4)(0.18)^2 + (4)(0.15)^2\right] = 0.2448\ \mathrm{kg\cdot m^2}$$

$$I_y = 2\left(\frac{1}{2}mr^2 + mr^2\right) = 3mr^2 = (3)(4)(0.18)^2 = 0.3888\ \mathrm{kg\cdot m^2}$$

$$I_z = 2\left[\frac{1}{4}mr^2 + m(b^2 + r^2)\right]$$

$$= 2\left[\frac{1}{4}(4)(0.18)^2 + (4)(0.15^2 + 0.18^2)\right] = 0.504\ \mathrm{kg\cdot m^2}$$

$$I_{xy} = mb(-r) + m(-b)(r) = -2mbr = -(2)(4)(0.15)(0.18) = -0.216\ \mathrm{kg\cdot m^2}$$

$$I_{xz} = 0, \quad I_{yz} = 0, \qquad \text{total mass} = 2m$$

Constraint of cable: $(v_G)_y = 0 \quad \overline{\mathbf{v}} = \mathbf{v}_G$

Principle of impulse-momentum: $2m\overline{\mathbf{v}} = 0, \quad \mathbf{H}_G = 0$ initially.

PROBLEM 18.27 (Continued)

(*a*) Direct components:

$$\mathbf{F}\Delta t = 2m\overline{\mathbf{v}}$$

$$0 = 2m\overline{v}_x \qquad \overline{v}_x = 0$$

$$T\Delta t = 2m\overline{v}_y = 0$$

$$-F\Delta t = 2m\overline{v}_z$$

$$\overline{v}_z = -\frac{F\Delta t}{2m} = -\frac{2.4}{(2)(4)} = -0.3 \text{ m/s} \qquad \overline{\mathbf{v}} = -(0.300 \text{ m/s})\mathbf{k} \blacktriangleleft$$

(*b*) <u>Moments about *G*.</u> $(b\mathbf{j} - r\mathbf{i}) \times (-F\Delta t\mathbf{k}) = \mathbf{H}_G$

$$-bF(\Delta t)\mathbf{i} - rF\Delta t\mathbf{j} = (I_x\omega_x - I_{xy}\omega_y)\mathbf{i} + (-I_{xy}\omega_x + I_y\omega_y)\mathbf{j} + I_z\omega_z\mathbf{k}$$

Resolve into components and apply the numerical data.

$$\mathbf{i}: \quad -(0.15)(2.4) = 0.2448\omega_x - (-0.216)\omega_y \qquad (1)$$

$$\mathbf{j}: \quad -(0.18)(2.4) = -(-0.216)\omega_x + 0.3888\omega_y \qquad (2)$$

$$\mathbf{k}: \quad 0 = 0.504\omega_z \qquad \omega_z = 0$$

Solving Eqs. (1) and (2), $\omega_x = -0.962$ rad/s, $\omega_y = -0.577$ rad/s

$$\boldsymbol{\omega} = -(0.962 \text{ rad/s})\mathbf{i} - (0.577 \text{ rad/s})\mathbf{j} \blacktriangleleft$$

PROBLEM 18.28

Two circular plates, each of mass 4 kg, are rigidly connected by a rod *AB* of negligible mass and are suspended from Point *A* as shown. Knowing that an impulse $\mathbf{F}\Delta t = (2.4\ \text{N}\cdot\text{s})\mathbf{j}$ is applied at Point *D*, determine (*a*) the velocity of the mass center *G* of the assembly, (*b*) the angular velocity of the assembly.

SOLUTION

Moments and products of inertia:

$$I_x = 2\left(\frac{1}{4}mr^2 + mb^2\right) = 2\left[\frac{1}{4}(4)(0.18)^2 + (4)(0.15)^2\right] = 0.2448\ \text{kg}\cdot\text{m}^2$$

$$I_y = 2\left(\frac{1}{2}mr^2 + mr^2\right) = 3mr^2 = (3)(4)(0.18)^2 = 0.3888\ \text{kg}\cdot\text{m}^2$$

$$I_z = 2\left[\frac{1}{4}mr^2 + m(b^2 + r^2)\right]$$

$$= 2\left[\frac{1}{4}(4)(0.18)^2 + (4)(0.15^2 + 0.18^2)\right] = 0.504\ \text{kg}\cdot\text{m}^2$$

$$I_{xy} = mb(-r) + m(-b)(r) = -2mbr = -(2)(4)(0.15)(0.18) = -0.216\ \text{kg}\cdot\text{m}^2$$

$$I_{xz} = 0, \quad I_{yz} = 0, \qquad \text{total mass} = 2m$$

Constraint of cable: $(v_G)_y = 0 \quad \bar{\mathbf{v}} = \mathbf{v}_G$

Principle of impulse-momentum: $2m\bar{\mathbf{v}} = 0, \quad \mathbf{H}_G = 0$ initially.

If you are a student using this Manual, you are using it without permission.*

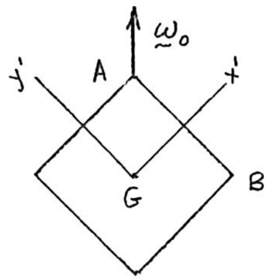
PROBLEM 18.31

A square plate of side a and mass m supported by a ball-and-socket joint at A is rotating about the y axis with a constant angular velocity $\boldsymbol{\omega} = \omega_0\mathbf{j}$ when an obstruction is suddenly introduced at B in the xy plane. Assuming the impact at B to be perfectly plastic $(e = 0)$, determine immediately after impact (a) the angular velocity of the plate, (b) the velocity of its mass center G.

SOLUTION

For the x' and y' axes shown, the initial angular velocity $\omega_0\mathbf{j}$ has components



$$\omega_{x'} = \frac{\sqrt{2}}{2}\omega_0, \qquad \omega_{y'} = \frac{\sqrt{2}}{2}\omega_0,$$

Initial angular momentum about the mass center:

$$(\mathbf{H}_G)_0 = \bar{I}_{x'}\omega_{x'}\mathbf{i}' + \bar{I}_{y'}\omega_{y'}\mathbf{j}' = \frac{1}{12}ma^2\frac{\sqrt{2}}{2}\omega_0(\mathbf{i}' + \mathbf{j}')$$

Initial velocity of the mass center: $\bar{\mathbf{v}}_0 = 0$

Let $\boldsymbol{\omega}$ be the angular velocity and $\bar{\mathbf{v}}$ be the velocity of the mass center immediately after impact.
Let $(F\Delta t)\mathbf{k}$ be the impulse at B.

Kinematics:

$$\mathbf{v}_B = \boldsymbol{\omega}\times\mathbf{r}_{B/A} = (\omega_{x'}\mathbf{i}' + \omega_{y'}\mathbf{j}' + \omega_{z'}\mathbf{k}')\times(-a\mathbf{j}')$$

$$\mathbf{v}_B = a(\omega_{z'}\mathbf{i}' + \omega_{x'}\mathbf{k}')$$

Since the corner B does not rebound, $(v_B)_{z'} = 0$ or $\omega_{x'} = 0$

$$\bar{\mathbf{v}} = \boldsymbol{\omega}\times\mathbf{r}_{G/A} = (\omega_{y'}\mathbf{j}' + \omega_{z'}\mathbf{k}')\times\left(\frac{1}{2}a\right)(-\mathbf{i}' - \mathbf{j}')$$

$$= \frac{1}{2}a(\omega_{z'}\mathbf{i}' - \omega_{z'}\mathbf{j} + \omega_{y}\mathbf{k}')$$

Also,

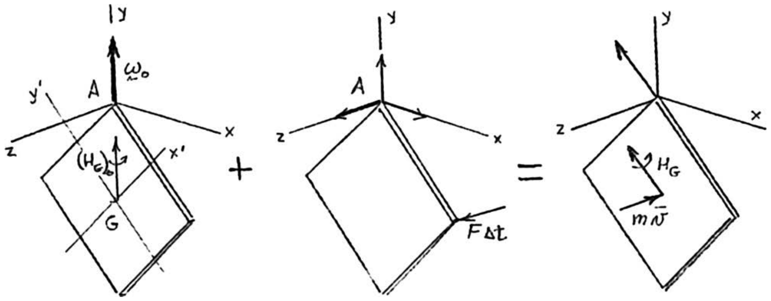
$$\mathbf{r}_{G/A}\times m\bar{\mathbf{v}} = \frac{1}{4}ma^2(-\omega_{y'}\mathbf{i}' + \omega_{y'}\mathbf{j}' + 2\omega_{z'}\mathbf{k}')$$

and

$$\mathbf{H}_G = I_{x'}\omega_{x'}\mathbf{i}' + I_{y'}\omega_{y'}\mathbf{j}' + \bar{I}_{z'}\omega_{z'}\mathbf{k}' = \frac{1}{12}ma^2\omega_{y'}\mathbf{j}' + \frac{1}{6}ma^2\omega_{z'}\mathbf{k}'$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

Principle of impulse-momentum.



Moments about A:
$$(\mathbf{H}_A)_0 + (-a\mathbf{j}) \times (F\Delta t)\mathbf{k} = \mathbf{H}_A$$

$$(\mathbf{H}_G)_0 + \mathbf{r}_{G/A} \times m\bar{\mathbf{v}}_0 - (aF\Delta t)\mathbf{i} = \mathbf{H}_G + \mathbf{r}_{G/A} \times m\bar{\mathbf{v}}$$

Resolve into components.

$$\mathbf{i}': \quad \frac{1}{24}\sqrt{2}ma^2\omega_0 - aF(\Delta t) = -\frac{1}{4}ma^2\omega_{y'}$$

$$\mathbf{j}': \quad \frac{1}{24}\sqrt{2}ma^2\omega_0 = \frac{1}{12}ma^2\omega_{y'} + \frac{1}{4}ma^2\omega_{y'} \quad \omega_{y'} = \frac{\sqrt{2}}{8}\omega_0$$

$$\mathbf{k}': \quad 0 = \frac{1}{6}ma^2\omega_{z'} + \frac{1}{2}ma^2\omega_{z'} \quad \omega_{z'} = 0$$

(*a*)
$$\boldsymbol{\omega} = \frac{\sqrt{2}}{8}\omega_0\mathbf{j}' = \frac{1}{8}\sqrt{2}\omega_0\frac{\sqrt{2}}{2}(\mathbf{j} - \mathbf{i})$$
$$\boldsymbol{\omega} = \frac{1}{8}\omega_0(-\mathbf{i} + \mathbf{j}) \blacktriangleleft$$

(*b*)
$$\bar{\mathbf{v}} = \frac{1}{2}a\omega_y\mathbf{k}' = \frac{\sqrt{2}}{16}a\omega_0\mathbf{k}$$
$$\bar{\mathbf{v}} = 0.0884a\omega_0\mathbf{k} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 18.32

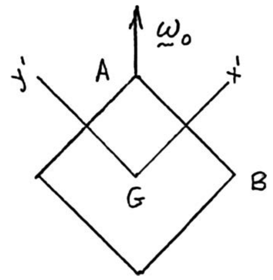
Determine the impulse exerted on the plate of Problem 18.31 during the impact by (*a*) the obstruction at *B*, (*b*) the support at *A*.

PROBLEM 18.31 A square plate of side *a* and mass *m* supported by a ball-and-socket joint at *A* is rotating about the *y* axis with a constant angular velocity $\boldsymbol{\omega} = \omega_0 \mathbf{j}$ when an obstruction is suddenly introduced at *B* in the *xy* plane. Assuming the impact at *B* to be perfectly plastic $(e = 0)$, determine immediately after impact (*a*) the angular velocity of the plate, (*b*) the velocity of its mass center *G*.

SOLUTION



For the simpler x' and y' axes, the initial angular velocity $\omega_0 \mathbf{j}$ has components

$$\omega_{x'} = \frac{\sqrt{2}}{2}\omega_0, \qquad \omega_{y'} = \frac{\sqrt{2}}{2}\omega_0,$$

Initial angular momentum about the mass center:

$$(\mathbf{H}_G)_0 = \bar{I}_{x'}\omega_{x'}\mathbf{i}' + \bar{I}_{y'}\omega_{y'}\mathbf{j}' = \frac{1}{12}ma^2\frac{\sqrt{2}}{2}\omega_0(\mathbf{i}' + \mathbf{j}')$$

Initial velocity of the mass center: $\quad \bar{\mathbf{v}}_0 = 0$

Let $\boldsymbol{\omega}$ be the angular velocity and $\bar{\mathbf{v}}$ be the velocity of the mass center immediately after impact.
Let $(F\Delta t)\mathbf{k}$ be the impulse at *B*.

Kinematics: $\quad \mathbf{v}_B = \boldsymbol{\omega} \times \mathbf{r}_{B/A} = (\omega_{x'}\mathbf{i}' + \omega_{y'}\mathbf{j}' + \omega_{z'}\mathbf{k}') \times (-a\mathbf{j}')$

$$\mathbf{v}_B = a(\omega_{z'}\mathbf{i}' + \omega_{x'}\mathbf{k}')$$

Since the corner *B* does not rebound, $\quad (v_B)_{z'} = 0 \quad \text{or} \quad \omega_{x'} = 0$

$$\bar{\mathbf{v}} = \boldsymbol{\omega} \times \mathbf{r}_{G/A} = (\omega_{y'}\mathbf{j}' + \omega_{z'}\mathbf{k}') \times \left(\frac{1}{2}a\right)(-\mathbf{i}' - \mathbf{j}')$$

$$= \frac{1}{2}a(\omega_{z'}\mathbf{i}' - \omega_{z'}\mathbf{j} + \omega_y\mathbf{k}')$$

Also, $\quad \mathbf{r}_{G/A} \times m\bar{\mathbf{v}} = \frac{1}{4}ma^2(-\omega_{y'}\mathbf{i}' + \omega_{y'}\mathbf{j}' + 2\omega_{z'}\mathbf{k}')$

and $\quad \mathbf{H}_G = I_{x'}\omega_{x'}\mathbf{i}' + I_{y'}\omega_{y'}\mathbf{j}' + \bar{I}_{z'}\omega_{z'}\mathbf{k}'$

$$= \frac{1}{12}ma^2\omega_{y'}\mathbf{j}' + \frac{1}{6}ma^2\omega_{z'}\mathbf{k}'$$

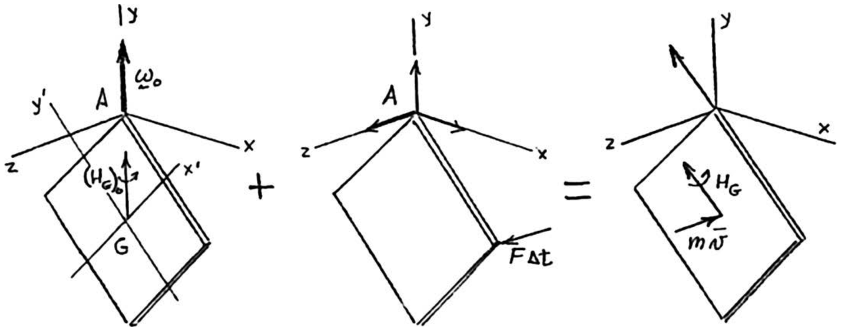
Principle of impulse-momentum.



Moments about A: $$(\mathbf{H}_A)_0 + (-a\mathbf{j}') \times (F\Delta t)\mathbf{k} = \mathbf{H}_A$$

$$(\mathbf{H}_G)_0 + \mathbf{r}_{G/A} \times m\overline{\mathbf{v}}_0 + aF\Delta t\mathbf{i}' = \mathbf{H}_G + \mathbf{r}_{G/A} \times m\overline{\mathbf{v}}$$

Resolve into components.

$$\mathbf{i}': \quad \frac{1}{24}\sqrt{2}ma^2\omega_0 - aF(\Delta t) = -\frac{1}{4}ma^2\omega_{y'} \qquad (1)$$

$$\mathbf{j}': \quad \frac{1}{24}\sqrt{2}ma^2\omega_0 = \frac{1}{12}ma^2\omega_{y'} + \frac{1}{4}ma^2\omega_{y'} \qquad \omega_{y'} = \frac{1}{8}\sqrt{2}\omega_0$$

$$\mathbf{k}': \quad 0 = \frac{1}{6}ma^2\omega_{z'} + \frac{1}{2}ma^2\omega_{z'} \qquad \omega_{z'} = 0$$

(*a*) From Eq. (1), $$F\Delta t = \frac{1}{24}\sqrt{2}ma\omega_0 + \frac{1}{32}\sqrt{2}ma\omega_0 = \frac{7}{96}\sqrt{2}ma\omega_0$$

$$(F\Delta t)\mathbf{k} = 0.1031ma\omega_0\mathbf{k} \blacktriangleleft$$

$$\overline{\mathbf{v}} = \frac{1}{2}a\omega_y\mathbf{k}' = \frac{1}{16}\sqrt{2}a\omega_0\mathbf{k}'$$

Linear momentum: $$m\overline{\mathbf{v}}_0 + \mathbf{A}\Delta t + F\Delta t\mathbf{k} = m\overline{\mathbf{v}}$$

$$0 + \mathbf{A}\Delta t + \frac{7}{96}\sqrt{2}ma\omega_0\mathbf{k}' = \frac{1}{16}\sqrt{2}ma\omega_0\mathbf{k}'$$

(*b*) $$\mathbf{A}\Delta t = -\frac{1}{96}\sqrt{2}ma\omega_0 \qquad \mathbf{A}\Delta t = -0.01473ma\omega_0\mathbf{k} \blacktriangleleft$$

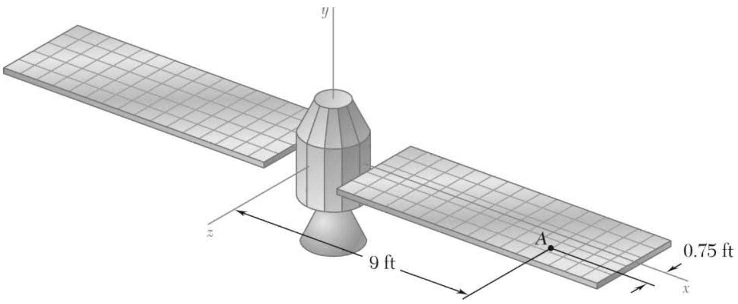
PROBLEM 18.33

The coordinate axes shown represent the principal centroidal axes of inertia of a 3000-lb space probe whose radii of gyration are $k_x = 1.375$ ft, $k_y = 1.425$ ft, and $k_z = 1.250$ ft. The probe has no angular velocity when a 5-oz meteorite strikes one of its solar panels at Point A with a velocity $\mathbf{v}_0 = (2400 \text{ ft/s})\mathbf{i} - (3000 \text{ ft/s})\mathbf{j} + (3200 \text{ ft/s})\mathbf{k}$ relative to the probe. Knowing that the meteorite emerges on the other side of the panel with no change in the direction of its velocity, but with a speed reduced by 20 percent, determine the final angular velocity of the probe.



SOLUTION

Masses: Space probe: $m' = \dfrac{3000}{32.2} = 93.17 \text{ lb} \cdot \text{s}^2/\text{ft}$

Meteorite: $m = \dfrac{5}{(16)(32.2)} = 0.009705 \text{ lb} \cdot \text{s}^2/\text{ft}$

Point of impact: $\text{r}_A = (9 \text{ ft})\mathbf{i} + (0.75 \text{ ft})\mathbf{k}$

Initial linear momentum of the meteorite, $(\text{lb} \cdot \text{s})$:

$$m\mathbf{v}_0 = (0.009705)(2400\mathbf{i} + 3000\mathbf{j} + 3200\mathbf{k}) = 23.292\mathbf{i} - 29.115\mathbf{j} + 31.056\mathbf{k}$$

Its moment about the origin, $(\text{lb} \cdot \text{ft} \cdot \text{s})$:

$$\mathbf{r}_A \times m\mathbf{v}_0 = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 9 & 0 & 0.75 \\ 23.292 & -29.115 & 31.056 \end{vmatrix} = 21.836\mathbf{i} - 262.04\mathbf{j} - 262.04\mathbf{k}$$

Final linear momentum of meteorite and its moment about the origin, $(\text{lb} \cdot \text{s})$ and $(\text{lb} \cdot \text{s} \cdot \text{ft})$:

$$0.8m\mathbf{v}_0 = 18.634\mathbf{i} - 23.292\mathbf{j} + 24.845\mathbf{k}$$

$$\mathbf{r}_A \times (0.8m\mathbf{v}_0) = 17.469\mathbf{i} - 209.63\mathbf{j} - 209.63\mathbf{k}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 18.33 (Continued)

Let $\mathbf{H}_A$ be the angular momentum of the probe and m' be its mass. Conservation of angular momentum about the origin for a system of particles consisting of the probe plus the meteorite:

$$\mathbf{r}_A \times m\mathbf{v}_0 = \mathbf{H}_A + \mathbf{r}_A \times (0.8m\mathbf{v}_0)$$

$$\mathbf{H}_A = (4.367 \text{ lb}\cdot\text{s}\cdot\text{ft})\mathbf{i} - (52.41 \text{ lb}\cdot\text{s}\cdot\text{ft})\mathbf{j} - (52.41 \text{ lb}\cdot\text{s}\cdot\text{ft})\mathbf{k}$$

$$I_x\omega_x = (H_A)_x \qquad \omega_x = \frac{(H_A)_x}{m'k_x^2} = \frac{4.367}{(93.17)(1.375)^2} = 0.02479 \text{ rad/s}$$

$$I_y\omega_y = (H_A)_y \qquad \omega_y = \frac{(H_A)_y}{m'k_y^2} = \frac{-52.41}{(93.17)(1.425)^2} = -0.2770 \text{ rad/s}$$

$$I_z\omega_z = (H_A)_z \qquad \omega_z = \frac{(H_A)_z}{m'k_z^2} = \frac{-52.41}{(93.17)(1.250)^2} = -0.3600 \text{ rad/s}$$

$$\boldsymbol{\omega} = (0.0248 \text{ rad/s})\mathbf{i} - (0.277 \text{ rad/s})\mathbf{j} - (0.360 \text{ rad/s})\mathbf{k} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 18.34

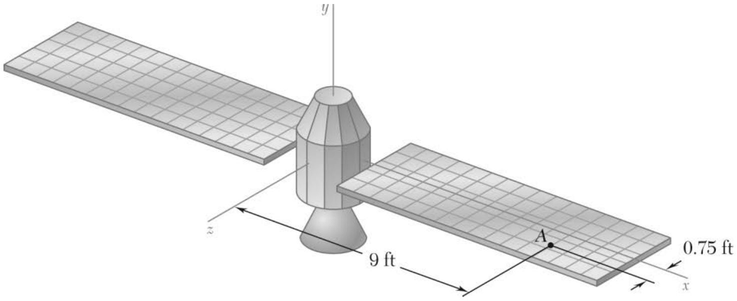
The coordinate axes shown represent the principal centroidal axes of inertia of a 3000-lb space probe whose radii of gyration are $k_x = 1.375$ ft, $k_y = 1.425$ ft, and $k_z = 1.250$ ft. The probe has no angular velocity when a 5-oz meteorite strikes one of its solar panels at Point A and emerges on the other side of the panel with no change in the direction of its velocity, but with a speed reduced by 25 percent. Knowing that the final angular velocity of the probe is $\boldsymbol{\omega} = (0.05 \text{ rad/s})\mathbf{i} - (0.12 \text{ rad/s})\mathbf{j} + \omega_z\mathbf{k}$ and that the x component of the resulting change in the velocity of the mass center of the probe is -0.675 in./s, determine (a) the component ω_z of the final angular velocity of the probe, (b) the relative velocity $\mathbf{v}_0$ with which the meteorite strikes the panel.



SOLUTION

Masses: Space probe: $m' = \dfrac{3000}{32.2} = 93.17 \text{ lb}\cdot\text{s}^2/\text{ft}$

Meteorite: $m = \dfrac{5}{(16)(32.2)} = 0.009705 \text{ lb}\cdot\text{s}^2/\text{ft}$

Point of impact: $\mathbf{r}_A = (9 \text{ ft})\mathbf{i} + (0.75 \text{ ft})\mathbf{k}$

Initial linear momentum of the meteorite, $(\text{lb}\cdot\text{s})$:

$$m\mathbf{v}_0 = (0.009705)(v_x\mathbf{i} + v_y\mathbf{j} + v_z\mathbf{k})$$

Its moment about the origin, $(\text{lb}\cdot\text{ft}\cdot\text{s})$:

$$(\mathbf{H}_A)_0 = \mathbf{r}_A \times m\mathbf{v}_0 = 0.009705\begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 9 & 0 & 0.75 \\ v_x & v_y & v_z \end{vmatrix}$$

$$= 0.009705[-0.75v_y\mathbf{i} + (0.75v_x - 9v_z)\mathbf{j} + 9v_y\mathbf{k}]$$

Final linear momentum of the meteorite, $(\text{lb}\cdot\text{s})$:

$$0.75m\mathbf{v}_0 = 0.007279(v_x\mathbf{i} + v_y\mathbf{j} + v_z\mathbf{k})$$

Its moment about the origin, $(\text{lb}\cdot\text{ft}\cdot\text{s})$:

$$\mathbf{r}_A \times (0.75m\mathbf{v}_0) = 0.007279[-0.75v_y\mathbf{i} + (0.75v_x - 9v_z)\mathbf{j} + 9v_y\mathbf{k}]$$

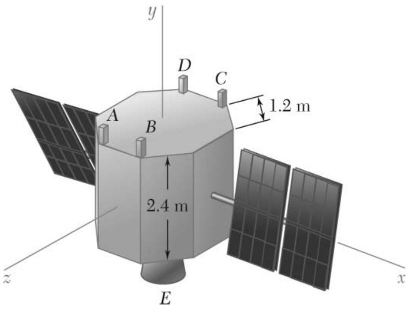
PROBLEM 18.35



A 2500-kg probe in orbit about the moon is 2.4 m high and has octagonal bases of sides 1.2 m. The coordinate axes shown are the principal centroidal axes of inertia of the probe, and its radii of gyration are $k_x = 0.98$ m, $k_y = 1.06$ m, and $k_z = 1.02$ m. The probe is equipped with a main 500-N thruster *E* and with four 20-N thrusters *A*, *B*, *C*, and *D* which can expel fuel in the positive *y* direction. The probe has an angular velocity $\boldsymbol{\omega} = (0.040 \text{ rad/s})\mathbf{i} + (0.060 \text{ rad/s})\mathbf{k}$ when two of the 20-N thrusters are used to reduce the angular velocity to zero. Determine (*a*) which of the thrusters should be used, (*b*) the operating time of each of these thrusters, (*c*) for how long the main thruster *E* should be activated if the velocity of the mass center of the probe is to remain unchanged.

SOLUTION

$$\mathbf{H}_G = I_x\omega_x\mathbf{i} + I_y\omega_y\mathbf{j} + I_z\omega_z\mathbf{k} = m\left(k_x^2\omega_x\mathbf{i} + k_y^2\omega_y^2\mathbf{j} + k_2^2\omega_z\mathbf{k}\right)$$

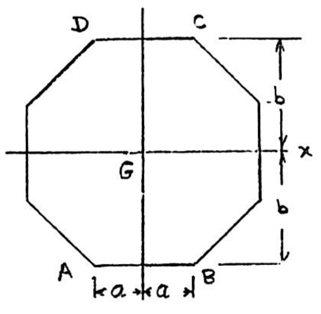
$$= (2500)[(0.98)^2(0.040)\mathbf{i} + (1.06)^2(0)\mathbf{j} + (1.02)^2(0.060)\mathbf{k}]$$

$$= (96.04 \text{ kg}\cdot\text{m}^2/\text{s})\mathbf{i} + (156.06 \text{ kg}\cdot\text{m}^2/\text{s})\mathbf{k}$$

Let $-A\mathbf{j}$, $-B\mathbf{j}$, $-C\mathbf{j}$, and $-D\mathbf{j}$ be the impulses provided by the 20 N thrusters at *A*, *B*, *C*, and *D*, respectively. Let $E\mathbf{j}$ be that provided by the 500 N main thruster.

Position vectors for intersections of the lines of action of the thruster impulses with the *xz* plane:

$$a = \frac{1}{2}(1.2) = 0.6 \text{ m}, \qquad b = 0.6 + 0.6\sqrt{2} = 1.4485 \text{ m}$$



$$\mathbf{r}_A = -a\mathbf{i} + b\mathbf{k}, \qquad \mathbf{r}_B = a\mathbf{i} + b\mathbf{k}$$

$$\mathbf{r}_C = a\mathbf{i} - b\mathbf{k}, \qquad \mathbf{r}_D = -a\mathbf{i} - b\mathbf{k}$$

The final linear and angular momenta are zero.

Principle of impulse-momentum. Moments about *G*:

$$\mathbf{H}_G + \mathbf{r}_A \times (-A\mathbf{j}) + \mathbf{r}_B \times (-B\mathbf{j}) + \mathbf{r}_C \times (-C\mathbf{j}) + \mathbf{r}_D \times (-D\mathbf{j}) = 0$$

$$\mathbf{H}_G + b(A + B - C - D)\mathbf{i} + a(A - B - C + D)\mathbf{k} = 0$$

Resolve into components.

$$\mathbf{i}: \quad A + B - C - D = -\frac{(H_G)_x}{b} = -\frac{96.04}{1.4485} = -66.30 \text{ N}\cdot\text{s} \qquad (1)$$

$$\mathbf{k}: \quad A - B - C + D = -\frac{(H_G)_z}{a} = -\frac{156.06}{0.6} = -260.1 \text{ N}\cdot\text{s} \qquad (2)$$

Of *A*, *B*, *C*, and *D*, two must be zero or positive, the other two zero.

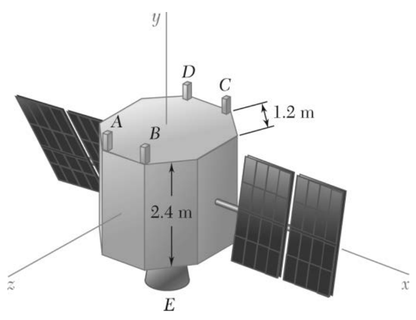
PROBLEM 18.36



Solve Problem 18.35, assuming that the angular velocity of the probe is $\boldsymbol{\omega} = (0.060\ \text{rad/s})\mathbf{i} - (0.040\ \text{rad/s})\mathbf{k}$.

PROBLEM 18.35 A 2500-kg probe in orbit about the moon is 2.4 m high and has octagonal bases of sides 1.2 m. The coordinate axes shown are the principal centroidal axes of inertia of the probe, and its radii of gyration are $k_x = 0.98$ m, $k_y = 1.06$ m, and $k_z = 1.02$ m. The probe is equipped with a main 500-N thruster E and with four 20-N thrusters A, B, C, and D which can expel fuel in the positive y direction. The probe has an angular velocity $\boldsymbol{\omega} = (0.040\ \text{rad/s})\mathbf{i} + (0.060\ \text{rad/s})\mathbf{k}$ when two of the 20-N thrusters are used to reduce the angular velocity to zero. Determine (*a*) which of the thrusters should be used, (*b*) the operating time of each of these thrusters, (*c*) for how long the main thruster E should be activated if the velocity of the mass center of the probe is to remain unchanged.

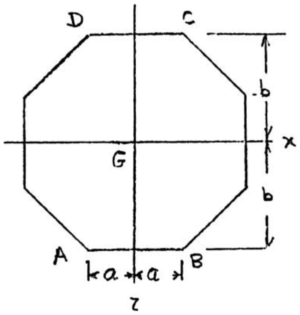
SOLUTION

$$\begin{aligned}\mathbf{H}_G &= I_x\omega_x\mathbf{i} + I_y\omega_y\mathbf{j} + I_z\omega_z\mathbf{k}\\ &= m\left(k_x^2\omega_x\mathbf{i} + k_y^2\omega_y^2\mathbf{j} + k_2^2\omega_z\mathbf{k}\right)\\ &= (2500)[(0.98)^2(0.060) + (1.06)^2(0) + (1.02)^2(-0.040)\mathbf{k}]\\ &= (144.06\ \text{kg}\cdot\text{m}^2/\text{s})\mathbf{i} - (104.04\ \text{kg}\cdot\text{m}^2/\text{s})\mathbf{k}\end{aligned}$$

Let $-A\mathbf{j}, -B\mathbf{j}, -C\mathbf{j},$ and $-D\mathbf{j}$ be the impulses provided by the 20 N thrusters at A, B, C, and D, respectively. Let $E\mathbf{j}$ be that provided by the 500 N main thruster.

Position vectors for intersections of the lines of action of the thruster impulses with the xz plane:

$$a = \frac{1}{2}(1.2) = 0.6\ \text{m}, \qquad b = 0.6 + 0.6\sqrt{2} = 1.4485\ \text{m}$$



$$\mathbf{r}_A = -a\mathbf{i} + b\mathbf{k}, \qquad \mathbf{r}_B = a\mathbf{i} + b\mathbf{k}$$

$$\mathbf{r}_C = a\mathbf{i} - b\mathbf{k}, \qquad \mathbf{r}_D = -a\mathbf{i} - b\mathbf{k}$$

The final linear and angular momenta are zero.

Principle of impulse-momentum. Moments about G:

$$\mathbf{H}_G + \mathbf{r}_A \times (-A\mathbf{j}) + \mathbf{r}_B \times (-B\mathbf{j}) + \mathbf{r}_C \times (-C\mathbf{j}) + \mathbf{r}_D \times (-D\mathbf{j}) = 0$$

$$\mathbf{H}_G + b(A + B - C - D)\mathbf{i} + a(A - B - C + D)\mathbf{k} = 0$$

PROBLEM 18.38

Show that the kinetic energy of a rigid body with a fixed Point O can be expressed as $T = \frac{1}{2} I_{OL} \omega^2$, where ω is the instantaneous angular velocity of the body and I_{OL} is its moment of inertia about the line of action OL of ω. Derive this expression (*a*) from Eqs. (9.46) and (18.19), (*b*) by considering T as the sum of the kinetic energies of particles P_i describing circles of radius ρ_i about line OL.

SOLUTION

(*a*)

$$T = \frac{1}{2}\left(I_x \omega_x^2 + I_y \omega_y^2 + I_z \omega_z^2 - 2I_{xy}\omega_x\omega_y - 2I_{yz}\omega_y\omega_z - 2I_{xz}\omega_x\omega_z\right)$$

Let

$$\omega_x = \omega \cos\theta_x = \omega\lambda_x$$

$$\omega_y = \omega \cos\theta_y = \omega\lambda_y$$

$$\omega_z = \omega \cos\theta_z = \omega\lambda_z$$

$$T = \frac{1}{2}\left(I_x \lambda_x^2 + I_y \lambda_y^2 + I_z \lambda_z^2 - 2I_{xy}\lambda_x\lambda_y - 2I_{yz}\lambda_y\lambda_z - 2I_{xz}\lambda_x\lambda_z\right)\omega^2$$

$$= \frac{1}{2} I_{OL}\omega^2$$

$T = \frac{1}{2} I_{OL}\omega^2$ ◀

(*b*) Each particle of mass $(\Delta m)_i$ describes a circle of radius ρ_i.

The speed of the particle is $v_i = \rho_i \omega$.

Its kinetic energy is

$$(\Delta T)_i = \frac{1}{2}(\Delta m_i)v_i^2 = \frac{1}{2}(\Delta m_i)\rho_i^2\omega^2$$

The kinetic energy of the entire body is

$$T = \Sigma(\Delta T)_i = \frac{1}{2}\Sigma(\Delta m_i)\rho_i^2\omega^2$$

but

$$I_{OL} = \Sigma(\Delta m_i)\rho_i^2$$

Hence, $T = \frac{1}{2} I_{OL}\omega^2$ ◀

PROBLEM 18.39

Determine the kinetic energy of the disk of Problem 18.1.

PROBLEM 18.1 A thin, homogeneous disk of mass m and radius r spins at the constant rate ω_1 about an axle held by a fork-ended vertical rod, which rotates at the constant rate ω_2. Determine the angular momentum $\mathbf{H}_G$ of the disk about its mass center G.

SOLUTION

Angular velocity: $\boldsymbol{\omega} = \omega_2 \mathbf{j} + \omega_1 \mathbf{k}$

Moments of inertia: $\bar{I}_x = \frac{1}{4}mr^2, \quad \bar{I}_y = \frac{1}{4}mr^2, \quad \bar{I}_z = \frac{1}{2}mr^2$

Products of inertia: by symmetry, $\bar{I}_{xy} = \bar{I}_{yz} = \bar{I}_{zx} = 0$

Kinetic energy:

$$T = \frac{1}{2}\left(\bar{I}_x \omega_x^2 + \bar{I}_y \omega_y^2 + \bar{I}_z \omega_z\right)$$

$$T = \frac{1}{2}\left[0 + \left(\frac{1}{4}mr^2\right)\omega_2^2 + \left(\frac{1}{2}mr^2\right)\omega_1^2\right]$$

$$T = \frac{1}{8}mr^2\left(\omega_2^2 + 2\omega_1^2\right) \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. PROBLEM 18.40

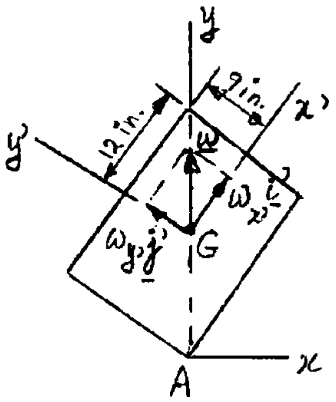
Determine the kinetic energy of the plate of Problem 18.2.

PROBLEM 18.2 A thin rectangular plate of weight 15 lb rotates about its vertical diagonal *AB* with an angular velocity ω. Knowing that the z axis is perpendicular to the plate and that ω is constant and equal to 5 rad/s, determine the angular momentum of the plate about its mass center *G*.

SOLUTION



$$h = \sqrt{(9\text{ in.})^2 + (12\text{ in.})^2} = 15\text{ in.}$$

Resolving ω along the principal axes x', y', z:

$$\omega_{x'} = \frac{12}{15}\omega = 0.8(5\text{ rad/s}) = 4\text{ rad/s}$$

$$\omega_{y'} = \frac{9}{15}\omega = 0.6(5\text{ rad/s}) = 3\text{ rad/s}$$

$$\omega_z = 0$$

Moments of inertia:

$$I_{x'} = \frac{1}{12}\left(\frac{15\text{ lb}}{32.2}\right)\left(\frac{9}{12}\text{ft}\right) = 0.021836\text{ slug}\cdot\text{ft}^2$$

$$I_{y'} = \frac{1}{12}\left(\frac{15\text{ lb}}{32.2}\right)\left(\frac{12}{12}\text{ft}\right)^2 = 0.038820\text{ slug}\cdot\text{ft}^2$$

From Eqs. (18.20):

$$T = \frac{1}{2}(\bar{I}_{x'}\omega_{x'}^2 + \bar{I}_{y'}\omega_{y'}^2 + \bar{I}_{z'}\omega_{z'}^2)$$

$$= \frac{1}{2}[(0.021836)(4)^2 + (0.038820)(3)^2 + 0]$$

$$T = 0.34938\text{ ft}\cdot\text{lb}$$

$$T = 0.349\text{ ft}\cdot\text{lb} \blacktriangleleft$$

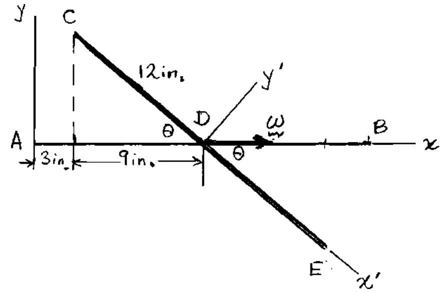
PROBLEM 18.41

Determine the kinetic energy of the assembly of Problem 18.3.

PROBLEM 18.3 Two uniform rods *AB* and *CE*, each of weight 3 lb and length 2 ft, are welded to each other at their midpoints. Knowing that this assembly has an angular velocity of constant magnitude $\omega = 12$ rad/s, determine the magnitude and direction of the angular momentum $\mathbf{H}_D$ of the assembly about *D*.

SOLUTION



$$m = \frac{W}{g} = \frac{3}{32.2} = 0.093168 \text{ lb}\cdot\text{s}^2/\text{ft}, \qquad l = 24 \text{ in.} = 2 \text{ ft},$$

$$\boldsymbol{\omega} = (12 \text{ rad/s})\mathbf{i}$$

For rod *ADB*, $T = \frac{1}{2}I_x\omega^2 \approx 0, \text{ since } I_x \approx 0.$

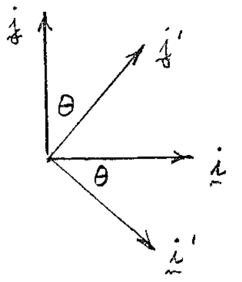
For rod *CDE*, use principal axes x', y' as shown.

$$\cos\theta = \frac{9}{12}, \qquad \theta = 41.410°$$

$$\omega_{x'} = \omega\cos\theta = 9 \text{ rad/s}^2$$

$$\omega_{y'} = \omega\sin\theta = 7.93725 \text{ rad/s}^2$$

$$\omega_{z'} = 0$$



$$\bar{I}_{x'} \approx 0$$

$$\bar{I}_{y'} = \frac{1}{12}ml^2 = \frac{1}{12}(0.093168)(2)^2$$

$$= 0.0310559 \text{ lb}\cdot\text{s}^2\cdot\text{ft}$$

$$T = \frac{1}{2}m\bar{v}^2 + \frac{1}{2}\bar{I}_{x'}\omega_{x'}^2 + \frac{1}{2}\bar{I}_{y'}\omega_{y'}^2 + \frac{1}{2}\bar{I}_{z'}\omega_{z'}^2$$

$$= 0 + 0 + \frac{1}{2}(0.0310559)(7.93725)^2 + 0$$

$$= 0.97826 \text{ ft}\cdot\text{lb} \qquad T = 0.978 \text{ ft}\cdot\text{lb} ◀$$

PROBLEM 18.42

Determine the kinetic energy of the disk of Problem 18.4.

PROBLEM 18.4 A homogeneous disk of weight $W = 6$ lb rotates at the constant rate $\omega_1 = 16$ rad/s with respect to arm *ABC*, which is welded to a shaft *DCE* rotating at the constant rate $\omega_2 = 8$ rad/s. Determine the angular momentum $\mathbf{H}_A$ of the disk about its center *A*.

SOLUTION

$$m = \frac{W}{g} = \frac{6}{32.2} = 0.1863 \text{ lb}\cdot\text{s}^2/\text{ft}$$

$$\boldsymbol{\omega} = \omega_2\mathbf{i} + \omega_1\mathbf{j} = (8 \text{ rad/s})\mathbf{i} + (16 \text{ rad/s})\mathbf{j}$$

For axes x', y', z' parallel to x, y, z with origin at A,

$$\bar{I}_{x'} = \frac{1}{4}mr^2 = \frac{1}{4}(0.1863)\left(\frac{8}{12}\right)^2 = 0.0207 \text{ lb}\cdot\text{s}^2\cdot\text{ft}$$

$$\bar{I}_{z'} = \bar{I}_{x'} = 0.0207 \text{ lb}\cdot\text{s}^2\cdot\text{ft}, \quad \bar{I}_{y'} = \bar{I}_{x'} + \bar{I}_{z'} = 0.0414 \text{ lb}\cdot\text{s}^2\cdot\text{ft}$$

Point A is the mass center of the disk.

$$\mathbf{r}_{A/C} = (9 \text{ in.})\mathbf{i} - (9 \text{ in.})\mathbf{k} = (0.75 \text{ ft})\mathbf{i} - (0.75 \text{ ft})\mathbf{k}$$

$$\bar{\mathbf{v}} = \mathbf{v}_A = \omega_2\mathbf{i}\times\mathbf{r}_{A/C} = 8\mathbf{i}\times(0.75\mathbf{j} - 0.75\mathbf{k})$$

$$= (6 \text{ ft/s})\mathbf{j} + (6 \text{ ft/s})\mathbf{k}$$

$$\bar{v} = \sqrt{(6)^2 + (6)^2} = 8.4853 \text{ ft/s}$$

Kinetic energy:

$$T = \frac{1}{2}m\bar{v}^2 + \frac{1}{2}\bar{I}_{x'}\omega_x^2 + \frac{1}{2}\bar{I}_{y'}\omega_y^2 + \frac{1}{2}\bar{I}_{z'}\omega_z^2$$

$$T = \frac{1}{2}(0.1863)(8.4853)^2 + \frac{1}{2}(0.0207)(8)^2 + \frac{1}{2}(0.0414)(16)^2 + 0$$

$$= 6.7068 + 0.6624 + 5.2992 = 12.6684 \text{ ft}\cdot\text{lb}$$

$T = 12.67$ ft · lb ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 18.43

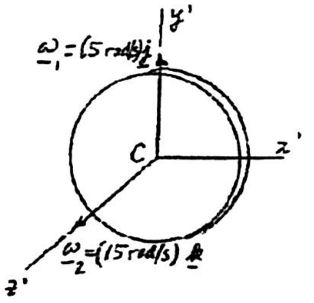
Determine the kinetic energy of the disk of Problem 18.5.

PROBLEM 18.5 A thin disk of mass $m = 4$ kg rotates at the constant rate $\omega_2 = 15$ rad/s with respect to arm *ABC*, which itself rotates at the constant rate $\omega_1 = 5$ rad/s about the *y* axis. Determine the angular momentum of the disk about its center *C*.

SOLUTION



$$r = 150 \text{ mm}$$

Angular velocity of disk:

$$\boldsymbol{\omega} = \omega_1 \mathbf{j} + \omega_2 \mathbf{k}$$
$$= (5 \text{ rad/s})\mathbf{j} + (15 \text{ rad/s})\mathbf{k}$$

Centroidal moments of inertia:

$$\bar{I}_{x'} = \bar{I}_{y'} = \frac{1}{4}mr^2$$
$$= \frac{1}{4}(4)(0.150 \text{ m})^2 = 0.0225 \text{ kg} \cdot \text{m}^2$$
$$\bar{I}_{z'} = \frac{1}{2}mr^2 = 0.045 \text{ kg} \cdot \text{m}^2$$

Location of mass center. $\mathbf{r}_{C/A} = (0.450 \text{ m})\mathbf{i} + (0.225 \text{ m})\mathbf{j}$

Velocity of mass center. $\bar{\mathbf{v}} = \boldsymbol{\omega}_1 \times \mathbf{r}_{C/A} = 5\mathbf{j} \times (0.45\mathbf{i} + 0.225\mathbf{j})$

$$= -(2.25 \text{ m/s})\mathbf{k}$$

Kinetic energy:

$$T = \frac{1}{2}m\bar{v}^2 + \frac{1}{2}\bar{I}_x\omega_x^2 + \frac{1}{2}\bar{I}_y\omega_y^2 + \frac{1}{2}\bar{I}_z\omega_z^2$$
$$= \frac{1}{2}(4)(2.25)^2 + 0 + \frac{1}{2}(0.0225)(5)^2 + \frac{1}{2}(0.0450)(15)^2$$
$$= 10.125 + 0 + 0.28125 + 5.0625$$

$T = 15.47$ J ◄

PROBLEM 18.44

Determine the kinetic energy of the solid parallelepiped of Problem 18.6.

PROBLEM 18.6 A solid rectangular parallelepiped of mass m has a square base of side a and a length $2a$. Knowing that it rotates at the constant rate ω about its diagonal AC' and that its rotation is observed from A as counterclockwise, determine (a) the magnitude of the angular momentum $\mathbf{H}_G$ of the parallelepiped about its mass center G, (b) the angle that $\mathbf{H}_G$ forms with the diagonal AC'.

SOLUTION

Body diagonal: $$d = \sqrt{a^2 + (2a)^2 + a^2} = \sqrt{6}a$$

$$\boldsymbol{\omega} = \frac{\omega}{d}(-a\mathbf{i} + 2a\mathbf{j} - a\mathbf{k}) = -\frac{\omega}{\sqrt{6}}\mathbf{i} + \frac{2\omega}{\sqrt{6}}\mathbf{j} - \frac{\omega}{\sqrt{6}}\mathbf{k}$$

$$I_x = \frac{1}{12}m[(2a)^2 + a^2] = \frac{5}{12}ma^2$$

$$I_y = \frac{1}{12}m[a^2 + a^2] = \frac{1}{6}ma^2$$

$$I_z = \frac{1}{12}m[a^2 + (2a)^2] = \frac{5}{12}ma^2$$

Axis of rotation passes through the mass center, hence $\overline{\mathbf{v}} = 0$.

Kinetic energy: $$T = \frac{1}{2}m\bar{v}^2 + \frac{1}{2}I_x\omega_x^2 + \frac{1}{2}I_y\omega_y^2 + \frac{1}{2}I_z\omega_z^2$$

$$T = 0 + \frac{1}{2}\left(\frac{5}{12}ma^2\right)\left(\frac{\omega}{\sqrt{6}}\right)^2 + \frac{1}{2}\left(\frac{1}{6}ma^2\right)\left(\frac{2\omega}{\sqrt{6}}\right)^2 + \frac{1}{2}\left(\frac{5}{12}ma^2\right)\left(\frac{\omega}{\sqrt{6}}\right)^2 = \frac{1}{8}ma^2\omega^2$$

$$T = 0.1250\ ma^2\omega^2 \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 18.45

Determine the kinetic energy of the hollow parallelepiped of Problem 18.7.

PROBLEM 18.7 Solve Problem 18.6, assuming that the solid rectangular parallelepiped has been replaced by a hollow one consisting of six thin metal plates welded together.

SOLUTION

Body diagonal: $d = \sqrt{a^2 + (2a)^2 + a^2} = \sqrt{6}a$

$$\boldsymbol{\omega} = \frac{\omega}{d}(-a\mathbf{i} + 2a\mathbf{j} - a\mathbf{k}) = -\frac{\omega}{\sqrt{6}}\mathbf{i} + \frac{2\omega}{\sqrt{6}}\mathbf{j} - \frac{\omega}{\sqrt{6}}\mathbf{k}$$

$$\text{Total area} = 2(a^2 + 2a^2 + 2a^2) = 10a^2$$

For each square plate, $m' = \frac{1}{10}m$

$$I_x = \frac{1}{12}m'a^2 + m'a^2 = \frac{13}{12}m'a^2 = \frac{13}{120}ma^2$$

$$I_y = \frac{1}{6}m'a^2 = \frac{1}{60}ma^2$$

$$I_z = I_x = \frac{13}{120}ma^2$$

For each plate parallel to the *yz* plane, $m' = \frac{1}{5}m$

$$I_x = \frac{1}{12}m'[a^2 + (2a)^2] = \frac{5}{12}m'a^2 = \frac{1}{12}ma^2$$

$$I_y = \frac{1}{12}m'a^2 + m'\left(\frac{a}{2}\right)^2 = \frac{1}{3}m'a^2 = \frac{1}{15}ma^2$$

$$I_z = \frac{1}{12}m'(2a)^2 + m'\left(\frac{a}{2}\right)^2 = \frac{7}{12}m'a^2 = \frac{7}{60}ma^2$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 18.45 (Continued)

For each plate parallel to the *xy* plane, $m' = \frac{1}{5}m$

$$I_x = \frac{1}{12}m'(2a)^2 + m'\left(\frac{a}{2}\right)^2 = \frac{7}{12}m'a^2 = \frac{7}{60}ma^2$$

$$I_y = \frac{1}{12}m'a^2 + m'\left(\frac{a}{2}\right)^2 = \frac{1}{3}m'a^2 = \frac{1}{15}ma^2$$

$$I_z = \frac{1}{12}m'[a^2 + (2a)^2] = \frac{5}{12}m'a^2 = \frac{1}{12}ma^2$$

Total moments of inertia:

$$I_x = 2\left(\frac{13}{120} + \frac{1}{12} + \frac{7}{60}\right)ma^2 = \frac{37}{60}ma^2$$

$$I_y = 2\left(\frac{1}{60} + \frac{1}{15} + \frac{1}{15}\right)ma^2 = \frac{3}{10}ma^2$$

$$I_z = 2\left(\frac{13}{120} + \frac{7}{60} + \frac{1}{12}\right)ma^2 = \frac{37}{60}ma^2$$

Axis of rotation passes through the mass center, hence $\overline{\mathbf{v}} = 0.$

Kinetic energy:

$$T = \frac{1}{2}m\overline{v}^2 + \frac{1}{2}I_x\omega_x^2 + \frac{1}{2}I_y\omega_y^2 + \frac{1}{2}I_z\omega_z^2$$

$$T = 0 + \frac{1}{2}\left(\frac{37}{60}ma^2\right)\left(\frac{\omega}{\sqrt{6}}\right)^2 + \frac{1}{2}\left(\frac{3}{10}ma^2\right)\left(\frac{2\omega}{\sqrt{6}}\right)^2 + \frac{1}{2}\left(\frac{37}{60}ma^2\right)\left(\frac{\omega}{\sqrt{6}}\right)^2 = \frac{73}{360}\, ma^2\omega^2$$

$T = 0.203\ ma^2\omega^2$ ◀

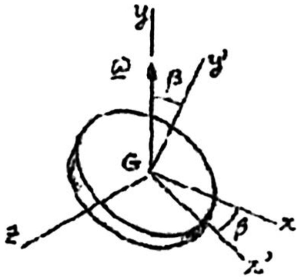
PROBLEM 18.46

Determine the kinetic energy of the disk of Problem 18.8.

PROBLEM 18.8 A homogeneous disk of mass m and radius r is mounted on the vertical shaft AB. The normal to the disk at G forms an angle $\beta = 25°$ with the shaft. Knowing that the shaft has a constant angular velocity ω, determine the angle θ formed by the shaft AB and the angular momentum $\mathbf{H}_G$ of the disk about its mass center G.

SOLUTION

Use the principal centroidal axes $Gx'y'z$.



Moments of inertia.

$$\bar{I}_{x'} = \bar{I}_z = \frac{1}{4}mr^2$$

$$\bar{I}_{y'} = \frac{1}{2}mr^2$$

Angular velocities.

$$\omega_{x'} = -\omega \sin\beta$$

$$\omega_{y'} = \omega\cos\beta$$

$$\omega_z = 0$$

Kinetic energy:

$$T = \frac{1}{2}m\bar{v}^2 + \frac{1}{2}\bar{I}_{x'}^2\omega_{x'}^2 + \frac{1}{2}\bar{I}_{y'}\omega_{y'}^2 + \frac{1}{2}\bar{I}_{z'}\omega_{z'}^2$$

$$= 0 + \frac{1}{2}\cdot\frac{1}{4}mr^2(-\omega\sin\beta)^2 + \frac{1}{2}\cdot\frac{1}{2}mr^2(\omega\cos\beta)^2 + 0$$

$$= \frac{1}{8}mr^2\omega^2(\sin^2\beta + 2\cos^2\beta)$$

$$= \frac{1}{8}mr^2\omega^2(\sin^2 25° + 2\cos^2 25°)$$

$T = 0.228\, mr^2\omega^2$ ◀

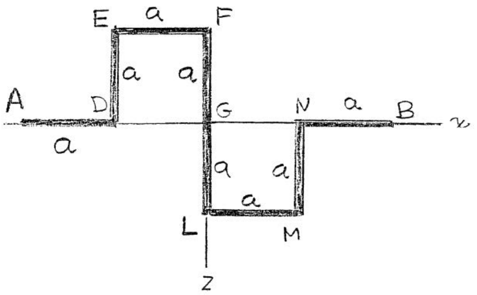
PROBLEM 18.47

Determine the kinetic energy of the shaft of Problem 18.15.

PROBLEM 18.15 A 5-kg rod of uniform cross section is used to form the shaft shown. Knowing that the shaft rotates with a constant angular velocity $\boldsymbol{\omega}$ of magnitude 12 rad/s, determine (*a*) the angular momentum $\mathbf{H}_G$ of the shaft about its mass center *G*, (*b*) the angle formed by $\mathbf{H}_G$ and the axis *AB*.

SOLUTION



$$\omega = (12\text{ rad/s})\mathbf{i}, \qquad \omega_y = \omega_z = 0$$

$$T = \frac{1}{2}\bar{I}_x\omega_x^2 + \frac{1}{2}I_y\omega_y^2 + \frac{1}{2}I_z\omega_z^2 - I_{xy}\omega_x\omega_y - I_{yz}\omega_y\omega_z - I_{xz}\omega_x\omega_z$$

$$= \frac{1}{2}I_x\omega^2$$

The shaft is comprised of eight sections, each of length $a = 0.25\text{ m}$ and of mass $m' = \dfrac{m}{8} = 0.625\text{ kg}.$

$$\bar{I}_x = (4)\left(\frac{1}{3}m'a^2\right) + (2)(m'a^2) = \frac{10}{3}m'a^2 = \frac{10}{3}(0.625)(0.25)^2 = 0.130208\text{ kg}\cdot\text{m}^2$$

$$T = \frac{1}{2}(0.130208)(12)^2 = 9.38\text{ kg}\cdot\text{m}^2/\text{s}^2 = 9.38\text{ N}\cdot\text{m} = 9.38\text{ J}$$

$T = 9.38\text{ J}$ ◀

PROBLEM 18.48

Determine the kinetic energy of the body of Problem 18.17.

PROBLEM 18.17 Two L-shaped arms, each weighing 4 lb, are welded at the third points of the 2-ft shaft *AB*. Knowing that shaft *AB* rotates at the constant rate $\omega = 240$ rpm, determine (*a*) the angular momentum of the body about *A*, (*b*) the angle formed by the angular momentum and shaft *AB*.

SOLUTION

$$W = 4 \text{ lb} \quad m = \frac{4}{32.2} = 0.12422 \text{ lb} \cdot \text{s}^2/\text{ft}$$

$$a = 8 \text{ in.} = 0.66667 \text{ ft}$$

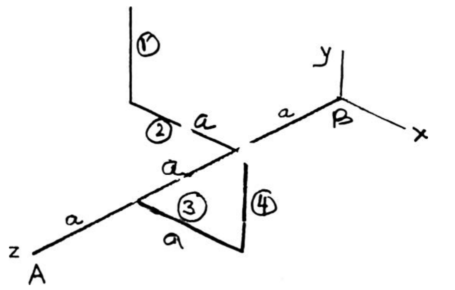
$$\omega = \frac{(2\pi)(240)}{60} = 8\pi \text{ rad/s}, \quad \omega_x = 0, \quad \omega_y = 0, \quad \omega_z = 8\pi \text{ rad/s}$$

For rotation about the fixed Point *B*, the kinetic energy is

$$T = \frac{1}{2}I_x\omega_x^2 + \frac{1}{2}I_y\omega_y^2 + \frac{1}{2}I_z\omega_z^2 - I_{xy}\omega_x\omega_y - I_{xz}\omega_x\omega_z - I_{yz}\omega_y\omega_z = \frac{1}{2}I_z\omega^2$$

Calculation of I_z: Segments 1, 2, 3, and 4, each of mass $m' = 0.06211 \text{ lb} \cdot \text{s}^2/\text{ft}$ contribute to

Part	I_z
①	$\left(\frac{1}{12} + \frac{1}{4} + 1\right)m'a^2$
②	$\frac{1}{3}m'a^2$
③	$\frac{1}{3}m'a^2$
④	$\left(\frac{1}{12} + \frac{1}{4} + 1\right)m'a^2$
Σ	$\frac{10}{3}m'a^2$



Kinetic energy: $$T = \frac{1}{2}\left(\frac{10}{3}m'a^2\right)\omega^2 = \frac{1}{2}\left(\frac{10}{3}\right)(0.06211)(0.66667)^2(8\pi)^2$$ $T = 29.1 \text{ ft} \cdot \text{lb}$ ◀

PROBLEM 18.49

Determine the kinetic energy of the triangular plate of Problem 18.19.

PROBLEM 18.19 The triangular plate shown has a mass of 7.5 kg and is welded to a vertical shaft *AB*. Knowing that the plate rotates at the constant rate $\omega = 12$ rad/s, determine its angular momentum about (*a*) Point *C*, (*b*) Point *A*. (*Hint*: To solve part *b* find $\bar{\mathbf{v}}$ and use the property indicated in part *a* of Problem 18.13.)

SOLUTION

$$\boldsymbol{\omega} = (12 \text{ rad/s})\mathbf{j}, \quad \omega_x = 0, \quad \omega_y = 12 \text{ rad/s}, \quad \omega_z = 0$$

Kinetic energy:

$$T = \frac{1}{2}I_x\omega_x^2 + \frac{1}{2}I_y\omega_y^2 + \frac{1}{2}I_z\omega_z^2 - I_{yz}\omega_y\omega_z - I_{zx}\omega_z\omega_x - I_{xy}\omega_x\omega_y$$

$$= \frac{1}{2}I_y\omega^2$$

For the plate:

$$b = AB = 90 + 160 = 250 \text{ mm} = 0.25 \text{ m}$$

$$h = CD = 120 \text{ mm} = 0.12 \text{ m}$$

Area:

$$A = \frac{1}{2}bh = 15\times 10^{-3} \text{ m}^2$$

$$(I_y)_{\text{area}} = \frac{1}{12}bh^3 = 36\times 10^{-6} \text{ m}^4$$

$$m = 7.5 \text{ kg}$$

$$(I_y)_{\text{mass}} = \frac{m}{A}(I_y)_{\text{area}} = \frac{(7.5)(36\times 10^{-6})}{15\times 10^{-3}} = 18\times 10^{-3} \text{ kg}\cdot\text{m}^2$$

$$T = \frac{1}{2}(18\times 10^{-3})(12)^2 = 1.296 \text{ J}$$

$T = 1.296$ J ◀

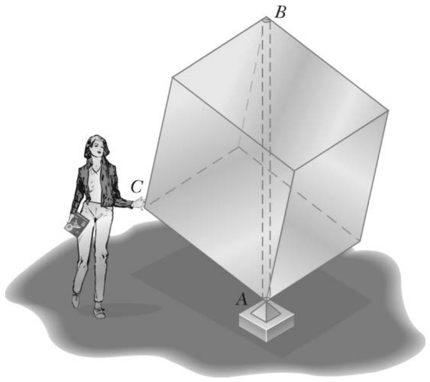
PROBLEM 18.50



Determine the kinetic energy imparted to the cube of Problem 18.21.

PROBLEM 18.21 One of the sculptures displayed on a university campus consists of a hollow cube made of six aluminum sheets, each 1.5×1.5 m, welded together and reinforced with internal braces of negligible weight. The cube is mounted on a fixed base at *A* and can rotate freely about its vertical diagonal *AB*. As she passes by this display on the way to a class in mechanics, an engineering student grabs corner *C* of the cube and pushes it for 1.2 s in a direction perpendicular to the plane *ABC* with an average force of 50 N. Having observed that it takes 5 s for the cube to complete one full revolution, she flips out her calculator and proceeds to determine the mass of the cube. What is the result of her calculation? (*Hint:* The perpendicular distance from the diagonal joining two vertices of a cube to any of its other six vertices can be obtained by multiplying the side of the cube by $\sqrt{2/3}$.)

SOLUTION

Let $m' = \frac{1}{6}m$ be the mass of one side of the cube. Choose *x*, *y*, and *z* axes perpendicular to the face of the cube. Let *a* be the side of the cube. For a side perpendicular to the *x* axis, $(I_x)_1 = \frac{1}{6}m'a^2$.

For a side perpendicular to the *y* or *z* axis, $(I_x)_2 = \left(\frac{1}{12}+\frac{1}{4}\right)m'a^2 = \frac{1}{3}m'a^2$

Total moment of inertia:
$$I_x = 2(I_x)_1 + 4(I_x)_2 = \frac{5}{3}m'a^2 = \frac{5}{18}ma^2$$

By symmetry, $I_y = I_x$ and $I_z = I_x$.

Since all three moments of inertia are equal, the ellipsoid of inertia is a sphere. All centroidal axes are principal axes.

Moment of inertia about the vertical axis:
$$I_v = \frac{5}{18}ma^2$$

Let $b = \sqrt{\frac{2}{3}}a$ be the moment arm of the impulse applied to the corner.

Using the impulse-momentum principle and taking moments about the vertical axis,

$$bF(\Delta t) = H_v = I_v\omega = \frac{5}{18}ma^2\omega \qquad (1)$$

Data:
$$a = 1.5 \text{ m}, \quad b = \sqrt{\frac{2}{3}}(1.5) = 1.22474 \text{ m}$$
$$\omega = \frac{2\pi}{5} = 1.25664 \text{ rad/s}, \quad F = 50 \text{ N}, \quad \Delta t = 1.2 \text{ s.}$$

If you are a student using this Manual, you are using it without permission.*

PROBLEM 18.50 (Continued)

Solving Equation (1) for m,

$$m = \frac{18}{5}\frac{bF(\Delta t)}{a^2\omega} = \frac{18}{5}\frac{(1.22474)(50)(1.2)}{(1.5)^2(1.25664)} = 93.563 \text{ kg}$$

$m = 93.6$ kg

For principal axes,

$$T = \frac{1}{2}I_x\omega_x^2 + \frac{1}{2}I_y\omega_y^2 + \frac{1}{2}I_z\omega_z^2$$

$$T = \frac{1}{2}I_v\omega^2 = \frac{1}{2}\left(\frac{5}{18}ma^2\right)\omega^2$$

$$= \frac{1}{2}\frac{5}{18}(93.563)(1.5)^2(1.2566)^2$$

$T = 46.2$ J ◀

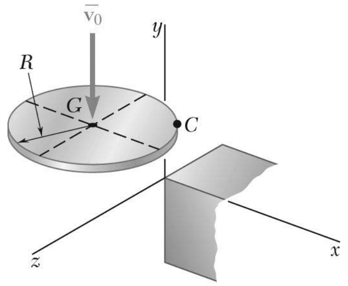
PROBLEM 18.51



Determine the kinetic energy lost when edge C of the plate of Problem 18.29 hits the obstruction.

SOLUTION

For principal moments of inertia, the kinetic energy is

$$T = \frac{1}{2}m\overline{v}^2 + \frac{1}{2}\overline{I}_x\omega_x^2 + \frac{1}{2}\overline{I}_y\omega_y^2 + \frac{1}{2}\overline{I}_z\omega_z^2$$

Before impact:

$$\overline{v} = \overline{v}_0$$

$$\omega_x = \omega_y = \omega_z = 0$$

$$T_0 = \frac{1}{2}m\overline{v}_0^2$$

After impact:

From Problem 18.30,

$$\overline{v}_x = \overline{v}_z = 0$$

$$\overline{v}_y = -\frac{4}{5}\overline{v}_0$$

$$\overline{v} = \frac{4}{5}\overline{v}_0$$

From Problem 18.29,

$$\omega_x = \omega_z = \frac{2\sqrt{2}}{5}\frac{v_0}{R}$$

$$\omega_y = 0$$

$$\overline{I}_x = \overline{I}_z = \frac{1}{4}mR^2$$

$$T = \frac{1}{2}m\left(\frac{4}{5}v_0\right)^2 + \left(\frac{1}{2}\right)\left(\frac{1}{4}mR^2\right)\left(\frac{2\sqrt{2}}{5}\frac{v_0}{R}\right)^2 + 0 + \left(\frac{1}{2}\right)\left(\frac{1}{4}mR^2\right)\left(\frac{2\sqrt{2}}{5}\frac{\overline{v}_0}{R}\right)^2$$

$$= \frac{1}{2}\left[\frac{16}{25} + \frac{2}{25} + 0 + \frac{2}{25}\right]m\overline{v}_0^2 = \frac{2}{5}m\overline{v}_0^2$$

Energy loss:

$$T_0 - T = \frac{1}{2}m\overline{v}_0^2 - \frac{2}{5}m\overline{v}_0^2$$

$$T_0 - T = \frac{1}{10}m\overline{v}_0^2 \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 18.52

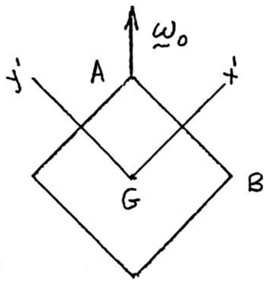
Determine the kinetic energy lost when the plate of Problem 18.31 hits the obstruction at *B*.

SOLUTION

For the x' and y' axes shown, the initial angular velocity $\omega_0 \mathbf{j}$ has components

$$\omega_{x'} = \frac{\sqrt{2}}{2}\omega_0, \quad \omega_{y'} = \frac{\sqrt{2}}{2}\omega_0$$



Initial angular momentum about the mass center:

$$(\mathbf{H}_G)_0 = \bar{I}_{x'}\omega_{x'}\mathbf{i}' + \bar{I}_{y'}\omega_{y'}\mathbf{j}'$$

$$= \frac{1}{12}ma^2 \frac{\sqrt{2}}{2}\omega_0(\mathbf{i}' + \mathbf{j}')$$

Initial velocity of the mass center: $\quad \bar{\mathbf{v}}_0 = 0$

Let $\boldsymbol{\omega}$ be the angular velocity and $\bar{\mathbf{v}}$ be the velocity of the mass center immediately after impact.
Let $(F\Delta t)\mathbf{k}$ be the impulse at *B*.

Kinematics:

$$\mathbf{v}_B = \boldsymbol{\omega} \times \mathbf{r}_{B/A} = (\omega_{x'}\mathbf{i}' + \omega_{y'}\mathbf{j}' + \omega_{z'}\mathbf{k}') \times (-a\mathbf{j}')$$

$$\mathbf{v}_B = a(\omega_{z'}\mathbf{i}' + \omega_{x'}\mathbf{k}')$$

Since the corner *B* does not rebound, $\quad (v_B)_{z'} = 0 \quad$ or $\quad \omega_{x'} = 0$

$$\bar{\mathbf{v}} = \boldsymbol{\omega} \times \mathbf{r}_{G/A} = (\omega_{y'}\mathbf{j}' + \omega_{z'}\mathbf{k}') \times \left(\frac{1}{2}a\right)(-\mathbf{i}' - \mathbf{j}')$$

$$= \frac{1}{2}a(\omega_{z'}\mathbf{i}' - \omega_{z'}\mathbf{j} + \omega_{y}\mathbf{k}')$$

Also,

$$\mathbf{r}_{G/A} \times m\bar{\mathbf{v}} = \frac{1}{4}ma^2(-\omega_{y'}\mathbf{i}' + \omega_{y'}\mathbf{j}' + 2\omega_{z'}\mathbf{k}')$$

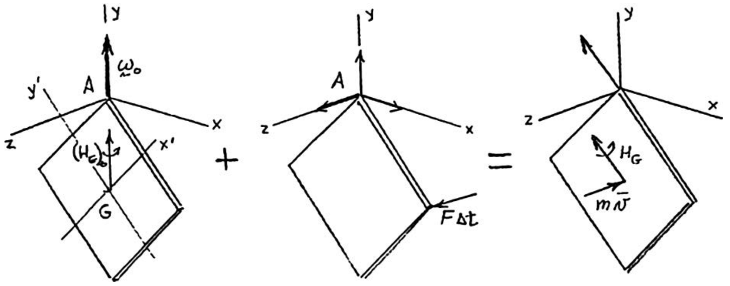
and

$$\mathbf{H}_G = I_{x'}\omega_{x'}\mathbf{i}' + I_{y'}\omega_{y'}\mathbf{j}' + \bar{I}_{z'}\omega_{z'}\mathbf{k}'$$

$$= \frac{1}{12}ma^2\omega_{y'}\mathbf{j}' + \frac{1}{6}ma^2\omega_{z'}\mathbf{k}'$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

Principle of impulse-momentum.



Moments about A:

$$(\mathbf{H}_A)_0 + (-a\mathbf{j})\times(F\Delta t)\mathbf{k} = \mathbf{H}_A$$

$$(\mathbf{H}_G)_0 + \mathbf{r}_{G/A}\times m\overline{\mathbf{v}}_0 - (aF\Delta t)\mathbf{i} = \mathbf{H}_G + \mathbf{r}_{G/A}\times m\overline{\mathbf{v}}$$

Resolve into components.

$$\mathbf{i}': \quad \frac{1}{24}\sqrt{2}ma^2\omega_0 - aF(\Delta t) = -\frac{1}{4}ma^2\omega_{y'}$$

$$\mathbf{j}': \quad \frac{1}{24}\sqrt{2}ma^2\omega_0 = \frac{1}{12}ma^2\omega_{y'} + \frac{1}{4}ma^2\omega_{y'} \quad \omega_{y'} = \frac{\sqrt{2}}{8}\omega_0$$

$$\mathbf{k}': \quad 0 = \frac{1}{6}ma^2\omega_{z'} + \frac{1}{2}ma^2\omega_{z'} \quad \omega_{z'} = 0$$

$$\boldsymbol{\omega} = \frac{\sqrt{2}}{8}\omega_0\mathbf{j}' = \frac{1}{8}\sqrt{2}\omega_0\frac{\sqrt{2}}{2}(\mathbf{j}-\mathbf{i})$$

$$\overline{\mathbf{v}} = \frac{1}{2}a\omega_y\mathbf{k}' = \frac{\sqrt{2}}{16}a\omega_0\mathbf{k}$$

Kinetic energy:

$$T = \frac{1}{2}m\overline{v}^2 + \frac{1}{2}\overline{I}_x\omega_{x'}^2 + \frac{1}{2}\overline{I}_y\omega_{y'}^2 + \frac{1}{2}\overline{I}_{z'}\omega_{z'}^2$$

Before impact:

$$\overline{v}_0 = 0, \quad \omega_{x'} = \frac{\sqrt{2}}{2}\omega_0, \quad \omega_{y'} = \frac{\sqrt{2}}{2}\omega_0, \quad \omega_{z'} = 0$$

$$T_0 = 0 + \frac{1}{2}\left(\frac{1}{12}ma^2\right)\left(\frac{\sqrt{2}}{2}\omega_0\right)^2 + \frac{1}{2}\left(\frac{1}{12}ma^2\right)\left(-\frac{\sqrt{2}}{2}\omega_0\right)^2 + 0 = \frac{1}{24}ma^2\omega_0^2$$

After impact:

$$\overline{v} = \frac{\sqrt{2}}{16}a\omega_0, \quad \omega_{x'} = 0, \quad \omega_{y'} = \frac{\sqrt{2}}{8}\omega_0, \quad \omega_{z'} = 0$$

$$T_1 = \frac{1}{2}m\left(\frac{\sqrt{2}}{16}a\omega_0\right)^2 + 0 + \frac{1}{2}\left(\frac{1}{12}ma^2\right)\left(\frac{\sqrt{2}}{8}\omega_0\right)^2 + 0 = \frac{1}{192}ma^2\omega_0^2$$

Kinetic energy lost.

$$T_0 - T_1 = \frac{7}{192}ma^2\omega_0^2 \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 18.53

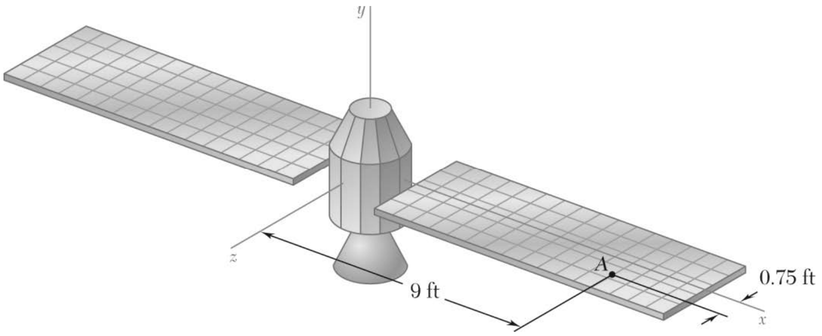
Determine the kinetic energy of the space probe of Problem 18.33 in its motion about its mass center after its collision with the meteorite.



SOLUTION

Masses: Space probe: $m' = \dfrac{3000}{32.2} = 93.17 \text{ lb}\cdot\text{s}^2/\text{ft}$

Meteorite: $m = \dfrac{5}{(16)(32.2)} = 0.009705 \text{ lb}\cdot\text{s}^2/\text{ft}$

Point of impact: $\mathbf{r}_A = (9 \text{ ft})\mathbf{i} + (0.75 \text{ ft})\mathbf{k}$

Initial linear momentum of the meteorite, $(\text{lb}\cdot\text{s})$:

$$m\mathbf{v}_0 = (0.009705)(2400\mathbf{i} + 3000\mathbf{j} + 3200\mathbf{k}) = 23.292\mathbf{i} - 29.115\mathbf{j} + 31.056\mathbf{k}$$

Its moment about the origin, $(\text{lb}\cdot\text{ft}\cdot\text{s})$:

$$\mathbf{r}_A \times m\mathbf{v}_0 = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 9 & 0 & 0.75 \\ 23.292 & -29.115 & 31.056 \end{vmatrix} = 21.836\mathbf{i} - 262.04\mathbf{j} - 262.04\mathbf{k}$$

Final linear momentum of meteorite and its moment about the origin, $(\text{lb}\cdot\text{s})$ and $(\text{lb}\cdot\text{s}\cdot\text{ft})$:

$$0.8m\mathbf{v}_0 = 18.634\mathbf{i} - 23.292\mathbf{j} + 24.845\mathbf{k}$$
$$\mathbf{r}_A \times (0.8m\mathbf{v}_0) = 17.469\mathbf{i} - 209.63\mathbf{j} - 209.63\mathbf{k}$$

PROBLEM 18.55

Determine the rate of change $\dot{\mathbf{H}}_G$ of the angular momentum $\mathbf{H}_G$ of the disk of Problem 18.1.

PROBLEM 18.1 A thin, homogeneous disk of mass m and radius r spins at the constant rate ω_1 about an axle held by a fork-ended vertical rod, which rotates at the constant rate ω_2. Determine the angular momentum $\mathbf{H}_G$ of the disk about its mass center G.

SOLUTION

Angular velocity: $\boldsymbol{\omega} = \omega_2 \mathbf{j} + \omega_1 \mathbf{k}$

Moments of inertia: $\bar{I}_x = \frac{1}{4} mr^2, \qquad \bar{I}_y = \frac{1}{4} mr^2, \qquad \bar{I}_z = \frac{1}{2} mr^2$

Products of inertia: by symmetry, $\bar{I}_{xy} = \bar{I}_{yz} = \bar{I}_{zx} = 0$

Angular momentum:

$$\mathbf{H}_G = \bar{I}_x \omega_x \mathbf{i} + \bar{I}_y \omega_y \mathbf{j} + \bar{I}_z \omega_z \mathbf{k}$$

$$\mathbf{H}_G = 0 + \left(\frac{1}{4} mr^2\right)\omega_2 \mathbf{j} + \frac{1}{2} mr^2 \omega_1 \mathbf{k}$$

$$\mathbf{H}_G = \frac{1}{4} mr^2 \omega_2 \mathbf{j} + \frac{1}{2} mr^2 \omega_1 \mathbf{k}$$

Rate of change of angular momentum. Let the frame of reference $Gxyz$ be rotating with angular velocity

$$\boldsymbol{\Omega} = \omega_1 \mathbf{j}$$

Then

$$\dot{\mathbf{H}}_G = (\dot{\mathbf{H}}_G)_{Gxyz} + \boldsymbol{\Omega} \times \mathbf{H}_G$$

$$= 0 + \omega_2 \mathbf{j} \times \left(\frac{1}{4} mr^2 \omega_2 \mathbf{j} + \frac{1}{2} mr^2 \omega_1 \mathbf{k}\right)$$

$$= \frac{1}{2} mr^2 \omega_1 \omega_2 \mathbf{i}$$

$\dot{\mathbf{H}}_G = \frac{1}{2} mr^2 \omega_1 \omega_2 \mathbf{i}$ ◀

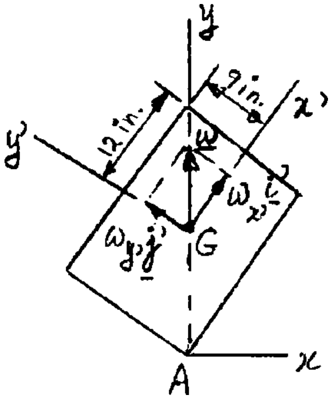
PROBLEM 18.56

Determine the rate of change $\dot{\mathbf{H}}_G$ of the angular momentum $\mathbf{H}_G$ of the plate of Problem 18.2.

PROBLEM 18.2 A thin rectangular plate of weight 15 lb rotates about its vertical diagonal *AB* with an angular velocity ω. Knowing that the *z* axis is perpendicular to the plate and that ω is constant and equal to 5 rad/s, determine the angular momentum of the plate about its mass center *G*.

SOLUTION

$$h = \sqrt{(9\text{ in.})^2 + (12\text{ in.})^2} = 15\text{ in.}$$



Resolving ω along the principal axes x', y', z:

$$\omega_{x'} = \frac{12}{15}\omega = 0.8(5\text{ rad/s}) = 4\text{ rad/s}$$

$$\omega_{y'} = \frac{9}{15}\omega = 0.6(5\text{ rad/s}) = 3\text{ rad/s}$$

$$\omega_z = 0$$

Moments of inertia:

$$I_{x'} = \frac{1}{12}\left(\frac{15\text{ lb}}{32.2}\right)\left(\frac{9}{12}\text{ft}\right)^2 = 0.021836\text{ slug}\cdot\text{ft}^2$$

$$I_{y'} = \frac{1}{12}\left(\frac{15\text{ lb}}{32.2}\right)\left(\frac{12}{12}\text{ft}\right)^2 = 0.038820\text{ slug}\cdot\text{ft}^2$$

From Eqs. (18.10):

$$H_{x'} = I_{x'}\omega_{x'} = (0.021836)(4) = 0.087345\text{ slug ft}^2/\text{s}$$

$$H_{y'} = I_{y'}\omega_{y'} = (0.038820)(3) = 0.11646\text{ slug ft}^2/\text{s}$$

$$H_z = I_z\omega_z = 0$$

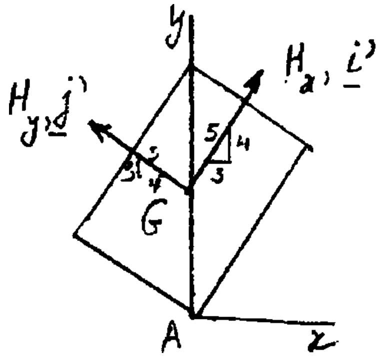
$$\mathbf{H}_G = (0.087345\text{ slug ft}^2/\text{s})\mathbf{i}' + (0.11646\text{ slug ft}^2/\text{s})\mathbf{j}'$$

All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 18.56 (Continued)

Components along x and y axes:

$$H_x = \frac{3}{5}H_{x'} - \frac{4}{5}H_{y'}$$
$$= \frac{3}{5}(0.087345) - \frac{4}{5}(0.11646)$$
$$= -0.040761$$
$$H_y = \frac{4}{5}H_{x'} + \frac{3}{5}H_{y'}$$
$$= \frac{4}{5}(0.087345) + \frac{3}{5}(0.11646)$$
$$= 0.13975$$



$$\mathbf{H}_G = (-0.040761\ \text{slug}\cdot\text{ft}^2/\text{s})\mathbf{i} + (0.13975\ \text{slug}\cdot\text{ft}^2/\text{s})\mathbf{j}$$

where the frame $Axyz$ rotates with the plate with the angular velocity.

$$\boldsymbol{\Omega} = \boldsymbol{\omega} = (5\ \text{rod/s})\mathbf{j}$$

We have $(\dot{\mathbf{H}}_G)_{Axyz} = 0.$ Substituting into Eq. (18.22):

$$\dot{\mathbf{H}}_G = (\dot{\mathbf{H}}_G)_{Axyz} + \boldsymbol{\Omega}\times\mathbf{H}_G = 0 + 5\mathbf{j}\times(-0.040761\mathbf{i} + 0.13975\mathbf{j})$$
$$= (0.20380\ \text{ft/lb})\mathbf{k}$$

$\dot{\mathbf{H}}_G = (0.204\ \text{ft/lb})\mathbf{k}$ ◀

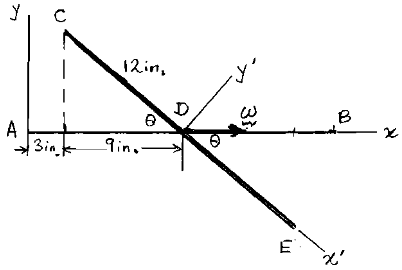
PROBLEM 18.57

Determine the rate of change $\dot{\mathbf{H}}_D$ of the angular momentum $\mathbf{H}_D$ of the assembly of Problem 18.3.

PROBLEM 18.3 Two uniform rods *AB* and *CE*, each of weight 3 lb and length 2 ft, are welded to each other at their midpoints. Knowing that this assembly has an angular velocity of constant magnitude $\omega = 12$ rad/s, determine the magnitude and direction of the angular momentum $\mathbf{H}_D$ of the assembly about *D*.

SOLUTION

$$m = \frac{W}{g} = \frac{3}{32.2} = 0.093168 \text{ lb}\cdot\text{s}^2/\text{ft}, \qquad l = 24 \text{ in.} = 2 \text{ ft},$$



$$\boldsymbol{\omega} = (12 \text{ rad/s})\mathbf{i}$$

For rod *ADB*, $\quad \mathbf{H}_D = I_x\omega\mathbf{i} \approx 0, \quad \text{since } I_x \approx 0.$

For rod *CDE*, use principal axes x', y' as shown.

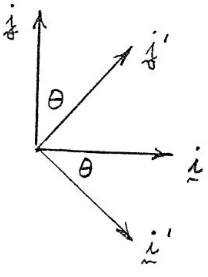
$$\cos\theta = \frac{9}{12}, \qquad \theta = 41.410°$$

$$\omega_{x'} = \omega\cos\theta = 9 \text{ rad/s}^2$$

$$\omega_{y'} = \omega\sin\theta = 7.93725 \text{ rad/s}^2$$

$$\omega_{z'} = 0$$

$$I_{x'} \approx 0$$



$$I_{y'} = \frac{1}{12}ml^2 = \frac{1}{12}(0.093168)(2)^2$$

$$= 0.0310559 \text{ lb}\cdot\text{s}^2\cdot\text{ft}$$

$$\mathbf{H}_D = I_{x'}\omega_{x'}\mathbf{i}' + I_{y'}\omega_{y'}\mathbf{j}' + I_{z'}\omega_{z'}\mathbf{k}'$$

$$= 0 + (0.0310559)(7.93725)\mathbf{j}' + 0$$

$$= 0.246498\mathbf{j}'$$

$$\mathbf{H}_D = 0.246498(\sin\theta\mathbf{i} + \cos\theta\mathbf{j}) = 0.163045\mathbf{i} + 0.184874\mathbf{j}$$

Let the frame of reference *Dxyz* be rotating with angular velocity

$$\boldsymbol{\Omega} = \boldsymbol{\omega} = (12 \text{ rad/s})\mathbf{i}$$

Then, $\quad \dot{\mathbf{H}}_D = (\dot{\mathbf{H}}_D)_{Dxyz} + \boldsymbol{\Omega}\times\mathbf{H}_D = 0 + \boldsymbol{\omega}\times\mathbf{H}_D$

$$\dot{\mathbf{H}}_D = 12\mathbf{i}\times(0.163045\mathbf{i} + 0.184874\mathbf{j}) \qquad \dot{\mathbf{H}}_D = (2.22 \text{ lb}\cdot\text{ft})\mathbf{k} \blacktriangleleft$$

PROBLEM 18.58

Determine the rate of change $\dot{\mathbf{H}}_A$ of the angular momentum $\mathbf{H}_A$ of the disk of Problem 18.4.

PROBLEM 18.4 A homogeneous disk of weight $W = 6$ lb rotates at the constant rate $\omega_1 = 16$ rad/s with respect to arm *ABC*, which is welded to a shaft *DCE* rotating at the constant rate $\omega_2 = 8$ rad/s. Determine the angular momentum $\mathbf{H}_A$ of the disk about its center *A*.

SOLUTION

$$\boldsymbol{\omega} = \omega_2\mathbf{i} + \omega_1\mathbf{j} = (8 \text{ rad/s})\mathbf{i} + (16 \text{ rad/s})\mathbf{j}$$

For axes x', y', z' parallel to x, y, z with origin at A,

$$m = \frac{W}{g} = \frac{6}{32.2} = 0.186335 \text{ lb}\cdot\text{s}^2/\text{ft}$$

$$\bar{I}_{x'} = \frac{1}{4}mr^2 = \frac{1}{4}(0.186335)\left(\frac{8}{12}\right)^2 = 0.020704 \text{ lb}\cdot\text{s}^2\cdot\text{ft}$$

$$\bar{I}_{z'} = \bar{I}_{x'} = 0.020704 \text{ lb}\cdot\text{s}^2\cdot\text{ft}$$

$$\bar{I}_{y'} = \bar{I}_{x'} + \bar{I}_{z'} = 0.041408 \text{ lb}\cdot\text{s}^2\cdot\text{ft}$$

$$\mathbf{H}_A = \bar{I}_{x'}\omega_{x'}\mathbf{i}' + \bar{I}_{y'}\omega_{y'}\mathbf{j} + I_{z'}\omega_{z'}\mathbf{k}$$

$$= (0.020704)(8)\mathbf{i} + (0.041408)(16)\mathbf{j}$$

$$= (0.1656 \text{ lb}\cdot\text{s}\cdot\text{ft})\mathbf{i} + (0.6625 \text{ lb}\cdot\text{s}\cdot\text{ft})\mathbf{j}$$

Let the frame of reference *Axyz* be rotating with angular velocity

$$\boldsymbol{\Omega} = \omega_2\mathbf{i} = (8 \text{ rad/s})\mathbf{i}$$

Then

$$\dot{\mathbf{H}}_A = (\dot{\mathbf{H}}_A)_{Axyz} + \boldsymbol{\Omega}\times\mathbf{H}_A = 0 + \omega_2\mathbf{i}\times\mathbf{H}_A$$

$$\dot{\mathbf{H}}_A = 8\mathbf{i}\times(0.1656\mathbf{i} + 0.6625\mathbf{j}) = (5.30 \text{ lb}\cdot\text{ft})\mathbf{k}$$

$\dot{\mathbf{H}}_A = (5.30 \text{ lb}\cdot\text{ft})\mathbf{k}$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 18.59

Determine the rate of change $\dot{\mathbf{H}}_C$ of the angular momentum $\mathbf{H}_C$ of the disk of Problem 18.5.

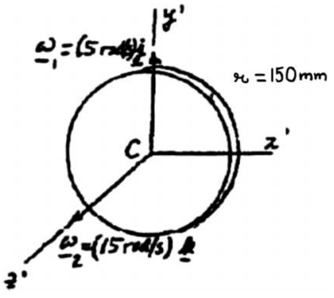
PROBLEM 18.5 A thin disk of mass $m = 4$ kg rotates at the constant rate $\omega_2 = 15$ rad/s with respect to arm *ABC*, which itself rotates at the constant rate $\omega_1 = 5$ rad/s about the *y* axis. Determine the angular momentum of the disk about its center *C*.

SOLUTION

$$r = 150 \text{ mm}$$

Angular velocity of disk:

$$\boldsymbol{\omega} = \omega_1 \mathbf{j} + \omega_2 \mathbf{k}$$
$$= (5 \text{ rad/s})\mathbf{j} + (15 \text{ rad/s})\mathbf{k}$$



Centroidal moments of inertia:

$$\bar{I}_{x'} = \bar{I}_{y'} = \frac{1}{4}mr^2$$
$$= \frac{1}{4}(4)(0.150 \text{ m})^2 = 0.0225 \text{ kg} \cdot \text{m}^2$$
$$\bar{I}_{z'} = \frac{1}{2}mr^2 = 0.045 \text{ kg} \cdot \text{m}^2$$

Angular momentum about *C*.

$$\mathbf{H}_C = \bar{I}_{x'}\,\omega_{x'}\mathbf{i} + \bar{I}_{y'}\,\omega_{y'}\mathbf{j} + I_{z'}\,\omega_{z'}\mathbf{k}$$
$$= 0 + (0.0225)(5)\mathbf{j} + (0.045)(15)\mathbf{k}$$
$$= (0.1125 \text{ kg} \cdot \text{m}^2/\text{s})\mathbf{j} + (0.6750 \text{ kg} \cdot \text{m}^2/\text{s})\mathbf{k}$$

Rate of change of angular momentum. Let the reference frame *Oxyz* be rotating with angular velocity.

$$\boldsymbol{\Omega} = \boldsymbol{\omega}_1 = (5 \text{ rad/s})\mathbf{j}$$

Then

$$\dot{\mathbf{H}}_C = (\dot{\mathbf{H}}_C)_{Oxyz} + \boldsymbol{\Omega} \times \mathbf{H}_C$$
$$= 0 + 5\mathbf{j} \times (0.1125\mathbf{j} + 0.6750\mathbf{k})$$
$$= (3.3750 \text{ N} \cdot \text{m})\mathbf{i}$$

$$\dot{\mathbf{H}}_C = (3.38 \text{ N} \cdot \text{m})\mathbf{i} \blacktriangleleft$$

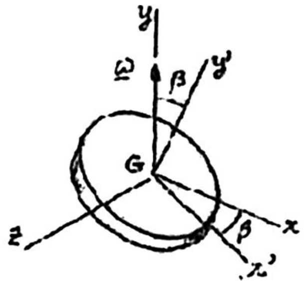
PROBLEM 18.60

Determine the rate of change $\dot{\mathbf{H}}_G$ of the angular momentum $\mathbf{H}_G$ of the disk of Problem 18.8.

PROBLEM 18.8 A homogeneous disk of mass *m* and radius *r* is mounted on the vertical shaft *AB*. The normal to the disk at *G* forms an angle $\beta = 25°$ with the shaft. Knowing that the shaft has a constant angular velocity ω, determine the angle θ formed by the shaft *AB* and the angular momentum $\mathbf{H}_G$ of the disk about its mass center *G*.

SOLUTION

Use the principal centroidal axes $Gx'y'z'$,



Moments of inertia.

$$\bar{I}_{x'} = \bar{I}_z = \frac{1}{4}mr^2$$

$$\bar{I}_{y'} = \frac{1}{2}mr^2$$

Angular velocity.

$$\omega_{x'} = -\omega \sin\beta$$

$$\omega_{y'} = \omega \cos\beta$$

$$\omega_z = 0$$

Angular momentum about *G*.

Using Eqs. (18.10),

$$H_{x'} = \bar{I}_{x'}\omega_{x'} = -\frac{1}{4}mr^2\omega \sin\beta$$

$$H_{y'} = \bar{I}_{y'}\omega_{y'} = \frac{1}{2}mr^2\omega \cos\beta$$

$$H_z = \bar{I}_z\omega_z = 0$$

$$\mathbf{H}_G = H_{x'}\mathbf{i}' + H_{y'}\mathbf{j}' + H_z\mathbf{k}$$

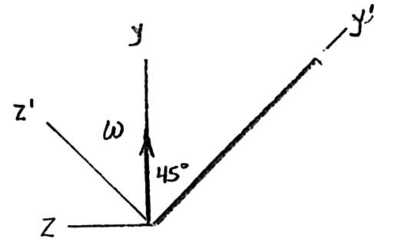
PROBLEM 18.63

A thin homogeneous square of mass *m* and side *a* is welded to a vertical shaft *AB* with which it forms an angle of 45°. Knowing that the shaft rotates with an angular velocity $\boldsymbol{\omega} = \omega\mathbf{j}$ and an angular acceleration $\boldsymbol{\alpha} = \alpha\mathbf{j}$, determine the rate of change $\dot{\mathbf{H}}_A$ of the angular momentum $\mathbf{H}_A$ of the plate assembly.

SOLUTION

Use principal axes y', z' as shown.



$$\omega_{y'} = \omega\cos 45°, \quad \omega_{z'} = \omega\sin 45°$$

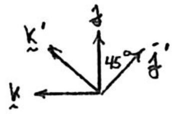
$$\omega_{x'} = 0$$

$$I_{x'} = \frac{1}{3}ma^2, \quad I_{y'} = \frac{1}{12}ma^2$$

$$I_{z'} = I_{x'} + I_{y'} = \frac{5}{12}ma^2$$

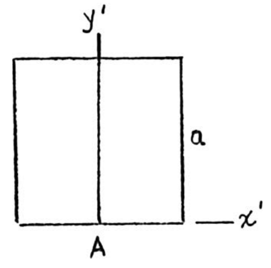
$$\mathbf{H}_A = I_{x'}\omega_{x'}\mathbf{i}' + I_{y'}\omega_{y'}\mathbf{j}' + I_{z'}\omega_{z'}\mathbf{k}'$$

$$= 0 + \left(\frac{1}{12}ma^2\right)(\omega\cos 45°)\mathbf{j}' + \left(\frac{5}{12}ma^2\right)(\omega\sin 45°)\mathbf{k}'$$



$$\mathbf{H}_A = \left(\frac{1}{12}ma^2\right)(\omega\cos 45°)(\cos 45°\mathbf{j} - \sin 45°\mathbf{k})$$

$$+ \left(\frac{5}{12}ma^2\right)(\omega\sin 45°)(\sin 45°\mathbf{j} + \cos 45°\mathbf{k})$$



$$\mathbf{H}_A = \frac{ma^2\omega}{12}(3\mathbf{j} + 2\mathbf{k})$$

Angular acceleration. $\quad \boldsymbol{\alpha} = \alpha\mathbf{j}; \quad \dot{\omega}_{y'} = \alpha\cos 45°, \quad \dot{\omega}_{z'} = \alpha\sin 45°$

Let the reference frame *Axyz* be rotating with angular velocity

$$\boldsymbol{\Omega} = \omega\mathbf{j}$$

With respect to this frame,

$$(\dot{\mathbf{H}}_A)_{Axyz} = I_{x'}\dot{\omega}_{x'}\mathbf{i}' + I_{y'}\dot{\omega}_{y'}\mathbf{j}' + I_{z'}\dot{\omega}_{z}\mathbf{k}'$$

$$= 0 + \left(\frac{1}{12}ma^2\right)(\alpha\cos 45°)\mathbf{i}' + \left(\frac{5}{12}ma^2\right)(\alpha\sin 45°)\mathbf{k}'$$

$$= \frac{ma^2\alpha}{12}(3\mathbf{j} + 2\mathbf{k})$$

If you are a student using this Manual, you are using it without permission.*

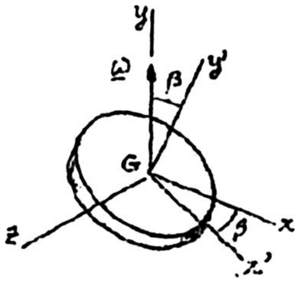
PROBLEM 18.64

Determine the rate of change $\dot{\mathbf{H}}_G$ of the angular momentum $\mathbf{H}_G$ of the disk of Problem 18.8, assuming that at the instant considered the assembly has an angular velocity $\boldsymbol{\omega} = \omega\mathbf{j}$ and an angular acceleration $\boldsymbol{\alpha} = \alpha\mathbf{j}$.

PROBLEM 18.8 A homogeneous disk of mass m and radius r is mounted on the vertical shaft AB. The normal to the disk at G forms an angle $\beta = 25°$ with the shaft. Knowing that the shaft has a constant angular velocity ω, determine the angle θ formed by the shaft AB and the angular momentum $\mathbf{H}_G$ of the disk about its mass center G.

SOLUTION

Use the principal centroidal axes $Gx'y'z'$



Moments of inertia.

$$\bar{I}_{x'} = \bar{I}_{z'} = \frac{1}{4}mr^2$$

$$\bar{I}_{y'} = \frac{1}{2}mr^2$$

Angular velocity.

$$\omega_{x'} = -\omega \sin\beta$$

$$\omega_{y'} = \omega\cos\beta$$

$$\omega_z = 0$$

Angular momentum about G.

Using Eqs. (18.10),

$$H_{x'} = \bar{I}_{x'}\omega_{x'} = -\frac{1}{4}mr^2\omega\sin\beta$$

$$H_{y'} = \bar{I}_{y'}\omega_{y'} = \frac{1}{2}mr^2\omega\cos\beta$$

$$H_z = \bar{I}_z\omega_z = 0$$

$$\mathbf{H}_G = H_{x'}\mathbf{i}' + H_{y'}\mathbf{j} + H_z\mathbf{k}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 18.64 (Continued)

where $\mathbf{i}, \mathbf{j}, \mathbf{k}$ are the unit vectors along the x', y', z' axes.

$$\mathbf{H}_G = -\frac{1}{4}mr^2\omega\sin\beta\mathbf{i}' + \frac{1}{2}mr^2\omega\cos\beta\mathbf{j}'$$

Angular acceleration. $\boldsymbol{\alpha} = \alpha\mathbf{j}, \quad \dot{\omega}_{x'} = -\alpha\sin\beta, \quad \dot{\omega}_{y'} = \alpha\cos\beta, \quad \dot{\omega}_{z'} = 0$

Rate of change of angular momentum. Let the reference frame $Gxyz$ be rotating with angular velocity

$$\boldsymbol{\Omega} = \omega\mathbf{j} = -(\omega\sin\beta)\mathbf{i}' + (\omega\cos\beta)\mathbf{j}'$$

With respect to this frame,

$$\begin{aligned}
(\dot{\mathbf{H}}_G)_{Gxyz} &= \bar{I}_{x'}\dot{\omega}_{x'}\mathbf{i}' + \bar{I}_{y'}\dot{\omega}_{y'}\mathbf{j}' + \bar{I}_{z'}\dot{\omega}_{z'}\mathbf{k}' \\
&= \left(\frac{1}{4}mr^2\right)(-\alpha\sin\beta)\mathbf{i}' + \left(\frac{1}{2}mr^2\right)(\alpha\cos\beta)\mathbf{j}' + 0 \\
&= -\frac{1}{4}mr^2\alpha\sin\beta\mathbf{i}' + \frac{1}{2}mr^2\alpha\cos\beta\mathbf{j}' \\
&= -\frac{1}{4}mr^2\alpha\sin\beta(\mathbf{i}\cos\beta - \mathbf{j}\sin\beta) + \frac{1}{2}mr^2\alpha\cos\beta(\mathbf{i}\sin\beta + \mathbf{j}\cos\beta) \\
&= \frac{1}{4}mr^2\alpha[\mathbf{i}\sin\beta\cos\beta + \mathbf{j}(2\cos^2\beta + \sin^2\beta)] \\
&= \frac{1}{4}mr^2\alpha[\mathbf{i}\sin 25^\circ\cos 25^\circ + \mathbf{j}(2\cos^2 25^\circ + \sin^2 25^\circ)] \\
&= mr^2\alpha(0.0957556\mathbf{i} + 0.45535\mathbf{j})
\end{aligned}$$

With respect to the fixed reference frame,

$$\dot{\mathbf{H}}_G = (\dot{\mathbf{H}}_G)_{Gxyz} + \boldsymbol{\Omega}\times\mathbf{H}_G \quad \text{where}$$

$$\begin{aligned}
\boldsymbol{\Omega}\times\mathbf{H}_G &= +(-\omega\sin\beta\mathbf{i}' + \omega\cos\beta\mathbf{j}') \\
&\quad \times\left(-\frac{1}{4}mr^2\omega\sin\beta + \frac{1}{2}mr^2\omega\cos\beta\right) \\
&= \frac{1}{4}mr^2\omega^2\cos\beta\sin\beta\mathbf{k} - \frac{1}{2}mr^2\omega^2\sin\beta\cos\beta\mathbf{k} \\
&= -\frac{1}{4}mr^2\omega^2\sin\beta\cos\beta\mathbf{k} \\
&= -\frac{1}{4}mr^2\omega^2\sin 25^\circ\cos 25^\circ\mathbf{k} = -0.095756mr^2\omega^2\mathbf{k}
\end{aligned}$$

Then $\quad \dot{\mathbf{H}}_G = mr^2(0.0958\alpha\mathbf{i} + 0.455\alpha\mathbf{j} - 0.0958\omega^2\mathbf{k})$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 18.65

A slender, uniform rod AB of mass m and a vertical shaft CD, each of length $2b$, are welded together at their midpoints G. Knowing that the shaft rotates at the constant rate ω, determine the dynamic reactions at C and D.

SOLUTION

Using the principal axes $Gx'y'z$:

$$\bar{I}_{x'} = 0, \quad \bar{I}_{y'} = \bar{I}_z = \frac{1}{3}mb^2$$

$$\omega_{x'} = -\omega \sin\beta, \quad \omega_{y'} = \omega\cos\beta, \quad \omega_z = 0$$

Angular momentum about G. $\quad \mathbf{H}_G = \bar{I}_{x'}\omega_{x'}\mathbf{i}' + \bar{I}_{y'}\omega_{y'}\mathbf{j}' + \bar{I}_z\omega_z\mathbf{k}$

$$\mathbf{H}_G = \frac{1}{3}mb^2\omega\cos\beta\,\mathbf{j}'$$

or, since $\mathbf{j}' = \mathbf{i}\sin\beta + \mathbf{j}\cos\beta$: $\quad \mathbf{H}_G = \frac{1}{3}mb^2\omega\cos\beta(\sin\beta\,\mathbf{i} + \cos\beta\,\mathbf{j}) \qquad (1)$

Rate of change of angular momentum.

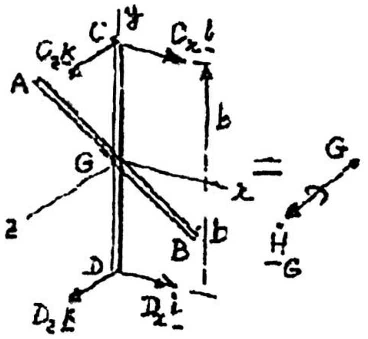
$$\dot{\mathbf{H}}_G = (\dot{\mathbf{H}}_G)_{Gxyz} + \mathbf{\Omega}\times\mathbf{H}_G = 0 + \boldsymbol{\omega}\times\mathbf{H}_B$$

$$= \omega\mathbf{j}\times\left[\frac{1}{3}mb^2\omega\cos\beta(\sin\beta\,\mathbf{i} + \cos\beta\,\mathbf{j})\right]$$

$$= -\frac{1}{3}mb^2\omega^2\sin\beta\cos\beta\,\mathbf{k}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. If you are a student using this Manual, you are using it without permission.*

PROBLEM 18.65 (Continued)



Equations of motion.

We equate the systems of external and effective forces

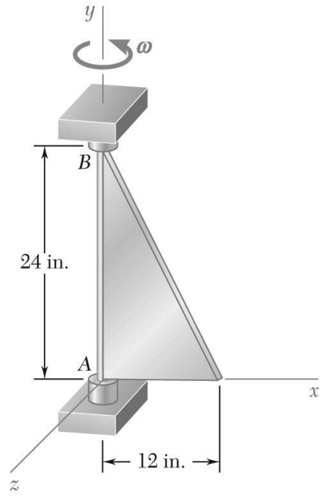
$$\Sigma \mathbf{M}_D = \Sigma(\mathbf{M}_D)_{\text{eff}}: \quad 2b\mathbf{j} \times (C_x\mathbf{i} + C_z\mathbf{k}) = \dot{\mathbf{H}}_G$$

$$-2bC_x\mathbf{k} + 2bC_z\mathbf{i} = -\frac{1}{3}mb^2\omega^2 \sin\beta\cos\beta\,\mathbf{k}$$

Thus, $\quad C_x = \dfrac{1}{6}mb\omega^2 \sin\beta\cos\beta, \quad C_z = 0$ $\qquad \mathbf{C} = \dfrac{1}{6}mb\omega^2 \sin\beta\cos\beta\,\mathbf{i}$ ◀

$\Sigma\mathbf{F} = \Sigma\mathbf{F}_{\text{eff}}: \quad \mathbf{C} + \mathbf{D} = 0$ $\qquad \mathbf{D} = -\dfrac{1}{6}mb\omega^2 \sin\beta\cos\beta\,\mathbf{i}$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



PROBLEM 18.66

A thin homogeneous triangular plate of weight 10 pounds is welded to a light vertical axle supported by bearings at *A* and *B*. Knowing that the plate rotates at the constant rate $\omega = 8$ rad/s, determine the dynamic reactions at *A* and *B*.

SOLUTION

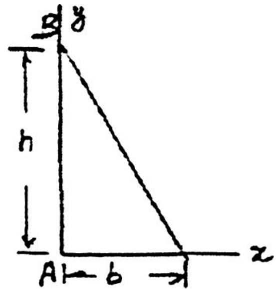
We shall use Eqs. (18.1) and (18.28):

$$\Sigma \mathbf{F} = m\bar{\mathbf{a}} \quad \Sigma \mathbf{M}_A = (\dot{\mathbf{H}}_A)_{Axyz} + \mathbf{\Omega} \times \mathbf{H}_A$$

Computation of $\mathbf{H}_A$:

$$\boldsymbol{\omega} = \omega \mathbf{j}$$

$$\mathbf{H}_A = -I_{xy}\omega \mathbf{i} + I_y \omega \mathbf{j} - I_{yz}\omega \mathbf{k}$$



The moment of inertia of the triangle is

$$(I_y)_{\text{area}} = \frac{1}{12}b^3 h, \quad A = \frac{1}{2}bh$$

$$(I_y)_{\text{mass}} = \frac{m}{A}(I_y)_{\text{area}} = \frac{1}{6}mb^2$$

The product of inertia of the triangle is

$$(I_{xy})_{\text{area}} = \frac{1}{24}b^2 h^2$$

$$(I_{xy})_{\text{mass}} = \frac{m}{A}(I_{xy})_{\text{area}} = \frac{1}{12}mbh$$

Since the *z*-coordinate is negligible,

$$(I_{yz})_{\text{mass}} = 0$$

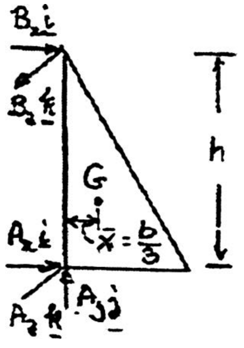
Thus, $$\mathbf{H}_A = -\frac{1}{12}mbh\omega \mathbf{i} + \frac{1}{6}mb^2 \omega \mathbf{j}. \quad (1)$$

where the frame of reference *Axyz* rotates with the plate with the angular velocity

$$\mathbf{\Omega} = \boldsymbol{\omega} = \omega \mathbf{j}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 18.66 (Continued)



Equations of motion. (Weight is omitted for dynamic reactions.)

Eq. (18.28),

$$\Sigma\mathbf{M}_A = (\dot{\mathbf{H}}_A)_{Axyz} + \mathbf{\Omega}\times\mathbf{H}_A.$$

Since $\omega = \text{constant}$, it follows from Eq. (1) that

$$(\dot{\mathbf{H}}_A)_{Axyz} = 0$$

Thus,

$$h\mathbf{j}\times(B_x\mathbf{i} + B_z\mathbf{k}) = 0 + \omega\mathbf{j}\times\left(-\frac{mbh}{12}\omega\mathbf{i} + \frac{mb^2}{6}\omega\mathbf{j}\right) - hB_x\mathbf{k} + h\mathbf{B}_z\mathbf{i}$$

$$= +\frac{1}{12}mbh\omega^2\mathbf{k}$$

Equating coefficients of unit vectors: $B_x = -\frac{1}{12}mb\omega^2, \quad B_z = 0$

$$\mathbf{B} = -\frac{1}{12}mb\omega^2\mathbf{i}$$

The dynamic reactions must also satisfy Eq. (18.1):

$$\Sigma\mathbf{F} = m\bar{\mathbf{a}}: \quad \mathbf{A} + \mathbf{B} = -m\bar{x}\omega^2\mathbf{i} = -m\left(\frac{b}{3}\right)\omega^2\mathbf{i}$$

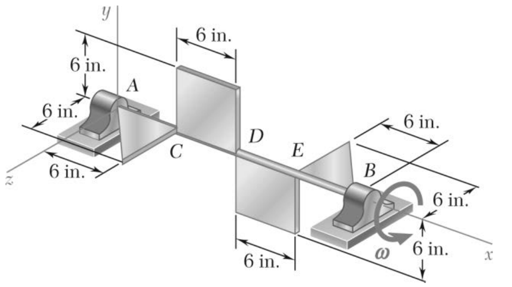
$$\mathbf{A} = -\frac{1}{3}mb\omega^2\mathbf{i} - \left(-\frac{1}{12}mb\omega^2\mathbf{i}\right), \quad \mathbf{A} = -\frac{1}{4}mb\omega^2\mathbf{i}$$

Given data: $W = 10$ lb, $b = 12$ in. $= 1$ ft, $h = 24$ in. $= 2$ ft, $\omega = 8$ rad/s

$$\mathbf{A} = -\frac{1}{4}\left(\frac{10\text{ lbs}}{32.2}\right)(1\text{ ft})(8\text{ rad/s})^2\mathbf{i}$$ $\mathbf{A} = -(4.97\text{ lb})\mathbf{i}$ ◀

$$\mathbf{B} = -\frac{1}{12}\left(\frac{10\text{ lbs}}{32.2}\right)(1\text{ ft})(8\text{ rad/s})^2\mathbf{i}$$ $\mathbf{B} = -(1.656\text{ lb})\mathbf{i}$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



PROBLEM 18.67

The assembly shown consists of pieces of sheet aluminum of uniform thickness and of total weight 2.7 lb welded to a light axle supported by bearings at *A* and *B*. Knowing that the assembly rotates at the constant rate $\omega = 240\,\text{rpm}$, determine the dynamic reactions at *A* and *B*.

SOLUTION

Mass of sheet metal: $m = \dfrac{2.7}{32.2} = 0.08385\ \text{lb}\cdot\text{s}^2/\text{ft}$

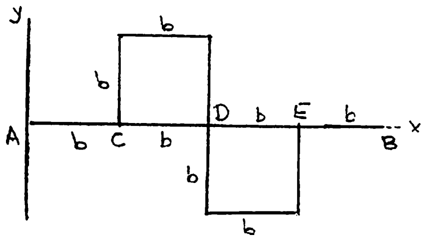
Sheet metal dimension: $b = 6\ \text{in.} = 0.5\ \text{ft}$

Area of sheet metal: $A = \dfrac{1}{2}b^2 + b^2 + b^2 + \dfrac{1}{2}b^2 = 3b^2 = 0.75\ \text{ft}^2$

Let $\rho = \dfrac{m}{A} = \dfrac{0.08385}{0.75} = 0.1118\ \text{lb}\cdot\text{s}^2/\text{ft}^3 = \text{mass per unit area.}$

Moments and products of inertia: $I_{\text{mass}} = \rho I_{\text{area}}$

xy plane (rectangles)



$$I_x = \frac{1}{3}b^4 + \frac{1}{3}b^4 = \frac{2}{3}b^4$$

$$I_x = \frac{2}{3}\rho b^4$$

$$= \frac{2}{3}(0.1118)(0.5)^4$$

$$= 4.658\times10^{-3}\ \text{lb}\cdot\text{s}^2\cdot\text{ft}$$

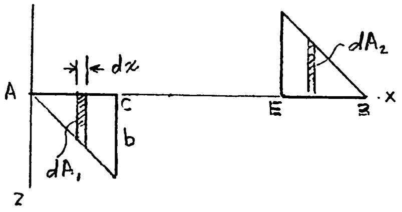
$$I_{xy} = (b^2)\left(\frac{3}{2}b\right)\left(\frac{1}{2}b\right) + (b^2)\left(\frac{5}{2}b\right)\left(-\frac{1}{2}b\right)$$

$$= -\frac{1}{2}b^4$$

$$I_{xy} = -\frac{1}{2}\rho b^4 = -\frac{1}{2}(0.1118)(0.5)^4$$

$$= -3.4938\times10^{-3}\ \text{lb}\cdot\text{s}^2\cdot\text{ft}$$

xz plane (triangles)



$$I_x = \frac{1}{12}b^4 + \frac{1}{12}b^4 = \frac{1}{6}b^4$$

$$I_x = \frac{1}{6}\rho b^4 = \frac{1}{6}(0.1118)(0.5)^4$$

$$= 1.1646\times10^{-3}\ \text{lb}\cdot\text{s}^2\cdot\text{ft}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

For calculation of I_{xz}, use pairs of elements dA_1 and dA_2:

$$dA_2 = dA_1.$$

$$I_{xz} = \int x\frac{z}{2}dA_1 + \int(4b-x)\left(-\frac{z}{2}\right)dA_2 = -\int(2b-x)z\,dA_1 = -\int_0^b (2b-x)z^2 dx$$

but $\quad z = x.$

Hence, $\quad I_{xz} = -\int_0^a (2bx^2 - x^3)dx = -\left(\frac{2}{3}b^4 - \frac{1}{4}b^4\right) = -\frac{5}{12}b^4$

$$I_{xz} = -\frac{5}{12}\rho b^4 = -\frac{5}{12}(0.1118)(0.5)^4 = -2.9115\times10^{-3}\ \text{lb}\cdot\text{s}^2\cdot\text{ft}$$

Total for I_x: $\quad I_x = 4.658\times10^{-3} + 1.1646\times10^{-3} = 5.823\times10^{-3}\ \text{lb}\cdot\text{s}^2\cdot\text{ft}$

The mass center lies on the rotation axis, therefore

$$\bar{\mathbf{a}} = 0$$

$$\Sigma\mathbf{F} = \mathbf{A} + \mathbf{B} = m\bar{\mathbf{a}} = 0 \quad \mathbf{A} = -\mathbf{B}$$

$$\mathbf{H}_A = I_x\omega\mathbf{i} - I_{xy}\omega\mathbf{j} - I_{xz}\omega\mathbf{k} \quad \boldsymbol{\omega} = \omega\mathbf{i}, \quad \boldsymbol{\alpha} = \alpha\mathbf{i}$$

Let the frame of reference $Axyz$ be rotating with angular velocity

$$\boldsymbol{\Omega} = \boldsymbol{\omega} = \omega\mathbf{i}$$

$$\Sigma\mathbf{M}_A = \dot{\mathbf{H}}_A = (\dot{\mathbf{H}}_A)_{Axyz} + \boldsymbol{\Omega}\times\mathbf{H}_A$$

$$M_0\mathbf{i} + 4b\mathbf{i}\times(B_y\mathbf{j} + B_z\mathbf{k}) = I_x\alpha\mathbf{i} - I_{xy}\alpha\mathbf{j} - I_{xz}\alpha\mathbf{k} + \omega\mathbf{i}\times(I_x\omega\mathbf{i} - I_{xy}\omega\mathbf{j} - I_{xz}\omega\mathbf{k})$$

$$M_0\mathbf{i} - 4bB_z\mathbf{j} + 4bB_y\mathbf{k} = I_x\alpha\mathbf{i} - (I_{xy}\alpha - I_{xz}\omega^2)\mathbf{j} - (I_{xz}\alpha + I_{xy}\omega^2)\mathbf{k}$$

Resolve into components and solve for B_y and B_z.

$\mathbf{i}$: $\quad M_0 = I_x\alpha$

$\mathbf{j}$: $\quad B_z = \dfrac{(I_{xy}\alpha - I_{xz}\omega^2)}{4b}$

$\mathbf{k}$: $\quad B_y = -\dfrac{(I_{xz}\alpha + I_{xy}\omega^2)}{4b}$

<u>Data</u>: $\quad \alpha = 0, \quad \omega = \dfrac{2\pi(240)}{60} = 25.133\ \text{rad/s}, \quad b = 0.5\ \text{ft} \quad M_0 = 0$

$$B_z = \frac{0 - (-2.9115\times10^{-3})(25.133)^2}{(4)(0.5)} = 0.91955\ \text{lb.}$$

PROBLEM 18.68

The 8-kg shaft shown has a uniform cross section. Knowing that the shaft rotates at the constant rate $\omega = 12$ rad/s, determine the dynamic reactions at A and B.

SOLUTION

Angular velocity: $\boldsymbol{\omega} = \omega \mathbf{i}$

Angular momentum about the mass center G:

$$\mathbf{H}_G = \bar{I}_x \omega \mathbf{i} - \bar{I}_{xy} \omega \mathbf{j} - \bar{I}_{xz} \omega \mathbf{k}$$

Let the reference frame $Axyz$ be rotating with angular velocity

$$\boldsymbol{\Omega} = \omega \mathbf{i}.$$

$$\dot{\mathbf{H}}_G = (\dot{\mathbf{H}}_G)_{Axyz} + \boldsymbol{\Omega} \times \mathbf{H}_G$$

$$= 0 + \omega \mathbf{i} \times (\bar{I}_x \omega \mathbf{i} - \bar{I}_{xy} \omega \mathbf{j} - \bar{I}_{xz} \omega \mathbf{k})$$

$$= \bar{I}_{xz} \omega^2 \mathbf{j} - \bar{I}_{xy} \omega^2 \mathbf{k}$$

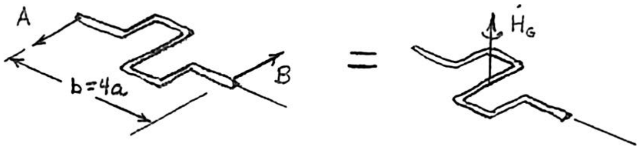
Since the shaft lies in the xz plane, $\bar{I}_{xy} = 0$.

By symmetry, the mass center lies on line AB.

$$m\bar{\mathbf{a}} = 0$$

$$\Sigma \mathbf{F} = \Sigma F_{\text{eff}}: \quad \mathbf{A} + \mathbf{B} = m\bar{\mathbf{a}} = 0 \quad \mathbf{A} \text{ and } \mathbf{B} \text{ form a couple.}$$

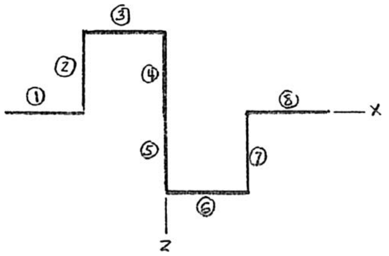
$$\mathbf{A} = -\mathbf{B}$$



$$b\mathbf{i} \times (B_y \mathbf{j} + B_z \mathbf{k}) = \dot{\mathbf{H}}_G$$

$$-bB_z \mathbf{j} + bB_y \mathbf{k} = \bar{I}_{xz} \omega \mathbf{j} \quad B_z = -\frac{\bar{I}_{xz} \omega^2}{b}, \quad B_y = 0$$

Calculation of $\bar{I}_{xz}$.



Divide the shaft into eight segments, each of length

$$a = 200 \text{ mm} = 0.2 \text{ m}$$

Let m' be the mass of one segment.

$$m' = \frac{8 \text{ kg}}{8} = 1 \text{ kg}$$

For (1), (4), (5), and (8), $I_{xz} = 0$

PROBLEM 18.69

After attaching the 18-kg wheel shown to a balancing machine and making it spin at the rate of 15 rev/s, a mechanic has found that to balance the wheel both statically and dynamically, he should use two corrective masses, a 170-g mass placed at *B* and a 56-g mass placed at *D*. Using a right-handed frame of reference rotating with the wheel (with the *z* axis perpendicular to the plane of the figure), determine before the corrective masses have been attached (*a*) the distance from the axis of rotation to the mass center of the wheel and the products of inertia I_{xy} and I_{zx}, (*b*) the force-couple system at *C* equivalent to the forces exerted by the wheel on the machine.

SOLUTION

$$m = 18 \text{ kg}, \quad \boldsymbol{\omega} = 2\pi(15)\mathbf{i} = (94.248 \text{ rad/s})\mathbf{i}$$

$$m_B = 170 \text{ g} = 0.17 \text{ kg}$$

$$m_D = 56 \text{ g} = 0.056 \text{ kg}$$

$$x_B = 75 \text{ mm} = 0.075 \text{ m}, \quad y_B = 182 \text{ mm} = 0.182 \text{ m}$$

$$x_D = -0.075 \text{ m}, \quad y_D = -0.182 \text{ m}$$

(*a*) Balance masses are added to move the mass center to Point *C* and to reduce the products of inertia to zero.

$$m_B y_B + m_D y_D + m\bar{y} = 0$$

$$(0.17)(0.182) + (0.056)(-0.182) + 18\bar{y} = 0$$

$$\bar{y} = -1.15267 \times 10^{-3} \text{ m} \qquad \bar{y} = -1.153 \text{ mm} \blacktriangleleft$$

$$\bar{z} = 0 \qquad \bar{z} = 0 \blacktriangleleft$$

$$m_B x_B y_B + m_D x_D y_D + I_{xy} = 0$$

$$(0.17)(0.075)(0.182) + (0.056)(-0.075)(-0.182) + I_{xy} = 0$$

$$I_{xy} = -3.0848 \times 10^{-3} \qquad I_{xy} = -3.08 \times 10^{-3} \text{ kg} \cdot \text{m}^2 \blacktriangleleft$$

$$I_{zx} = 0 \blacktriangleleft$$

If you are a student using this Manual, you are using it without permission.*

PROBLEM 18.70

When the 18-kg wheel shown is attached to a balancing machine and made to spin at a rate of 12.5 rev/s, it is found that the forces exerted by the wheel on the machine are equivalent to a force-couple system consisting of a force $\mathbf{F} = (160\text{ N})\mathbf{j}$ applied at C and a couple $\mathbf{M}_C = (14.7\text{ N}\cdot\text{m})\mathbf{k}$, where the unit vectors form a triad which rotates with the wheel. (*a*) Determine the distance from the axis of rotation to the mass center of the wheel and the products of inertia I_{xy} and I_{zx}. (*b*) If only two corrective masses are to be used to balance the wheel statically and dynamically, what should these masses be and at which of the Points A, B, D, or E should they be placed?

SOLUTION

$$m = 18\text{ kg},\quad \omega = 2\pi(12.5)\mathbf{i} = (78.54\text{ rad/s})\mathbf{i}$$

(*a*) The force-couple system acting on the wheel is

$$\mathbf{F}' = -(160\text{ N})\mathbf{j},\quad \mathbf{M}'_C = -(14.7\text{ N}\cdot\text{m})\mathbf{k}$$

$$\mathbf{F}' = m\bar{\mathbf{a}}_n = -m\bar{\mathbf{r}}\omega^2 \qquad \bar{\mathbf{r}} = \bar{y}\mathbf{j} + \bar{z}\mathbf{k} = \frac{-\mathbf{F}'}{m\omega^2}$$

$$\bar{y} = \frac{-F'_y}{m\omega^2} = \frac{160}{(18)(78.54)^2} = 1.441\times 10^{-3}\text{ m} \qquad \bar{y} = 1.441\text{ mm}$$

$$\bar{z} = \frac{-F'_z}{m\omega^2} = 0 \qquad \bar{r} = 1.441\text{ mm} \blacktriangleleft$$

$$\mathbf{H}_C = I_x\omega\mathbf{i} - I_{xy}\omega\mathbf{j} - I_{xz}\omega\mathbf{k}$$

$$\mathbf{M}'_C = \dot{\mathbf{H}}_C = \boldsymbol{\omega}\times\mathbf{H}_C = \omega\mathbf{i}\times(I_x\omega\mathbf{i} - I_{xy}\omega\mathbf{j} - I_{xz}\omega\mathbf{k})$$

$$(M'_C)_y\,\mathbf{j} + (M'_C)_z\,\mathbf{k} = I_{xz}\omega^2\mathbf{j} - I_{xy}\omega^2\mathbf{k}$$

$$I_{xy} = -\frac{(M'_C)_z}{\omega^2} = \frac{-(-14.7)}{(78.54)^2} = 2.3831\times 10^{-3}\text{ kg}\cdot\text{m}^2$$

$$I_{xy} = 2.38\times 10^{-3}\text{ kg}\cdot\text{m}^2 \blacktriangleleft$$

$$I_{xz} = \frac{(M'_C)_y}{\omega^2} = 0 \qquad I_{xz} = 0 \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

(*b*) Positions for the balance masses.

$$y_A = y_B = -y_E = -y_D = 182 \text{ mm} = 0.182 \text{ m}$$

$$-x_A = x_B = x_E = -x_D = 75 \text{ mm} = 0.075 \text{ m}$$

Balance masses must be added to move the mass center to Point *C* and to reduce the product of inertia to zero.

$$m_A y_A + m_B y_B + m_E y_E + m_D y_D + m\bar{y} = 0$$

$$(0.182)(m_A + m_B - m_E - m_D) + (18)(1.441\times 10^{-3})$$

$$m_A + m_B - m_E - m_D = -0.1425 \text{ kg} \qquad (1)$$

$$m_A x_A y_A + m_B x_B y_B + m_E x_E y_E + m_D x_D y_D + I_{xy} = 0$$

$$(0.075)(0.182)(-m_A + m_B - m_E + m_D) + 2.3831\times 10^{-3} = 0$$

$$-m_A + m_B - m_E + m_D = -0.17459 \text{ kg} \qquad (2)$$

To solve Eqs. (1) and (2), set $m_B = 0$ and let $m_{AD} = m_A - m_D$.

Then $\quad m_{AD} - m_E = -0.1425$

and $\quad -m_{AD} - m_E = -0.17459$

Solving, $\quad m_{AD} = 0.01605 \text{ kg}, \quad m_E = 0.1585 \text{ kg}$

Set $m_D = 0,$ so that $m_A = 0.01605 \text{ kg}$ $\qquad m_E = 158.5 \text{ g}$ ◀

$m_A = 16.05 \text{ g}$ ◀

PROBLEM 18.71

Knowing that the assembly of Problem 18.65 is initially at rest $(\omega = 0)$ when a couple of moment $\mathbf{M}_0 = \mathbf{M}_0\mathbf{j}$ is applied to shaft *CD*, determine (*a*) the resulting angular acceleration of the assembly, (*b*) the dynamic reactions at *C* and *D* immediately after the couple is applied.

SOLUTION

Using the principal axes $Gx'y'z$:

$$\bar{I}_{x'} = 0, \quad \bar{I}_{y'} = \bar{I}_z = \frac{1}{3}mb^2$$

$$\omega_{x'} = -\omega \sin\beta, \quad \omega_{y'} = \omega\cos\beta, \quad \omega_z = 0$$

Angular momentum about *G*.

$$\mathbf{H}_G = \bar{I}_{x'}\omega_{x'}\mathbf{i}' + \bar{I}_{y'}\omega_{y'}\mathbf{j}' + I_z\omega_z\mathbf{k}$$

$$\mathbf{H}_G = \frac{1}{3}mb^2\omega\cos\beta\mathbf{j}'$$

or, since $\mathbf{j}' = \mathbf{i}\sin\beta + \mathbf{j}\cos\beta$: $\quad \mathbf{H}_G = \frac{1}{3}mb^2\omega\cos\beta(\sin\beta\mathbf{i} + \cos\beta\mathbf{j}) \qquad (1)$

Rate of change of angular momentum.

Eq. (18.22): $\quad \dot{\mathbf{H}}_G = (\dot{\mathbf{H}}_G)_{Gxyz} + \mathbf{\Omega}\times\mathbf{H}_G = (\dot{\mathbf{H}}_G)_{Gxyz} + 0$

Since $\mathbf{\Omega} = \boldsymbol{\omega} = 0$ when couple is applied, thus,

$$\dot{\mathbf{H}}_G = (\dot{\mathbf{H}}_G)_{Gxyz} = \frac{1}{3}mb^2\alpha\cos\beta(\sin\beta\mathbf{i} + \cos\beta\mathbf{j}) \qquad (2)$$

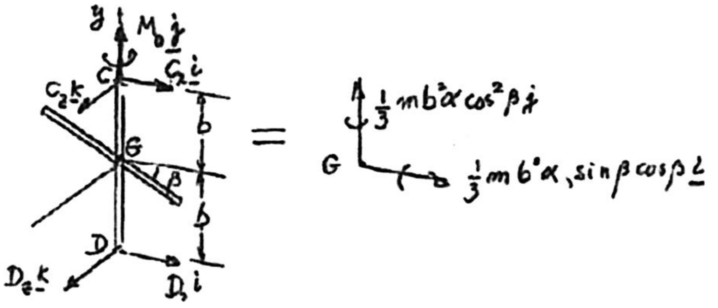
PROBLEM 18.71 (Continued)

<u>Equations of motion</u>: Equivalence of applied and effective forces.



$$\Sigma \mathbf{M}_D = \Sigma(\mathbf{M}_D)_{\text{eff}}: \quad 2b\mathbf{j}\times(C_x\mathbf{i}+C_z\mathbf{k})+M_0\mathbf{j}=\frac{1}{3}mb^2\alpha\sin\beta\cos\beta\mathbf{i}+\frac{1}{3}mb^2\alpha\cos^2\beta\mathbf{j}$$

$$-2bC_x\mathbf{k}+2bC_z\mathbf{i}+M_0\mathbf{j}=\frac{1}{3}mb^2\alpha\sin\beta\cos\beta\mathbf{i}+\frac{1}{3}mb^2\alpha\cos^2\beta\mathbf{j}$$

Equating the coefficients of **i**, **j**, **k**:

$$\mathbf{i}: \qquad 2bC_z=\frac{1}{3}mb^2\alpha\sin\beta\cos\beta \tag{3}$$

$$\mathbf{j}: \qquad M_0=\frac{1}{3}mb^2\alpha\cos^2\beta \tag{4}$$

$$\mathbf{k}: \qquad C_x=0 \tag{5}$$

(*a*) <u>Angular acceleration</u>.

From Eq. (4),

$$\alpha=\frac{3M_0}{mb^2\cos^2\beta} \blacktriangleleft$$

(*b*) <u>Initial dynamic reactions</u>.

From Eq. (3),

$$C_z=\frac{1}{6}mb\alpha\sin\beta\cos\beta=\frac{1}{6}mb\sin\beta\cos\beta\left(\frac{3M_0}{mb^2\cos^2\beta}\right)$$

$$C_z=\left(\frac{M_0}{2b}\right)\tan\beta$$

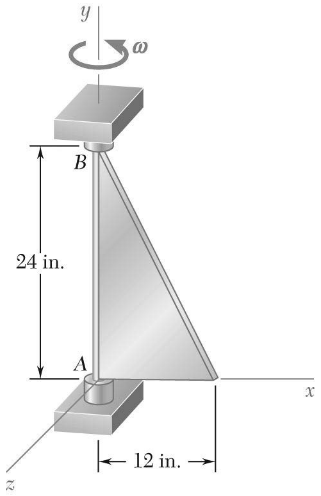
Recalling Eq. (5), $C_x=0$

$$\mathbf{C}=\left(\frac{M_0}{2b}\right)\tan\beta\mathbf{k} \blacktriangleleft$$

$\Sigma\mathbf{F}=\Sigma(\mathbf{F})_{\text{eff}}$: $\quad \mathbf{C}+\mathbf{D}=0, \quad \mathbf{D}=-\mathbf{C}$

$$\mathbf{D}=-\left(\frac{M_0}{2b}\right)\tan\beta\mathbf{k} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



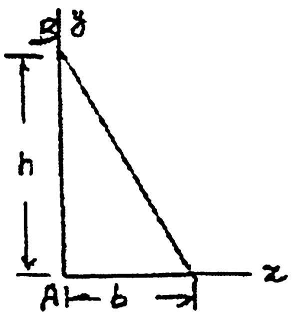
PROBLEM 18.72

Knowing that the plate of Problem 18.66 is initially at rest $(\omega = 0)$ when a couple of moment $\mathbf{M}_0 = (0.75\text{ ft}\cdot\text{lb})\mathbf{j}$ is applied to it, determine (*a*) the resulting angular acceleration of the plate, (*b*) the dynamic reactions *A* and *B* immediately after the couple has been applied.

PROBLEM 18.66 A thin homogeneous triangular plate of weight 10 pounds is welded to a light vertical axle supported by bearings at *A* and *B*. Knowing that the plate rotates at the constant rate $\omega = 8\text{ rad/s}$, determine the dynamic reactions at *A* and *B*.

SOLUTION

We shall use Eqs. (18.1) and (18.28):



$$\Sigma\mathbf{F} = m\bar{\mathbf{a}} \quad \Sigma\mathbf{M}_A = (\dot{\mathbf{H}}_A)_{Axyz} + \mathbf{\Omega}\times\mathbf{H}_A$$

Computation of $\mathbf{H}_A$:

$$\boldsymbol{\omega} = \omega\mathbf{j}$$

$$\mathbf{H}_A = -I_{xy}\omega\mathbf{i} + I_y\omega\mathbf{j} - I_{yz}\omega\mathbf{k}$$

The moment of inertia of the triangle is

$$(I_y)_{\text{area}} = \frac{1}{12}b^3h, \quad A = \frac{1}{2}bh$$

$$(I_y)_{\text{mass}} = \frac{m}{A}(I_y)_{\text{area}} = \frac{1}{6}mb^2$$

The product of inertia of the triangle is

$$(I_{xy})_{\text{area}} = \frac{1}{24}b^2h^2$$

$$(I_{xy})_{\text{mass}} = \frac{m}{A}(I_{xy})_{\text{area}} = \frac{1}{12}mbh$$

Since the *z*-coordinate is negligible,

$$(I_{yz})_{\text{mass}} = 0$$

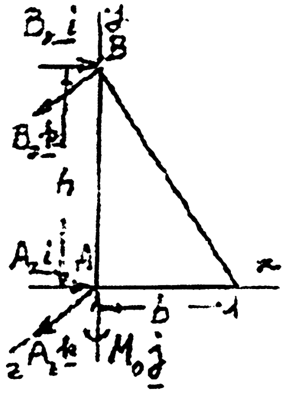
Thus, $$\mathbf{H}_A = -\frac{1}{12}mbh\omega\mathbf{i} + \frac{1}{6}mb^2\omega\mathbf{j} \qquad (1)$$

where the frame of reference *Axyz* rotates with the plate with the angular velocity

$$\mathbf{\Omega} = \boldsymbol{\omega} = \omega\mathbf{j}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 18.72 (Continued)



Equations of motion. We first use Eq. (18.28):

$$\Sigma \mathbf{M}_A = (\dot{\mathbf{H}}_A)_{Axyz} + \boldsymbol{\Omega} \times \mathbf{H}_A$$

Where $\mathbf{H}_A$ was obtained in Eq. (1) of Problem 18.66:

$$\mathbf{H}_A = -\frac{1}{12} mbh\omega \mathbf{i} + \frac{1}{6} mb^2 \omega \mathbf{j}$$

Differentiating with respect to the rotating frame:

$$(\dot{\mathbf{H}}_A)_{Axyz} = -\frac{1}{12} mbh\alpha \mathbf{i} + \frac{1}{6} mb^2 \alpha \mathbf{j}$$

Substituting for $\mathbf{H}_A$ and $(\dot{\mathbf{H}}_A)_{Axyz}$ into Eq. (18.28), noting that $\omega = 0$, and computing $\Sigma \mathbf{M}_A$ from diagram:

$$M_0 \mathbf{j} + h\mathbf{j} \times (B_x \mathbf{i} + B_z \mathbf{k}) = -\frac{1}{12} mbh\alpha \mathbf{i} + \frac{1}{6} mb^2 \alpha \mathbf{j} + 0$$

$$M_0 \mathbf{j} - hB_x \mathbf{k} + hB_z \mathbf{i} = -\frac{1}{12} mbh\alpha \mathbf{i} + \frac{1}{6} mb^2 \alpha \mathbf{j}$$

Equating the coefficients of the unit vectors:

$$\mathbf{j}: \quad M_0 = \frac{1}{6} mb^2 \alpha \qquad \alpha = \frac{6M_0}{mb^2}$$

(*a*)
$$\alpha = \frac{6(0.75 \text{ lb} \cdot \text{ft})}{(\frac{10 \text{ lb}}{32.2})(1 \text{ ft})^2} = 14.49 \text{ rad/s}^2$$

$\boldsymbol{\alpha} = (14.49 \text{ rad/s}^2)\mathbf{j}$ ◀

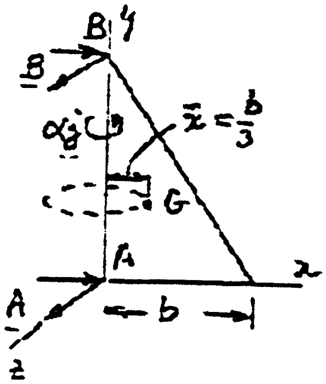
$$\mathbf{k}: \quad -hB_x = 0 \qquad B_x = 0$$

$$\mathbf{i}: \quad hB_z = -\frac{1}{12} mbh\alpha, \quad B_z = -\frac{1}{12} mb\alpha = -\frac{1}{12}\left(\frac{10 \text{ lb}}{32.2}\right)(1)(14.49)$$

(*b*)
$$B_z = -0.375 \text{ lb}$$

$\mathbf{B} = -(0.375 \text{ lb})\mathbf{k}$ ◀

We shall now apply Eq. (18.1): $\Sigma \mathbf{F} = m\bar{\mathbf{a}}$:



Since $\omega = 0$:
$$\bar{\mathbf{a}} = \bar{\mathbf{a}}_t = \alpha \mathbf{j} \times \frac{b}{3} \mathbf{i} = -\frac{1}{3} b\alpha \mathbf{k}$$

Substituting in Eq. (12.1):

$$\mathbf{A} + \mathbf{B} = -\frac{1}{3} mb\alpha \mathbf{k}$$

$$\mathbf{A} = -\frac{1}{3} mb\alpha \mathbf{k} - B$$

$$= -\frac{1}{3} mb\alpha \mathbf{k} + \frac{1}{12} mb\alpha \mathbf{k}$$

$$\mathbf{A} = -\frac{1}{4} mb\alpha \mathbf{k} = -\frac{1}{4}\left(\frac{10 \text{ lb}}{32.2}\right)(1 \text{ ft})(14.49 \text{ rad/s}^2)\mathbf{k}$$

$\mathbf{A} = -(1.125 \text{ lb})\mathbf{k}$ ◀

PROBLEM 18.73

The assembly of Problem 18.67 is initially at rest ($\omega = 0$) when a couple $\mathbf{M}_0$ is applied to axle AB. Knowing that the resulting angular acceleration of the assembly is $\boldsymbol{\alpha} = (150 \text{ rad/s}^2)\mathbf{i}$, determine (*a*) the couple $\mathbf{M}_0$, (*b*) the dynamic reactions at A and B immediately after the couple is applied.

SOLUTION

Mass of sheet metal: $m = \dfrac{2.7}{32.2} = 0.08385 \text{ lb} \cdot \text{s}^2/\text{ft}$

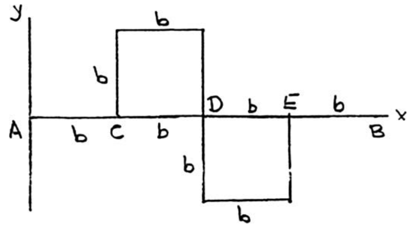
Sheet metal dimension: $b = 6 \text{ in.} = 0.5 \text{ ft}$

Area of sheet metal: $A = \dfrac{1}{2}b^2 + b^2 + b^2 + \dfrac{1}{2}b^2 = 3b^2 = 0.75 \text{ ft}^2$

Let $\rho = \dfrac{m}{A} = \dfrac{0.08385}{0.75} = 0.1118 \text{ lb} \cdot \text{s}^2/\text{ft}^3 = \text{mass per unit area}$

Moments and products of inertia: $(I)_{\text{mass}} = \rho I_{(\text{area})}$

xy plane (rectangles)



$$I_x = \frac{1}{3}b^4 + \frac{1}{3}b^4 = \frac{2}{3}b^4$$

$$I_x = \frac{2}{3}\rho b^4 = \frac{2}{3}(0.1118)(0.5)^4$$

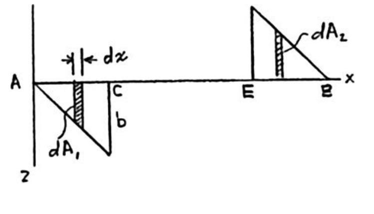
$$= 4.658 \times 10^{-3} \text{ lb} \cdot \text{s}^2 \cdot \text{ft}$$

$$I_{xy} = (b^2)\left(\frac{3}{2}b\right)\left(\frac{1}{2}b\right) + (b^2)\left(\frac{5}{2}b\right)\left(-\frac{1}{2}b\right) = -\frac{1}{2}b^4$$

$$I_{xy} = -\frac{1}{4}\rho b^4 = -\frac{1}{4}(0.1118)(0.5)^4$$

$$= -3.4938 \times 10^{-3} \text{ lb} \cdot \text{s}^2 \cdot \text{ft}$$

xz plane (triangles)



$$I_x = \frac{1}{12}b^4 + \frac{1}{12}b^4 = \frac{1}{6}b^4$$

$$I_x = \frac{1}{6}\rho b^4 = \frac{1}{6}(0.1118)(0.5)^4$$

$$= 1.1646 \times 10^{-3} \text{ lb} \cdot \text{s}^2 \cdot \text{ft}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 18.73 (Continued)

For calculation of I_{xz}, use pairs of elements dA_1 and dA_2: $\quad dA_2 = dA_1$

$$I_{xz} = \int x\frac{z}{2}dA_1 + \int(4b-x)\left(-\frac{z}{2}\right)dA_2 = -\int(2b-x)z\,dA_1 = -\int_0^b(2b-x)z^2dx$$

But $z = x$.

Hence,
$$I_{xz} = -\int_0^a(2bx^2 - x^3)dx = -\left(\frac{2}{3}b^4 - \frac{1}{4}b^4\right) = -\frac{5}{12}b^4$$

$$I_{xz} = -\frac{5}{12}\rho b^4 = -\frac{5}{12}(0.1118)(0.5)^4 = -2.9115\times10^{-3}\ \text{lb}\cdot\text{s}^2\cdot\text{ft}$$

Total for I_x:
$$I_x = 4.658\times10^{-3} + 1.1646\times10^{-3} = 5.823\times10^{-3}\ \text{kg}\cdot\text{m}^2$$

The mass center lies on the rotation axis, therefore, $\overline{\mathbf{a}} = 0$

$$\Sigma\mathbf{F} = \mathbf{A} + \mathbf{B} = m\overline{\mathbf{a}} = 0 \qquad \mathbf{A} = -\mathbf{B}$$

$$\mathbf{H}_A = I_x\omega\mathbf{i} - I_{xy}\omega\mathbf{j} - I_{xz}\omega\mathbf{k} \qquad \boldsymbol{\omega} = \omega\mathbf{i}, \qquad \boldsymbol{\alpha} = \alpha\mathbf{i}$$

Let the frame of reference *Axyz* be rotating with angular velocity $\boldsymbol{\Omega} = \boldsymbol{\omega} = \omega\mathbf{i}$.

$$\Sigma\mathbf{M}_A = \dot{\mathbf{H}}_A = (\dot{\mathbf{H}}_A)_{Axyz} + \boldsymbol{\Omega}\times\mathbf{H}_A$$

$$M_0\mathbf{i} + 4b\mathbf{i}\times(B_y\mathbf{j} + B_z\mathbf{k}) = I_x\alpha\mathbf{i} - I_{xy}\alpha\mathbf{j} - I_{xz}\alpha\mathbf{k} + \omega\mathbf{i}\times(I_x\omega\mathbf{i} - I_{xy}\omega\mathbf{j} - I_{xz}\omega\mathbf{k})$$

$$M_0\mathbf{i} - 4bB_z\mathbf{j} + 4bB_y\mathbf{k} = I_x\alpha\mathbf{i} - (I_{xy}\alpha - I_{xz}\omega^2)\mathbf{j} - (I_{xz}\alpha + I_{xy}\omega^2)\mathbf{k}$$

Resolve into components and solve for B_y and B_z.

i: $\quad M_0 = I_x\alpha$

j: $\quad B_z = \dfrac{(I_{xy}\alpha - I_{xz}\omega^2)}{4b}$

k: $\quad B_y = -\dfrac{(I_{xz}\alpha + I_{xy}\omega^2)}{4b}$

<u>Data</u>: $\quad \alpha = 150\ \text{rad/s}^2, \quad \omega = 0, \quad b = 0.5\ \text{ft}$

(*a*) $\quad M_0 = (5.823\times10^{-3})(150) = 0.87345\ \text{lb}\cdot\text{ft}$ $\qquad M_0 = (0.873\ \text{lb}\cdot\text{ft})\mathbf{i}$ ◀

(*b*)
$$B_z = \frac{(-3.4938\times10^{-3})(150) - 0}{(4)(0.5)} = -0.262\ \text{lb}$$

$$B_y = -\frac{(-2.9115\times10^{-3})(150) + 0}{(4)(0.5)} = 0.218\ \text{lb}$$

$$A_y = -B_y = -0.218\ \text{lb}$$

$$A_z = -B_z = 0.262\ \text{lb}$$

$\mathbf{A} = -(0.218\ \text{lb})\mathbf{j} + (0.262\ \text{lb})\mathbf{k}$ ◀

$\mathbf{B} = (0.218\ \text{lb})\mathbf{j} - (0.262\ \text{lb})\mathbf{k}$ ◀

PROBLEM 18.74

The shaft of Problem 18.68 is initially at rest $(\omega = 0)$ when a couple $\mathbf{M}_0$ is applied to it. Knowing that the resulting angular acceleration of the shaft is $\boldsymbol{\alpha} = (20\ \text{rad/s}^2)\mathbf{i}$, determine (*a*) the couple $\mathbf{M}_0$, (*b*) the dynamic reactions at *A* and *B* immediately after the couple is applied.

PROBLEM 18.68 The 8-kg shaft shown has a uniform cross section. Knowing that the shaft rotates at the constant rate $\omega = 12$ rad/s, determine the dynamic reactions at *A* and *B*.

SOLUTION

Angular velocity and angular acceleration: $\dot{\boldsymbol{\omega}} = \dot{\omega}\mathbf{i} = \alpha\mathbf{i}$

Angular momentum about the mass center *G*: $\mathbf{H}_G = \bar{I}_x\omega\mathbf{i} - \bar{I}_{xy}\omega\mathbf{j} - \bar{I}_{xz}\omega\mathbf{k}$

Let the reference frame *Axyz* be rotating with angular velocity $\Omega = \omega\mathbf{i} = 0$

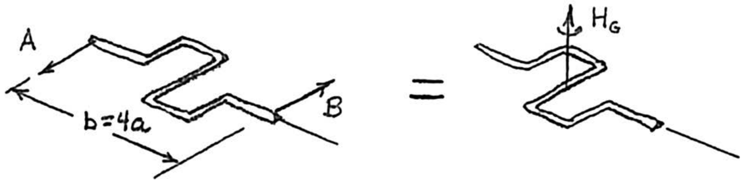
$$\begin{aligned}\dot{\mathbf{H}}_G &= (\dot{\mathbf{H}}_G)_{Axyz} + \boldsymbol{\Omega}\times\mathbf{H}_G \\ &= \bar{I}_x\alpha\mathbf{i} - \bar{I}_{xy}\alpha\mathbf{j} - \bar{I}_{xz}\alpha\mathbf{k} + 0 \\ &= \bar{I}_x\alpha\mathbf{i} - \bar{I}_{xy}\alpha\mathbf{j} - \bar{I}_{xz}\alpha\mathbf{k}\end{aligned}$$

Since the shaft lies in the *xz* plane, $\bar{I}_{xy} = 0$.

By symmetry, the mass center lies on line *AB*. $m\bar{\mathbf{a}} = 0$

$\Sigma\mathbf{F} = \Sigma F_{\text{eff}}:\quad \mathbf{A} + \mathbf{B} = m\bar{\mathbf{a}} = 0$ **A** and **B** form a couple.

$\mathbf{A} = -\mathbf{B}$



$$M_0\mathbf{i} + b\mathbf{i}\times(B_y\mathbf{j} + B_z\mathbf{k}) = \dot{\mathbf{H}}_G$$

$$M_0\mathbf{i} + bB_y\mathbf{k} - bB_z\mathbf{j} = \bar{I}_x\alpha\mathbf{i} - \bar{I}_{xz}\alpha\mathbf{k}$$

$$M_0 = \bar{I}_x\alpha,\quad B_y = -\frac{I_{xz}\alpha}{b},\quad B_z = 0$$

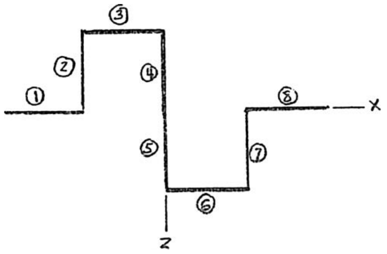
Calculation of $\bar{I}_x$ and I_{xz}.



Divide the shaft into eight segments, each of length

$$a = 200 \text{ mm} = 0.2 \text{ m}$$

Let m' be the mass of one segment.

$$m' = \frac{8 \text{ kg}}{8} = 1 \text{ kg}$$

For ① and ⑧, $\quad I_x = 0$

For ②, ④, ⑤, and ⑦, $\quad I_x = \frac{1}{3}ma^2$

For ③ and ⑥, $\quad I_x = m'a^2$

Total: $\quad \bar{I}_x = \frac{10}{3}m'a^2$

For ①, ④, ⑤, and ⑧, $\quad I_{xz} = 0$

For ②, ③, ⑥, and ⑦,

$$I_{xz} = m'(-a)\left(-\frac{a}{2}\right) + m'\left(-\frac{a}{2}\right)(-a) + m'\left(\frac{a}{2}\right)(a) + m'(a)\left(\frac{a}{2}\right) = 2m'a^2$$

(*a*)

$$M_0 = \frac{10}{3}m'a^2\alpha = \frac{10}{3}(1)(0.2)^2(20)$$

$\mathbf{M}_0 = (2.67 \text{ N}\cdot\text{m})\mathbf{i}$ ◀

(*b*)

$$B_y = -\frac{2m'a^2\alpha}{b} = -\frac{(2)(1)(0.2)^2(20)}{(4)(0.2)}$$

$\mathbf{B} = -(2.00 \text{ N})\mathbf{j}$ ◀

$$A_z = 0, \quad A_y = -B_y = 2 \text{ N}$$

$\mathbf{A} = (2.00 \text{ N})\mathbf{j}$ ◀

PROBLEM 18.77

The sheet-metal component shown is of uniform thickness and has a mass of 600 g. It is attached to a light axle supported by bearings at A and B located 150 mm apart. The component is at rest when it is subjected to a couple $\mathbf{M}_0$ as shown. If the resulting angular acceleration is $\boldsymbol{\alpha} = (12 \text{ rad/s}^2)\mathbf{k}$, determine ($a$) the couple $\mathbf{M}_0$, (b) the dynamic reactions at A and B immediately after the couple has been applied.

SOLUTION

The sheet metal component rotates about the fixed z axis, so that Equations (18.29) of the textbook apply. These are relisted below as equations (1), (2), and (3).

$$\Sigma M_x = -I_{xz}\alpha + I_{yz}\omega^2 \quad (1)$$

$$\Sigma M_y = -I_{yz}\alpha - I_{xz}\omega^2 \quad (2)$$

$$\Sigma M_z = I_z\alpha \quad (3)$$

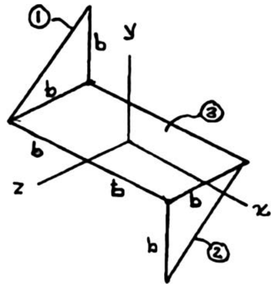
Calculation of the required moment and products of inertia.

Total mass: $m = 600 \text{ g} = 0.6 \text{ kg}$

Total area: $A = \frac{1}{2}(0.075)^2 + (0.150)(0.075) + \frac{1}{2}(0.075)^2 = 16.875\times 10^{-3} \text{ m}^2$

Let ρ be the mass per unit area. $\rho = \frac{m}{A} = 35.556 \text{ kg/m}^2$

The component is comprised of 3 parts: triangle ①, triangle ②, and rectangle ③ as shown. Let the lengths of 75 mm be labeled b.



Triangle ①. The equation of the upper edge is

$$y = \frac{b}{2} - z$$

Use elements of width dz and height y.

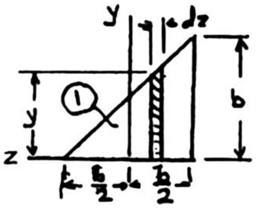
$$dm = \rho y dz \qquad (d\bar{I}_z)_{\text{el}} = \frac{1}{12}y^2 dm$$

$$(d\bar{I}_{xz})_{\text{el}} = 0 \qquad (d\bar{I}_{yz})_{\text{el}} = 0$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

Coordinates of the element mass center:

$$\bar{x}_{\text{el}} = -b, \qquad \bar{y}_{\text{el}} = \frac{1}{2}y, \qquad \bar{z}_{\text{el}} = z$$



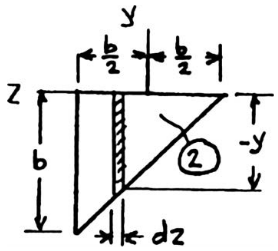
$$dI_{xz} = (d\bar{I}_{xz})_{\text{el}} + \bar{x}_{\text{el}}\bar{z}_{\text{el}}dm$$

$$= 0 + (-b)z(\rho y d_z) = -\rho bz\left(\frac{b}{2} - z\right)dz$$

$$I_{xz} = -\rho b\int_{-b/2}^{b/2} z\left(\frac{b}{2} - z\right)dz = \frac{1}{12}\rho b^4$$

$$dI_{yz} = (d\bar{I}_{yz})_{\text{el}} + \bar{y}_{\text{el}}\bar{z}_{\text{el}}dm$$

$$= 0 + \left(\frac{1}{2}y\right)z(\rho y dz) = \frac{1}{2}\rho\left(\frac{b}{2} - z\right)^2 zdz$$



$$I_{yz} = \frac{1}{2}\rho\int_{-b/2}^{b/2}\left(\frac{b}{2} - z\right)^2 zdz = -\frac{1}{24}\rho b^4$$

$$dI_z = (d\bar{I}_z)_{\text{el}} + (\bar{x}_{\text{el}}^2 + \bar{y}_{\text{el}}^2)dm$$

$$= \left(\frac{1}{12}y^2 + b^2 + \frac{1}{4}y^2\right)\rho y dz = \rho\left(b^2 y + \frac{1}{3}y^3\right)dz$$

$$= \rho\left(\frac{13}{24}b^3 - \frac{5}{4}b^2 z + \frac{1}{2}bz^2 - \frac{1}{3}z^3\right)dz$$

$$I_z = \rho\int_{-b/2}^{b/2}\left(\frac{13}{24}b^3 - \frac{5}{4}b^2 z + \frac{1}{2}bz^2 - \frac{1}{3}z^3\right)dz = \frac{7}{12}\rho b^4$$

Applying the data,

$$I_{xz} = \frac{1}{12}(35.556)(0.075)^4 = 93.75\times10^{-6}\ \text{kg}\cdot\text{m}^2$$

$$I_{yz} = -\frac{1}{24}(35.556)(0.075)^4 = -46.875\times10^{-6}\ \text{kg}\cdot\text{m}^2$$

$$I_z = \frac{7}{12}(35.556)(0.075)^4 = 656.25\times10^{-6}\ \text{kg}\cdot\text{m}^2$$

PROBLEM 18.77 (Continued)

Triangle ②. The equation of the lower edge is $y = -\left(\frac{b}{2} - z\right)$.

Use elements of width dz and height $-y$.

$$dm = -\rho y dz, \qquad (d\bar{I}_z)_{\text{el}} = \frac{1}{12} y^2 dm, \qquad (d\bar{I}_{zx})_{\text{el}} = 0, \qquad (d\bar{I}_{yz})_{\text{el}} = 0$$

Coordinates of the element mass center:

$$\bar{x}_{\text{el}} = b, \qquad \bar{y}_{\text{el}} = \frac{1}{2} y, \qquad \bar{z}_{\text{el}} = z$$

The integrals for I_{xz}, I_{yz}, and I_z turn out to be the same as those of triangle ①.

$$I_{xz} = 93.75 \times 10^{-6}\ \text{kg} \cdot \text{m}^2, \quad I_{yz} = -46.875 \times 10^{-6}\ \text{kg} \cdot \text{m}^2, \quad I_z = 656.25 \times 10^{-6}\ \text{kg} \cdot \text{m}^2$$

Rectangle ③. Area: $A = (0.150)(0.075) = 11.25 \times 10^{-3}\ \text{m}^2$

Mass: $m = \rho A = 400 \times 10^{-3}\ \text{kg}$

$$I_{xz} = 0, \qquad I_{yz} = 0$$

$$I_z = \frac{1}{12} m(2b)^2 = \frac{1}{12}(400 \times 10^{-3})(0.150)^2 = 750 \times 10^{-6}\ \text{kg} \cdot \text{m}^2$$

Totals.

$$I_{xz} = \Sigma I_{xz} = 187.5 \times 10^{-6}\ \text{kg} \cdot \text{m}^2$$

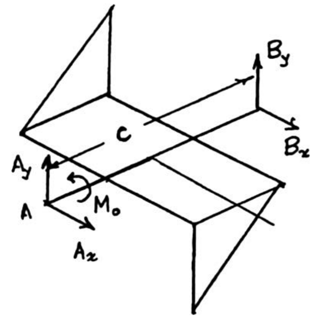
$$I_{yz} = \Sigma I_{yz} = -93.75 \times 10^{-6}\ \text{kg} \cdot \text{m}^2$$

$$I_z = \Sigma I_z = 2062.5 \times 10^{-6}\ \text{kg} \cdot \text{m}^2$$

Since the mass center lies on the fixed axis, the acceleration $\bar{\mathbf{a}}$ of the mass center is zero.

$$\Sigma \mathbf{F} = m\bar{\mathbf{a}} = 0$$

The reactions at *A* and *B* form a couple.



$$\mathbf{B} = -\mathbf{A}$$

Let $\mathbf{A} = A_x \mathbf{i} + A_y \mathbf{j}$

Resultant couple acting on the body:

$$\mathbf{M} = c\mathbf{k} \times (A_x \mathbf{i} + A_y \mathbf{j}) + M_0 \mathbf{k}$$

$$= -cA_y \mathbf{i} + cA_x \mathbf{j} + M_0 \mathbf{k}$$

(*a*) <u>Moment M_0</u>. Using Equation (3),

$$\Sigma M_z = M_0 = I_z \alpha = (2062.5 \times 10^{-6})(12) \qquad M_0 = 24.8 \times 10^{-3}\ \text{N} \cdot \text{m} \blacktriangleleft$$

PROBLEM 18.78

For the sheet-metal component of Problem 18.77, determine (*a*) the angular velocity of the component 0.6 s after the couple $\mathbf{M}_0$ has been applied to it, (*b*) the magnitude of the dynamic reactions at *A* and *B* at that time.

SOLUTION

The sheet metal component rotates about the fixed *z* axis with angular acceleration $\boldsymbol{\alpha} = (12 \text{ rad/s}^2)\mathbf{k}$.

(*a*) *Angular velocity at* $t = 0.6$ s.

$$\omega = \omega_0 + \alpha t = 0 + (12)(0.6) = 7.2 \text{ rad/s}$$

$\boldsymbol{\omega} = (7.20 \text{ rad/s})\mathbf{k}$ ◀

(*b*) *Dynamic reactions.*

Equations (18.29) of the textbook apply. These are relisted below as equations (1), (2), and (3).

$$\Sigma M_x = -I_{xz}\alpha + I_{yz}\omega^2 \quad (1)$$

$$\Sigma M_y = -I_{yz}\alpha - I_{xz}\omega^2 \quad (2)$$

$$\Sigma M_z = I_z\alpha \quad (3)$$

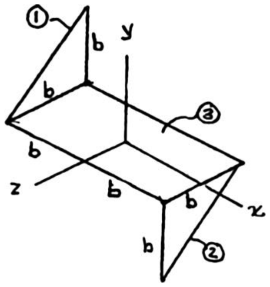
Calculation of the required moment and products of inertia.

Total mass: $m = 600 \text{ g} = 0.6 \text{ kg}$

Total area: $A = \frac{1}{2}(0.075)^2 + (0.150)(0.075) + \frac{1}{2}(0.075)^2 = 16.875 \times 10^{-3} \text{ m}^2$

Let ρ be the mass per unit area. $\rho = \frac{m}{A} = 35.556 \text{ kg/m}^2$

The component is comprised of 3 parts: triangle ①, triangle ②, and rectangle ③ as shown. Let the lengths of 75 mm be labeled *b*.



Triangle ①. The equation of the upper edge is

$$y = \frac{b}{2} - z$$

Use elements of width *dz* and height *y*.

$$dm = \rho y dz \qquad (d\bar{I}_z)_{\text{el}} = \frac{1}{12}y^2 dm$$

$$(d\bar{I}_{xz})_{\text{el}} = 0 \qquad (d\bar{I}_{yz})_{\text{el}} = 0$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 18.78 (Continued)

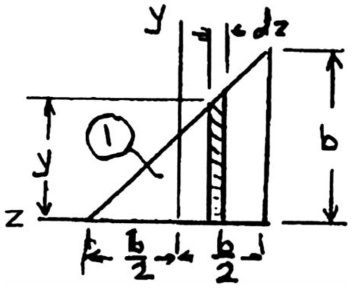
Coordinates of the element mass center:



$$\bar{x}_{\text{el}} = -b, \ \bar{y}_{\text{el}} = \frac{1}{2}y, \quad \bar{z}_{\text{el}} = z$$

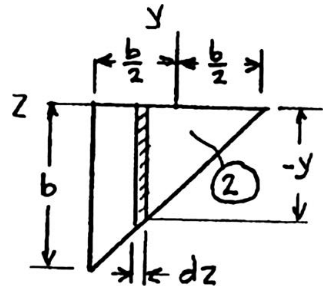
$$dI_{xz} = (d\bar{I}_{xz})_{\text{el}} + \bar{x}_{\text{el}}\bar{z}_{\text{el}}dm$$

$$= 0 + (-b)z(\rho y dz) = -\rho bz\left(\frac{b}{2} - z\right)dz$$

$$I_{xz} = -\rho b\int_{-b/2}^{b/2} z\left(\frac{b}{2} - z\right)dz = \frac{1}{12}\rho b^4$$

$$dI_{yz} = (d\bar{I}_{yz})_{\text{el}} + \bar{y}_{\text{el}}\bar{z}_{\text{el}}dm$$

$$= 0 + \left(\frac{1}{2}y\right)z(\rho y dz) = \frac{1}{2}\rho\left(\frac{b}{2} - z\right)^2 z dz$$



$$I_{yz} = \frac{1}{2}\rho\int_{-b/2}^{b/2}\left(\frac{b}{2} - z\right)^2 z dz = -\frac{1}{24}\rho b^4$$

$$dI_z = (d\bar{I}_z)_{\text{el}} + \left(\bar{x}_{\text{el}}^2 + \bar{y}_{\text{el}}^2\right)dm$$

$$= \left(\frac{1}{12}y^2 + b^2 + \frac{1}{4}y^2\right)\rho y_i dz = \rho\left(b^2 y + \frac{1}{3}y^3\right)dz$$

$$= \rho\left(\frac{13}{24}b^3 - \frac{5}{4}b^2 z + \frac{1}{2}bz^2 - \frac{1}{3}z^3\right)dz$$

$$I_z = \rho\int_{-b/2}^{b/2}\left(\frac{13}{24}b^3 - \frac{5}{4}b^2 z + \frac{1}{2}bz^2 - \frac{1}{3}z^3\right)dz = \frac{7}{12}\rho b^4$$

Applying the data,

$$I_{xz} = \frac{1}{12}(35.556)(0.075)^4 = 93.75\times 10^{-6}\ \text{kg}\cdot\text{m}^2$$

$$I_{yz} = -\frac{1}{24}(35.556)(0.075)^4 = -46.875\times 10^{-6}\ \text{kg}\cdot\text{m}^2$$

$$I_z = \frac{7}{12}(35.556)(0.075)^4 = 656.25\times 10^{6}\ \text{kg}\cdot\text{m}^2$$

Triangle ②. The equation of the lower edge is $\qquad y = -\left(\frac{b}{2} - z\right).$

Use elements of width dz and height $-y$.

$$dm = -\rho y dz, \quad (d\bar{I}_z)_{\text{el}} = \frac{1}{12}y^2 dm, \quad (d\bar{I}_{zx})_{\text{el}} = 0, \quad (d\bar{I}_{yz})_{\text{el}} = 0$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. If you are a student using this Manual, you are using it without permission.*

Coordinates of the element mass center:

$$\bar{x}_{el} = b, \qquad \bar{y}_{el} = \frac{1}{2}y, \qquad \bar{z}_{el} = z$$

The integrals for I_{xz}, I_{yz}, and I_z turn out to be the same as those of triangle ①.

$$I_{xz} = 93.75\times10^{-3}\ \text{kg}\cdot\text{m}^2, \quad I_{yz} = -46.875\times10^{-6}\ \text{kg}\cdot\text{m}^2, \quad I_z = 656.25\times10^{-6}\ \text{kg}\cdot\text{m}^2$$

Rectangle ③. Area: $A = (0.150)(0.075) = 11.25\times10^{-3}\ \text{m}^2$

Mass: $m = \rho A = 400\times10^{-3}\ \text{kg}$

$$I_{xz} = 0, \qquad I_{yz} = 0$$

$$I_z = \frac{1}{12}m(2b)^2 = \frac{1}{12}(400\times10^{-3})(0.150)^2 = 750\times10^{-6}\ \text{kg}\cdot\text{m}^2$$

Totals.

$$I_{xz} = \Sigma I_{xz} = 187.5\times10^{-6}\ \text{kg}\cdot\text{m}^2$$

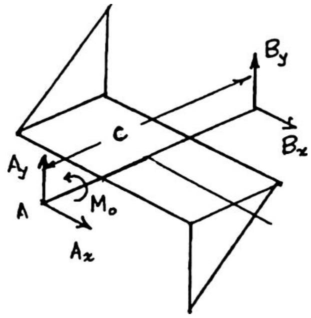
$$I_{yz} = \Sigma I_{yz} = -93.75\times10^{-6}\ \text{kg}\cdot\text{m}^2$$

$$I_z = \Sigma I_z = 2062.5\times10^{-6}\ \text{kg}\cdot\text{m}^2$$

Since the mass center lies on the fixed axis, the acceleration $\bar{\mathbf{a}}$ of the mass center is zero.

$$\Sigma\mathbf{F} = m\bar{\mathbf{a}} = 0$$

The reactions at A and B form a couple.



$$\mathbf{B} = -\mathbf{A}$$

Let $\mathbf{A} = A_x\mathbf{i} + A_y\mathbf{j}$

Resultant couple acting on the body:

$$\mathbf{M} = c\mathbf{k}\times(A_x\mathbf{i} + A_y\mathbf{j}) + M_0\mathbf{k}$$

$$= -cA_y\mathbf{i} + cA_x\mathbf{j} + M_0\mathbf{k}$$

From Eq. (1), $-cA_y = -I_{xz}\alpha + I_{yz}\omega^2$

$$A_y = \frac{I_{xz}\alpha}{c} - \frac{I_{yz}\omega^2}{c} = \frac{(187.5\times10^{-6})(12)}{0.150} - \frac{(-93.75\times10^{-6})(7.2)^2}{0.150} = 47.4\times10^{-3}\ \text{N}$$

From Eq. (2), $cA_x = -I_{yz}\alpha - I_{xz}\omega^2$

$$A_x = -\frac{I_{yz}\alpha}{c} - \frac{I_{xz}\omega^2}{c} = -\frac{(-93.75\times10^{-6})(12)}{0.150} - \frac{(187.5\times10^{-6})(7.2)^2}{0.150} = -57.3\times10^{-3}\ \text{N}$$

$$\mathbf{A} = -(57.3\times10^{-3}\ \text{N})\mathbf{i} + (47.3\times10^{-3}\ \text{N})\mathbf{j} \ ◀$$

$$\mathbf{B} = (57.3\times10^{-3}\ \text{N})\mathbf{i} - (47.3\times10^{-3}\ \text{N})\mathbf{j} \ ◀$$

PROBLEM 18.79

The blade of an oscillating fan and the rotor of its motor have a total weight of 300 g and a combined radius of gyration of 75 mm. They are supported by bearings at *A* and *B*, 125 mm apart, and rotate at the rate $\omega_1 = 1800$ rpm. Determine the dynamic reactions at *A* and *B* when the motor casing has an angular velocity $\boldsymbol{\omega}_2 = (0.6 \text{ rad/s})\mathbf{j}$.

SOLUTION

$$\boldsymbol{\omega}_1 = \omega_1 \mathbf{i}$$

$$\omega_1 = \frac{2\pi(1800)}{60} = 188.5 \text{ rad/s}$$

Angular velocity: $\boldsymbol{\omega} = \omega_1 \mathbf{i} + \omega_2 \mathbf{j}$

Angular momentum: $\mathbf{H}_G = I_x \omega_1 \mathbf{i} + I_y \omega_2 \mathbf{j}$

Let the reference frame be rotating with angular velocity $\boldsymbol{\Omega} = \omega_2 \mathbf{j}$.

$$\dot{\mathbf{H}}_G = (\dot{\mathbf{H}}_G)_{Gxyz} + \boldsymbol{\Omega} \times \mathbf{H}_G$$
$$= 0 + \omega_2 \mathbf{j} \times (I_x \omega_1 \mathbf{i} + I_y \omega_2 \mathbf{j})$$
$$= -I_x \omega_1 \omega_2 \mathbf{k}$$

Assume that the acceleration of the mass center is negligible. Then the dynamic reactions at *A* and *B* reduce to a couple.

$$\mathbf{A} = -\mathbf{B}$$

$$\mathbf{M} = b\mathbf{i} \times \mathbf{B}$$
$$= b\mathbf{i} \times (B_y \mathbf{j} + B_z \mathbf{k})$$
$$= -bB_z \mathbf{j} + bB_y \mathbf{k}$$

$\mathbf{M} = \dot{\mathbf{H}}_G$ Resolve into components.

$\mathbf{j}$: $-bB_z = 0 \qquad B_z = 0, \qquad A_z = 0$

$\mathbf{k}$: $bB_y = -I_x \omega_1 \omega_2 \qquad B_y = -\dfrac{I_x \omega_1 \omega_2}{b} = -\dfrac{mk_x^2 \omega_1 \omega_2}{b}$

PROBLEM 18.80

The blade of a portable saw and the rotor of its motor have a total weight of 2.5 lb and a combined radius of gyration of 1.5 in. Knowing that the blade rotates as shown at the rate $\omega_1 = 1500$ rpm, determine the magnitude and direction of the couple **M** that a worker must exert on the handle of the saw to rotate it with a constant angular velocity $\boldsymbol{\omega}_2 = -(2.4 \text{ rad/s})\mathbf{j}$.

SOLUTION

$$\boldsymbol{\omega}_1 = \frac{(2\pi)(1500)}{60} = 157.08 \text{ rad/s}$$

$$\boldsymbol{\omega}_1 = \omega_1 \mathbf{k}$$

Angular velocity: $\boldsymbol{\omega} = \omega_2 \mathbf{j} + \omega_1 \mathbf{k}$

Angular momentum of rotor: $\mathbf{H}_G = I_y \omega_2 \mathbf{j} + I_z \omega_1 \mathbf{k}$

Let the reference frame *Gxyz* be rotating with angular velocity $\boldsymbol{\Omega} = \omega_2 \mathbf{j}$.

$$\dot{\mathbf{H}}_G = (\dot{\mathbf{H}}_G)_{Gxyz} + \boldsymbol{\Omega} \times \mathbf{H}_G$$
$$= 0 + \omega_2 \mathbf{j} \times (I_y \omega_2 \mathbf{j} + I_z \omega_1 \mathbf{k})$$
$$= I_z \omega_1 \omega_2 \mathbf{i}$$

Couple exerted on the saw:

$$\mathbf{M} = \dot{\mathbf{H}}_G = I_z \omega_1 \omega_2 \mathbf{i} = m k_z^2 \omega_1 \omega_2 \mathbf{i}$$

Data:

$$W = 2.5 \text{ lb}$$

$$m = \frac{2.5}{32.2} = 0.07764 \text{ lb} \cdot \text{s}^2/\text{ft}$$

$$k_z = 1.5 \text{ in.} = 0.125 \text{ ft}$$

$$\mathbf{M} = (0.07764)(0.125)^2(157.08)(-2.4)\mathbf{i}$$

$$\mathbf{M} = -(0.457 \text{ lb} \cdot \text{ft})\mathbf{i} \blacktriangleleft$$

PROBLEM 18.81

The flywheel of an automobile engine, which is rigidly attached to the crankshaft, is equivalent to a 400-mm-diameter, 15-mm-thick steel plate. Determine the magnitude of the couple exerted by the flywheel on the horizontal crankshaft as the automobile travels around an unbanked curve of 200-m radius at a speed of 90 km/h, with the flywheel rotating at 2700 rpm. Assume the automobile to have (*a*) a rear-wheel drive with the engine mounted longitudinally, (*b*) a front-wheel drive with the engine mounted transversely. (Density of steel $= 7860\ \text{kg/m}^3$.)

SOLUTION

Let the *x* axis be a horizontal axis directed along the engine mounting, i.e., longitudinally for rear-wheel drive and transversely for front-wheel drive.

Let the *y* axis be vertical.

The angular velocity of the automobile, $\boldsymbol{\omega}_2$, is equal to $(v/\rho)\mathbf{j}$, where

$$v = 90\ \text{km/h} = 25\ \text{m/s} \ \text{ and } \ \rho = 200\ \text{m}.$$

$$\boldsymbol{\omega}_2 = \frac{25}{200}\mathbf{j} = (0.125\ \text{rad/s})\mathbf{j}$$

Angular velocity of the fly wheel relative to the automobile: $\boldsymbol{\omega}_1 = \omega_1\mathbf{i}$

where $\omega_1 = \dfrac{2\pi(2700)}{60} = 282.74\ \text{rad/s}$

Angular momentum of fly wheel: $\mathbf{H}_G = I_x\omega_1\mathbf{i} + I_y\omega_y\mathbf{j}$

Let the reference frame *Gxyz* be rotating with angular velocity $\boldsymbol{\Omega} = \omega_2\mathbf{j}$

$$\begin{aligned}\dot{\mathbf{H}}_G &= (\dot{\mathbf{H}}_G)_{Gxyz} + \boldsymbol{\Omega}\times\mathbf{H}_G \\ &= 0 + \omega_2\mathbf{j}\times(I_x\omega_1\mathbf{i} + I_y\omega_2\mathbf{j}) \\ &= -I_x\omega_1\omega_2\mathbf{k}\end{aligned}$$

Couple exerted by the shaft on the fly wheel: $\mathbf{M} = -I_x\omega_1\omega_2\mathbf{k}$

Couple exerted by the fly wheel on the shaft: $\mathbf{M}' = -\mathbf{M} = I_x\omega_1\omega_2\mathbf{k}$ (1)

Data for fly wheel: $m = \rho\left(\dfrac{\pi}{4}d^2\right)t = (7860)\dfrac{\pi}{4}(0.4)^2(0.015) = 14.816\ \text{kg}$

For a circular plate, $I_x = \dfrac{1}{2}mr^2 = \dfrac{1}{2}(14.816)(0.2)^2 = 0.29632\ \text{kg}\cdot\text{m}^2$

Using Equation (1), $\mathbf{M}' = (0.29632)(282.74)(0.125)\mathbf{k} = (10.47\ \text{N}\cdot\text{m})\mathbf{k}$

(*a*) Magnitude of couple for rear-wheel drive: $M' = 10.47\ \text{N}\cdot\text{m}$ ◀

(*b*) For front-wheel drive: $M' = 10.47\ \text{N}\cdot\text{m}$ ◀

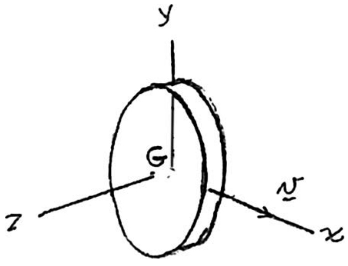
PROBLEM 18.82

Each wheel of an automobile has a mass of 22 kg, a diameter of 575 mm, and a radius of gyration of 225 mm. The automobile travels around an unbanked curve of radius 150 m at a speed of 95 km/h. Knowing that the transverse distance between the wheels is 1.5 m, determine the additional normal force exerted by the ground on each outside wheel due to the motion of the car.

SOLUTION



For each wheel, $v = 95 \text{ km/h} = 26.389 \text{ m/s}$

$$\omega_x = 0$$

$$\omega_y = \frac{v}{\rho} = \frac{26.389}{150} = 0.17593 \text{ rad/s}$$

$$r = \frac{d}{2} = \frac{575}{2} = 287.5 \text{ mm} = 0.2875 \text{ m}$$

$$\bar{I}_z = mk^2 = (22)(0.225)^2 = 1.11375 \text{ kg}\cdot\text{m}^2$$

$$\omega_z = -\frac{v}{r} = -\frac{26.389}{0.2875} = -91.787 \text{ rad/s}$$

$$\mathbf{H}_G = \bar{I}_x\omega_x\mathbf{i} + \bar{I}_y\omega_y\mathbf{j} + \bar{I}_z\omega_z\mathbf{k}$$

$$= \bar{I}_y\omega_y\mathbf{j} + \bar{I}_z\omega_z\mathbf{k}$$

Let reference frame $Gxyz$ be rotating with angular velocity $\mathbf{\Omega} = \omega_y\mathbf{j}$.

$$\dot{\mathbf{H}}_G = (\dot{\mathbf{H}}_G)_{Gxyz} + \mathbf{\Omega}\times\mathbf{H}_G$$

$$= 0 + \omega_y\mathbf{j}\times(\bar{I}_y\omega_y\mathbf{j} + \bar{I}_z\omega_z\mathbf{k})$$

$$= \bar{I}_z\omega_z\omega_y\mathbf{i}$$

$$\dot{\mathbf{H}}_G = (1.11375)(-91.787)(0.17593)\mathbf{i}$$

$$= -(17.985 \text{ N}\cdot\text{m})\mathbf{i}$$

Let O be the point at the center of the axle. For the two wheels plus the axle,

$$\dot{\mathbf{H}}_O = \dot{\mathbf{H}}_G + \dot{\mathbf{H}}_G = -(35.97 \text{ N}\cdot\text{m})\mathbf{i}$$

The distance between the wheels is 1.5 m.

$$\mathbf{M}_O = 1.5\mathbf{k}\times F_y\mathbf{j} = -1.5F_y\mathbf{i}$$

Set $\mathbf{M}_O = \dot{\mathbf{H}}_O$ and solve for F_y.

$$F_y = \frac{-35.97}{-1.5} = 23.98 \text{ N}$$

$\mathbf{F}_y = 24.0 \text{ N}\uparrow$ ◀

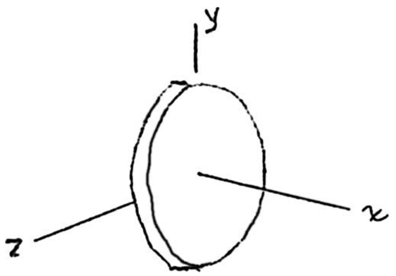
PROBLEM 18.84

The essential structure of a certain type of aircraft turn indicator is shown. Each spring has a constant of 500 N/m, and the 200-g uniform disk of 40-mm radius spins at the rate of 10,000 rpm. The springs are stretched and exert equal vertical forces on yoke *AB* when the airplane is traveling in a straight path. Determine the angle through which the yoke will rotate when the pilot executes a horizontal turn of 750-m radius to the right at a speed of 800 km/h. Indicate whether Point *A* will move up or down.

SOLUTION

Let the *x* axis lie along the axle *AB* and the *y* axis be vertical.



$$\omega_x = \frac{2\pi(10,000)}{60} = 1047.2 \text{ rad/s}$$

$$v = 800 \text{ km/h} = 222.22 \text{ m/s}$$

$$\rho = 750 \text{ m}$$

$$\omega_y = -\frac{v}{\rho} = -\frac{22.222}{750} = -0.2963 \text{ rad/s}$$

$$\omega_z = 0$$

Angular momentum:
$$\mathbf{H}_G = \bar{I}_x\omega_x\mathbf{i} + \bar{I}_y\omega_y\mathbf{j} + \bar{I}_z\omega_z\mathbf{k}$$
$$= I_x\omega_x\mathbf{i} + I_y\omega_y\mathbf{j}$$

Let the reference frame *Gxyz* be turning about the *y* axis with angular velocity $\mathbf{\Omega} = \omega_y\mathbf{j}$.

$$\dot{\mathbf{H}}_G = (\dot{\mathbf{H}}_G)_{Gxyz} + \mathbf{\Omega}\times\mathbf{H}_G$$
$$= \omega_y\mathbf{j}\times(\bar{I}_x\omega_x\mathbf{i} + \bar{I}_y\omega_y\mathbf{j})$$
$$= -I_x\omega_x\omega_y\mathbf{k}$$

Data for the disk:
$$m = 200 \text{ g} = 0.2 \text{ kg}$$

$$I_x = \frac{1}{2}mr^2$$
$$= \frac{1}{2}(0.2)(0.040)^2$$
$$= 160\times10^{-6} \text{ kg}\cdot\text{m}^2$$

$$\mathbf{M}_G = \dot{\mathbf{H}}_G$$
$$= -(160\times10^{-6})(1047.2)(-0.2963)\mathbf{k}$$
$$= (0.049646 \text{ N}\cdot\text{m})\mathbf{k}$$

PROBLEM 18.84 (Continued)

The spring forces $\mathbf{F}_A$ and $\mathbf{F}_B$ exerted on the yoke provide the couple $\mathbf{M}_G$. The force exerted by spring B is upward.

Let $\qquad \mathbf{F}_B = F\mathbf{j}$

Then $\qquad \mathbf{F}_A = -F\mathbf{j}$

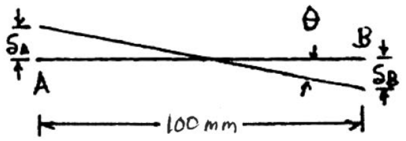
$$\mathbf{M}_G = \mathbf{r}_{B/A}\mathbf{i} \times F\mathbf{j}$$
$$= 0.100\mathbf{i} \times F\mathbf{j}$$
$$= 0.1F\mathbf{k}$$

From $\qquad \mathbf{M}_G = \dot{\mathbf{H}}_G,$

$$0.1F = 0.049646$$
$$F = 0.49646 \text{ N.}$$

Compression of spring B: $\qquad \delta_B = \dfrac{F}{k}$

$$= \frac{0.49646}{500}$$
$$= 0.99291 \times 10^{-3} \text{ m}$$
$$= 0.9929 \text{ mm}$$



Point B moves 0.9929 mm *down*. Point A moves 0.9929 mm *up*.

Turning angle for yoke: $\qquad \theta = \dfrac{0.9929 + 0.9929}{100}$

$$= 0.019858 \text{ rad}$$

$\boldsymbol{\theta} = 1.138°$ ◀

Point A moves *up*. ◀

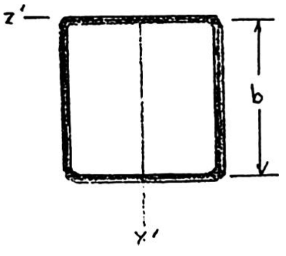
PROBLEM 18.85

A slender rod is bent to form a square frame of side 6 in. The frame is attached by a collar at A to a vertical shaft which rotates with a constant angular velocity $\boldsymbol{\omega}$. Determine the value of ω for which line AB forms an angle $\beta = 48^\circ$ with the horizontal x axis.

SOLUTION

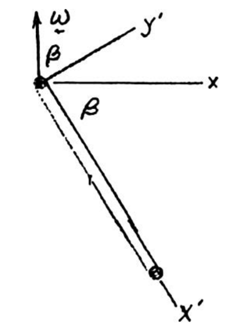


Choose principal axes x', y', z' with origin at the fixed Point A.

$$I_{x'} = 2\left(\frac{m}{4}\right)\left(\frac{1}{12}a^2\right) + 2\left(\frac{m}{4}\right)\left(\frac{a}{2}\right)^2 = \frac{1}{6}ma^2$$

$$I_{z'} = 2\left(\frac{m}{4}\right)\left(\frac{1}{3}a^2\right) + \left(\frac{m}{4}\right)(a)^2 = \frac{5}{12}ma^2$$

$$I_{y'} = I_{x'} + I_{z'} = \frac{7}{12}ma^2$$

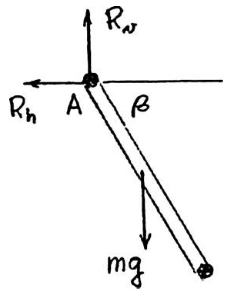


Angular velocity: $\boldsymbol{\omega} = -\omega\sin\beta\mathbf{i}' + \omega\cos\beta\mathbf{j}'$

Angular momentum about A: $\mathbf{H}_A = -I_{x'}\omega\sin\beta\mathbf{i}' + I_{y'}\omega\cos\beta\mathbf{j}'$

Let the reference from $Axyz$ be rotating with angular velocity $\boldsymbol{\Omega} = \boldsymbol{\omega}$.

$$\begin{aligned}\dot{\mathbf{H}}_A &= (\dot{\mathbf{H}}_A)_{Axyz} + \boldsymbol{\Omega}\times\mathbf{H}_A = 0 + \boldsymbol{\omega}\times\mathbf{H}_A \\ &= (-\omega\sin\beta\mathbf{i}' + \omega\cos\beta\mathbf{j}') \\ &\quad \times(-I_{x'}\,\omega\sin\beta\mathbf{i}' + I_{y'}\,\omega\cos\beta\mathbf{j}') \\ &= -(I_y - I_z)\,\omega^2\sin\beta\cos\beta\mathbf{k} \\ &= -\frac{5}{12}ma^2\omega^2\sin\beta\cos\beta\mathbf{k}\end{aligned}$$



$$\Sigma\mathbf{M}_A = -mg\frac{a}{2}\cos\beta\mathbf{k} = \dot{\mathbf{H}}_A$$

$$-mg\frac{a}{2}\cos\beta = -\frac{5}{12}ma^2\omega^2\sin\beta\cos\beta$$

$$\omega^2 = \frac{6}{5}\frac{g}{a\sin\beta} = \frac{(6)(32.2)}{(5)(0.5)\sin 48^\circ} = 103.99\,(\text{rad/s})^3$$

$\omega = 10.20$ rad/s ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. PROBLEM 18.86

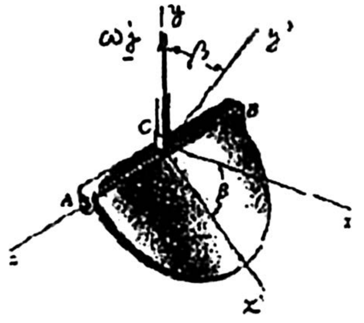
A uniform semicircular plate of radius 120 mm is hinged at A and B to a clevis which rotates with a constant angular velocity $\boldsymbol{\omega}$ about a vertical axis. Determine (*a*) the angle β that the plate forms with the horizontal x axis when $\omega = 15$ rad/s, (*b*) the largest value of ω for which the plate remains vertical ($\beta = 90°$).

SOLUTION

<u>Moments and products of inertia</u>.

We use the axes $Cx'y'z$ shown.

We note that $I_{x'}$ and $I_{y'}$ are half those for a circular plate, and so is the mass m. Thus,



$$I_{x'} = \frac{1}{4}mr^2$$

$$I_{y'} = \frac{1}{2}mr^2$$

Because of symmetry, all products of inertia are equal to zero:

$$I_{x'y'} = I_{y'z} = I_{zx'} = 0$$

<u>Angular momentum about C</u>.

$$\mathbf{H}_C = I_{x'}\omega_{x'}\mathbf{i}' + I_{y'}\omega_{y'}\mathbf{j}'$$

$$= \frac{1}{4}mx^2(-\omega \sin \beta)\mathbf{i}' + \frac{1}{2}mr^2(\omega \cos \beta)\mathbf{j}'$$

$$= \frac{1}{4}mx^2\omega(-\sin \beta\mathbf{i}' + 2 \cos \beta\mathbf{j}')$$

Since C is a fixed point, we can use Equation (18.28):

$$\Sigma\mathbf{M}_C = (\dot{\mathbf{H}}_C)_{Cx'y'z} + \boldsymbol{\Omega} \times \mathbf{H}_C = 0 + \omega\mathbf{j} \times \mathbf{H}_C$$

Or, since $\mathbf{j} = -\mathbf{i}'\sin\beta + \mathbf{j}'\cos\beta$:

$$\Sigma\mathbf{M}_C = \omega(-\mathbf{i}' \sin\beta + \mathbf{j}' \cos\beta) \times \frac{1}{4}mx^2\omega(-\sin\beta\mathbf{i}' + 2\cos\beta\mathbf{j}')$$

$$= \frac{1}{4}mr^2\omega^2(-2\sin\beta\cos\beta\mathbf{k} + \cos\beta\sin\beta\mathbf{k})$$

$$\Sigma\mathbf{M}_C = -\frac{1}{4}mr^2\omega^2 \sin\beta\cos\beta\mathbf{k} \qquad (1)$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. If you are a student using this Manual, you are using it without permission.*

But $$\Sigma \mathbf{M}_C = -mg\overline{x}'\cos\beta\mathbf{k}$$

$$= -mg\frac{4r}{3\pi}\cos\beta\mathbf{k} \qquad (2)$$

Equating (1) and (2): $$\frac{1}{4}mr^2\omega^2\sin\beta\cos\beta = \frac{4mgr}{3\pi}\cos\beta$$

$$\omega^2\sin\beta = \frac{16}{3\pi}\frac{g}{r} = \frac{16}{3\pi}\frac{9.81\text{ m/s}^2}{0.12\text{ m}} \qquad \omega^2\sin\beta = 138.78\text{ s}^{-2} \quad (3)$$

(*a*) Let $\omega = 15$ rad/s in Eq. (3): $$\sin\beta = \frac{138.78}{(15)^2} = 0.61681 \qquad \beta = 38.1° \blacktriangleleft$$

(*b*) Let $\beta = 90°$ in Eq. (3): $$\omega^2 = 138.78\text{ s}^{-2} \qquad \omega = 11.78\text{ rad/s} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 18.87

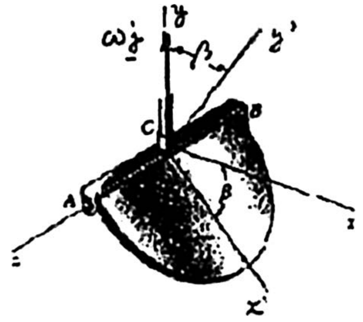
A uniform semicircular plate of radius 120 mm is hinged at A and B to a clevis which rotates with a constant angular velocity $\boldsymbol{\omega}$ about a vertical axis. Determine the value of ω for which the plate forms an angle $\beta = 50°$ with the horizontal x axis.

SOLUTION

<u>Moments and products of inertia</u>.

We use the axes $Cx'y'z$ shown.

We note that $I_{x'}$ and $I_{y'}$ are half those for a circular plate, and so is the mass m. Thus,



$$I_{x'} = \frac{1}{4}mr^2$$

$$I_{y'} = \frac{1}{2}mr^2$$

Because of symmetry, all products of inertia are equal to zero:

$$I_{x'y'} = I_{y'z} = I_{zx'} = 0$$

<u>Angular momentum about C</u>.

$$\mathbf{H}_C = I_{x'}\omega_{x'}\mathbf{i}' + I_{y'}\omega_{y'}\mathbf{j}'$$

$$= \frac{1}{4}mr^2(-\omega\sin\beta)\mathbf{i}' + \frac{1}{2}mr^2(\omega\cos\beta)\mathbf{j}'$$

$$= \frac{1}{4}mr^2\omega(-\sin\beta\mathbf{i}' + 2\cos\beta\mathbf{j}')$$

Since C is a fixed point, we can use Equation (18.28):

$$\Sigma\mathbf{M}_C = (\dot{\mathbf{H}}_C)_{Cx'y'z} + \boldsymbol{\Omega}\times\mathbf{H}_C$$

$$= 0 + \omega\mathbf{j}\times\mathbf{H}_C$$

Or, since $\mathbf{j} = -\mathbf{i}'\sin\beta + \mathbf{j}'\cos\beta$:

$$\Sigma\mathbf{M}_C = \omega(-\mathbf{i}'\sin\beta + \mathbf{j}'\cos\beta)\times\frac{1}{4}mr^2\omega(-\sin\beta\mathbf{i}' + 2\cos\beta\mathbf{j}')$$

$$= \frac{1}{4}mr^2\omega^2(-2\sin\beta\cos\beta\mathbf{k} + \cos\beta\sin\beta\mathbf{k})$$

$$\Sigma\mathbf{M}_C = -\frac{1}{4}mr^2\omega^2\sin\beta\cos\beta\mathbf{k} \qquad (1)$$

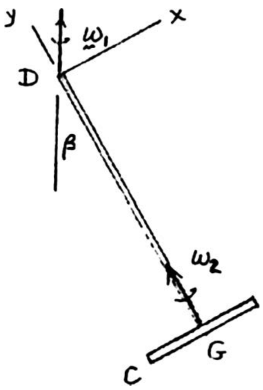
PROBLEM 18.90

The 950-g gear A is constrained to roll on the fixed gear B, but is free to rotate about axle AD. Axle AD, of length 400 mm and negligible mass, is connected by a clevis to the vertical shaft DE, which rotates as shown with a constant angular velocity $\boldsymbol{\omega}_1$. Assuming that gear A can be approximated by a thin disk of radius 80 mm, determine the largest allowable value of ω_1 if gear A is not to lose contact with gear B.

SOLUTION

$$\beta = 30°$$
$$L = 400 \text{ mm} = 0.4 \text{ m}$$
$$r = 80 \text{ mm} = 0.08 \text{ m}$$

Choose principal axes x, y, z as shown.



Kinematics:

$$\boldsymbol{\omega}_1 = \omega_1 \sin\beta \mathbf{i} + \omega_1 \cos\beta \mathbf{j}$$
$$\boldsymbol{\omega}_2 = \omega_2 \mathbf{j}$$
$$\boldsymbol{\omega} = \boldsymbol{\omega}_1 + \boldsymbol{\omega}_2$$
$$= \omega_1 \sin\beta \mathbf{i} + (\omega_1 \cos\beta + \omega_2)\mathbf{j}$$
$$\omega_x = \omega_1 \sin\beta$$
$$\omega_y = \omega_1 \cos\beta + \omega_2$$
$$\mathbf{v}_G = \boldsymbol{\omega}_1 \times \mathbf{r}_{G/D} = \boldsymbol{\omega}_1 \mathbf{j} \times \mathbf{r}_{G/D}$$
$$= -\omega_1 L \sin\beta \mathbf{k}$$
$$\mathbf{a}_G = \boldsymbol{\omega}_1 \times \mathbf{v}_G = \omega_1^2 L \sin\beta \longleftarrow$$
$$\mathbf{v}_C = \mathbf{v}_G + \boldsymbol{\omega} \times \mathbf{r}_{C/G}$$
$$0 = -\omega_1 L \sin\beta \mathbf{k} + (\omega_x \mathbf{i} + \omega_y \mathbf{j}) \times (-r\mathbf{i})$$
$$= -\omega_1 L \sin\beta \mathbf{k} + \omega_y r \mathbf{k}$$
$$\omega_y = \omega_1 \frac{L}{r} \sin\beta$$

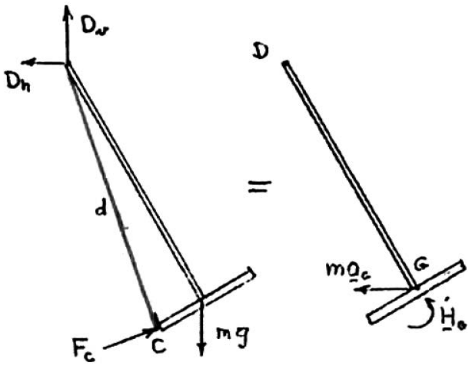
Angular momentum:

$$\mathbf{H}_G = \bar{I}_x \omega_x \mathbf{i} + \bar{I}_y \omega_y \mathbf{j}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

Let the reference frame *Dxyz* be rotating with angular velocity $\boldsymbol{\Omega} = \boldsymbol{\omega}_1$.

$$\begin{aligned}\dot{\mathbf{H}}_G &= (\dot{\mathbf{H}}_G)_{Gxyz} + \boldsymbol{\Omega}\times\mathbf{H}_G \\ &= 0 + (\omega_1 \sin\beta\mathbf{i} + \omega_1\cos\beta\mathbf{j})\times(\bar{I}_x\omega_x\mathbf{i} + \bar{I}_y\omega_y\mathbf{j}) \\ &= (\bar{I}_y\omega_y\omega_1\sin\beta - \bar{I}_x\omega_x\omega_1\cos\beta)\mathbf{k} \\ &= \left(\frac{1}{2}mr^2\omega_y\sin\beta - \frac{1}{4}mr^2\omega_x\cos\beta\right)\omega_1\mathbf{k}\end{aligned}$$



Moments about *D*: $\mathbf{M}_D = Fd\mathbf{k} - mgL\sin\beta\mathbf{k}$

where $d = (DC) = \sqrt{L^2 + r^2}$

$$\begin{aligned}(\mathbf{M}_D)_{\text{eff}} &= \dot{\mathbf{H}}_G + \mathbf{r}_{G/D}\times m\mathbf{a}_G \\ &= \dot{\mathbf{H}}_G + m\omega_1^2L^2\sin\beta\cos\beta\mathbf{k}\end{aligned}$$

Equating $\mathbf{M}_D = (\mathbf{M}_D)_{\text{eff}}$ and taking the *z* component,

$$\begin{aligned}F_Cd - mgL\sin\beta &= \left(\frac{1}{2}mr^2\frac{L}{r}\sin^2\beta - \frac{1}{4}mr^2\sin\beta\cos\beta\right)\omega_1^2 + m\omega_1^2L^2\sin\beta\cos\beta \\ &= m\omega_1^2\sin\beta\left(\frac{1}{2}rL\sin\beta - \frac{1}{4}r^2\cos\beta - L^2\cos\beta\right)\end{aligned}$$

Set $F_C = 0$ and solve for ω_1^2:

$$\begin{aligned}\omega_1^2 &= \frac{gL}{L^2\cos\beta + \frac{1}{4}r^2\cos\beta - \frac{1}{2}rL\sin\beta} \\ &= \frac{(9.81)(0.4)}{(0.4)^2\cos 30° + \frac{1}{4}(0.08)^2\cos 30° - \frac{1}{2}(0.08)(0.4)\sin 30°} \\ &= 29.739\end{aligned}$$

$\omega_2 = 5.45$ rad/s ◀

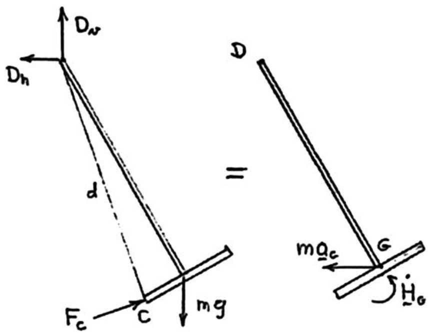
PROBLEM 18.91 (Continued)

Let the reference frame $Dxyz$ be rotating with angular velocity $\mathbf{\Omega} = \boldsymbol{\omega}_1$.

$$\begin{aligned}\dot{\mathbf{H}}_G &= (\dot{\mathbf{H}}_G)_{Gxyz} + \mathbf{\Omega} \times \mathbf{H}_G \\ &= 0 + (\omega_1 \sin\beta \mathbf{i} + \omega_1 \cos\beta \mathbf{j}) \times (\bar{I}_x \omega_x \mathbf{i} + \bar{I}_y \omega_y \mathbf{j}) \\ &= (\bar{I}_y \omega_y \omega_1 \sin\beta - \bar{I}_x \omega_x \omega_1 \cos\beta)\mathbf{k} \\ &= \left(\frac{1}{2} m r^2 \omega_y \sin\beta - \frac{1}{4} m r^2 \omega_x \cos\beta\right)\omega_1 \mathbf{k}\end{aligned}$$



Moments about D: $\mathbf{M}_D = Fd\mathbf{k} - mgL\sin\beta\mathbf{k}$

where $d = (DC) = \sqrt{L^2 + r^2}$

$$(\mathbf{M}_D)_{\text{eff}} = \dot{\mathbf{H}}_G + \mathbf{r}_{G/D} \times m\mathbf{a}_G = \dot{\mathbf{H}}_G + m\omega_1^2 L^2 \sin\beta \cos\beta \mathbf{k}$$

Equating $\mathbf{M}_D = (\mathbf{M}_D)_{\text{eff}}$ and taking the z component,

$$\begin{aligned}F_C d - mgL\sin\beta &= \left(\frac{1}{2} m r^2 \frac{L}{r} \sin^2\beta - \frac{1}{4} m r^2 \sin\beta\cos\beta\right)\omega_1^2 + m\omega_1^2 L^2 \sin\beta\cos\beta \\ &= m\omega_1^2 \sin\beta \left(\frac{1}{2} rL\sin\beta - \frac{1}{4} r^2 \cos\beta - L^2\cos\beta\right)\end{aligned}$$

Solving for F_C, $$F_C = \frac{m\sin\beta}{d}\left[gL - \omega_1^2\left(L^2\cos\beta + \frac{1}{4} r^2 \cos\beta - \frac{1}{2} rL\sin\beta\right)\right]$$

Additional data: $m = 950g = 0.95 \text{ kg}, \quad \omega_1 = 4 \text{ rad/s}$

$$d = \sqrt{(0.4)^2 + (0.08)^2} = 0.40792 \text{ m}$$

$$\begin{aligned}F_C &= \frac{(0.95)\sin 30^\circ}{0.40792}\left\{(9.81)(0.4) - (4)^2\left[(0.4)^2\cos 30^\circ + \frac{1}{4}(0.08)^2\cos 30^\circ - \frac{1}{2}(0.4)(0.08)\sin 30^\circ\right]\right\} \\ &= 2.11 \text{ N}\end{aligned}$$

$$\alpha = \beta - \tan^{-1}\frac{r}{L} = 30^\circ - \tan^{-1}\left(\frac{4}{20}\right)$$

$\alpha = 18.7^\circ$ $\qquad$ **2.11 N $\measuredangle$ 18.7°** ◀

PROBLEM 18.92

The essential structure of a certain type of aircraft turn indicator is shown. Springs *AC* and *BD* are initially stretched and exert equal vertical forces at *A* and *B* when the airplane is traveling in a straight path. Each spring has a constant of 600 N/m and the uniform disk has a mass of 250 g and spins at the rate of 12,000 rpm. Determine the angle through which the yoke will rotate when the pilot executes a horizontal turn of 800-m radius to the right at a speed of 720 km/h. Indicate whether point *A* will move up or down.

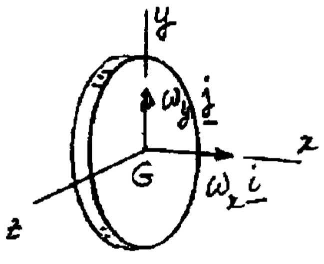
SOLUTION

Aircraft speed: $v = 720 \text{ km/h} = 200 \text{ m/s}$

Radius of turn: $\rho = 800 \text{ m}$

Angular velocity: $\omega_x = 12000 \text{ rpm} = 1256.6 \text{ rad/s}$

ω_y is negative since the aircraft is turning to the right.



$$\omega_y = -\frac{v}{\rho} = -\frac{200 \text{ m/s}}{800 \text{ m}} = -0.25 \text{ rad/s}$$

$$\omega_z = 0$$

Angular momentum: $\mathbf{H}_G = \bar{I}_x \omega_x \mathbf{i} + \bar{I}_y \omega_y \mathbf{j}$

where the reference frame *Gxyz* is turning with the aircraft with an angular velocity

$$\mathbf{\Omega} = \omega_y \mathbf{j}$$

Rate of change of angular momentum:

Since ω_x and ω_y are constant, $(\dot{\mathbf{H}}_G)_{Gxyz} = 0$ and Eq. (18.22) yields

$$\dot{\mathbf{H}}_G = (\dot{\mathbf{H}}_G)_{Gxyz} + \mathbf{\Omega} \times \mathbf{H}_G = 0 + \omega_y \mathbf{j} \times (\bar{I}_x \omega_x \mathbf{i} + \bar{I}_y \omega_y \mathbf{j})$$

$$= -\bar{I}_x \omega_x \omega_y \mathbf{k} = -\left(\frac{1}{2} m r^2\right) \omega_x \omega_y \mathbf{k}$$

$$= -\frac{1}{2}(0.25 \text{ kg})(0.05 \text{ m})^2 (1256.6 \text{ rad/s})(-0.250 \text{ rad/s})\mathbf{k}$$

$$\dot{\mathbf{H}}_G = +(98.172 \times 10^{-3} \text{ N} \cdot \text{m})\mathbf{k}$$

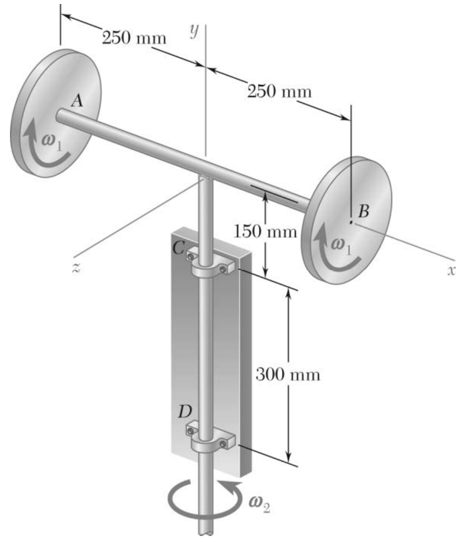
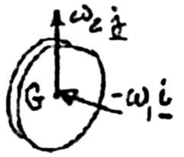
PROBLEM 18.95



Two disks, each of mass 5 kg and radius 100 mm, spin as shown at the rate $\omega_1 = 1500$ rpm about a rod *AB* of negligible mass which rotates about a vertical axis at the rate $\omega_2 = 45$ rpm. (*a*) Determine the dynamic reactions at *C* and *D*. (*b*) Solve part *a*, assuming that the direction of spin of disk *B* is reversed.

SOLUTION

Angular momentum of each disk about its mass center.



$$\mathbf{H}_G = \bar{I}_x\omega_x\mathbf{i} + \bar{I}_y\omega_y\mathbf{j} = -\frac{1}{2}mr^2\omega_1\mathbf{i} + \frac{1}{4}mr^2\omega_2\mathbf{j}$$

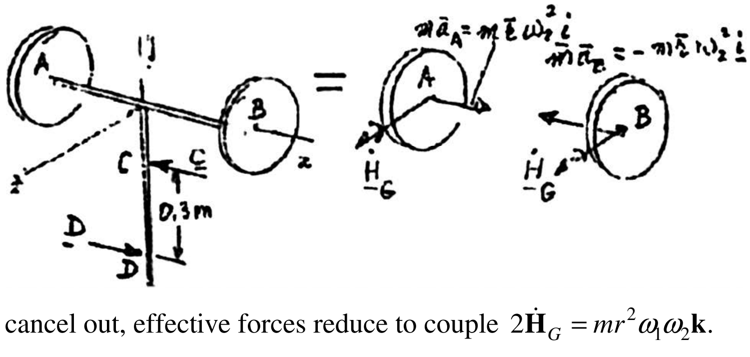
$$\mathbf{H}_G = \frac{1}{4}mr^2(-2\omega_1\mathbf{i} + \omega_2\mathbf{j}) \qquad (1)$$

Eq. (18.22):

$$\dot{\mathbf{H}}_G = (\dot{\mathbf{H}}_G)_{Gxyz} + \mathbf{\Omega}\times\mathbf{H}_G = 0 + \omega_2\mathbf{j}\times\frac{1}{4}mr^2(-2\omega_1\mathbf{i} + \omega_2\mathbf{j})$$

$$\dot{\mathbf{H}}_B = +\frac{1}{2}mr^2\omega_1\omega_2\mathbf{k} \qquad (2)$$

Equations of motion.



Since $m\bar{\mathbf{a}}_A$ and $m\bar{\mathbf{a}}_B$ cancel out, effective forces reduce to couple $2\dot{\mathbf{H}}_G = mr^2\omega_1\omega_2\mathbf{k}$.

It follows that the reactions form an equivalent couple with

$$-\mathbf{C} = \mathbf{D} = \left(\frac{mr^2\omega_1\omega_2}{0.3\text{ m}}\right)\mathbf{i} \qquad (3)$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 18.98 (Continued)

Taking moments about A:

$$R\mathbf{i} \times (-D\mathbf{j} - W\mathbf{j}) = \dot{\mathbf{H}}_G$$

$$\frac{20}{12}\mathbf{i} \times (-D\mathbf{j} - 8\mathbf{j}) = -48.52\mathbf{k}$$

$$-\frac{5}{3}(D+8)\mathbf{k} = -48.52\mathbf{k}$$

$$D = \frac{3}{5}(48.52) - 8 = 21.1 \text{ lb}$$

$\mathbf{D} = 21.1 \text{ lb}\downarrow$ ◀

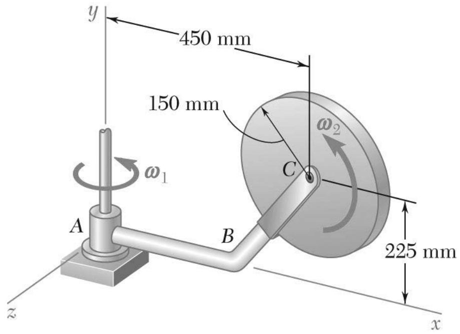
PROBLEM 18.99



A thin disk of mass $m = 4$ kg rotates with an angular velocity ω_2 with respect to arm *ABC*, which itself rotates with an angular velocity ω_1 about the *y* axis. Knowing that $\omega_1 = 5$ rad/s and $\omega_2 = 15$ rad/s and that both are constant, determine the force-couple system representing the dynamic reaction at the support at *A*.

SOLUTION

Angular velocity of the disk. $\boldsymbol{\omega} = \omega_1\mathbf{j} + \omega_2\mathbf{k} = (5 \text{ rad/s})\mathbf{j} + (15 \text{ rad/s})\mathbf{k}$

Moments of inertia about principal axes passing through the mass center.

$$\bar{I}_{x'} = \bar{I}_{y'} = \frac{1}{4}mr^2$$

$$= \frac{1}{4}(4)(0.150 \text{ m})^2 = 0.0225 \text{ kg}\cdot\text{m}^2$$

$$\bar{I}_{z'} = \frac{1}{2}mr^2 = 0.045 \text{ kg}\cdot\text{m}^2$$

Angular momentum about mass center C.

$$\mathbf{H}_C = \bar{I}_{x'}\omega_{x'}\mathbf{i} + \bar{I}_{y'}\omega_{y'}\mathbf{j} + \bar{I}_{z'}\omega_{z'}\mathbf{k}$$

$$= 0 + (0.0225)5\mathbf{j} + (0.045)15\mathbf{k}$$

$$\mathbf{H}_C = (0.1125 \text{ kg}\cdot\text{m}^2/\text{s})\mathbf{j} + (0.6750 \text{ kg}\cdot\text{m}^2/\text{s})\mathbf{k}$$

Rate of change of $\mathbf{H}_C$. Let the frame *Axyz* be turning with angular velocity $\boldsymbol{\Omega} = \omega_1\mathbf{j}$.

$$\dot{\mathbf{H}}_C = (\dot{\mathbf{H}}_C)_{Axyz} + \boldsymbol{\Omega}\times\mathbf{H}_C = 0 + \boldsymbol{\Omega}\times\mathbf{H}_C$$

$$= 5\mathbf{j}\times(0.1125\mathbf{j} + 0.675\mathbf{k}) = (3.375 \text{ N}\cdot\text{m})\mathbf{i}$$

Position vector of Point C.

$$\mathbf{r}_{C/A} = (0.450 \text{ m})\mathbf{i} + (0.225 \text{ m})\mathbf{j}$$

Velocity of Point C, the mass center of the disk.

$$\mathbf{v}_C = \omega_1\times\mathbf{r}_{C/A} = 5\mathbf{j}\times(0.45\mathbf{i} + 0.225\mathbf{j})$$

$$= -(2.25 \text{ m/s})\mathbf{k}$$

Acceleration of Point C.

$$\mathbf{a}_C = \alpha_1\mathbf{j}\times\mathbf{r}_{C/A} + \omega_1\mathbf{j}\times\mathbf{v}_C = 0 + 5\mathbf{j}\times(-2.25\mathbf{k}) = -(11.25 \text{ m/s}^2)\mathbf{i}$$

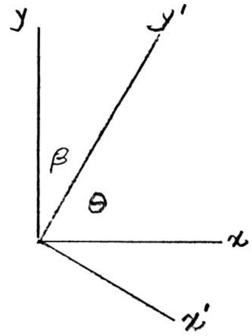
PROBLEM 18.100

An experimental Fresnel-lens solar-energy concentrator can rotate about the horizontal axis *AB*, which passes through its mass center *G*. It is supported at *A* and *B* by a steel framework, which can rotate about the vertical *y* axis. The concentrator has a mass of 30 Mg, a radius of gyration of 12 m about its axis of symmetry *CD*, and a radius of gyration of 10 m about any transverse axis through *G*. Knowing that the angular velocities ω_1 and ω_2 have constant magnitudes equal to 0.20 rad/s and 0.25 rad/s, respectively, determine for the position $\theta = 60°$ (*a*) the forces exerted on the concentrator at *A* and *B*, (*b*) the couple $M_2\mathbf{k}$ applied to the concentrator at that instant.

SOLUTION

Let the *y* axis be vertical and the y' axis be the symmetry axis.

Let the *z* axis be directed along axle *BA* as shown and the x' axis be the transverse axis perpendicular to *BA*.



Unit vectors.

$$\beta = 90° - \theta$$
$$\mathbf{i}' = \mathbf{i}\cos\beta - \mathbf{j}\sin\beta$$
$$\mathbf{j}' = \mathbf{i}\sin\beta + \mathbf{j}\cos\beta$$
$$\mathbf{i} = \mathbf{i}'\cos\beta + \mathbf{j}'\sin\beta$$
$$\mathbf{j} = -\mathbf{i}'\sin\beta + \mathbf{j}\cos\beta$$

Angular velocity.

$$\boldsymbol{\omega} = \omega_2\mathbf{j} + \omega_1\mathbf{k}$$
$$\omega = -(\omega_2 \sin\beta)\mathbf{i}' + (\omega_2\cos\beta)\mathbf{j}' + \omega_1\mathbf{k}$$
$$= -\omega_2\cos\theta\mathbf{i} + \omega_2\sin\theta\mathbf{j} + \omega_1\mathbf{k}$$

$$\omega_{x'} = \omega_2\cos\theta \qquad \omega_{y'} = \omega_2 \sin\theta \qquad \omega_z = \omega_1$$

$\dot{\theta} = \omega_1$ $\qquad \omega_1$ and ω_2 are constant.

$$\dot{\omega}_{x'} = \omega_2\omega_1\sin\theta$$
$$\dot{\omega}_{y'} = \omega_2\omega_1\cos\theta, \quad \dot{\omega}_2 = 0$$

Radii of gyration:

$$k_{x'} = 10 \text{ m}$$
$$k_{y'} = 12 \text{ m}$$
$$k_z = 10 \text{ m}$$

Moments of inertia:

$$I = mk^2$$

PROBLEM 18.101

A 6-lb homogeneous disk of radius 3 in. spins as shown at the constant rate $\omega_1 = 60$ rad/s. The disk is supported by the fork-ended rod *AB*, which is welded to the vertical shaft *CBD*. The system is at rest when a couple $\mathbf{M}_0 = (0.25\text{ ft}\cdot\text{lb})\mathbf{j}$ is applied to the shaft for 2 s and then removed. Determine the dynamic reactions at *C* and *D* after the couple has been removed.

SOLUTION

Angular velocity of shaft *CBD* and arm *AB*: $\boldsymbol{\Omega} = \omega_2\mathbf{j}$

Angular velocity of disk *A*: $\boldsymbol{\omega} = \omega_2\mathbf{j} + \omega_1\mathbf{k}$

Its angular momentum about *A*: $\mathbf{H}_A = \bar{I}_x\omega_x\mathbf{i} + \bar{I}_y\omega_y\mathbf{j} + \bar{I}_z\omega_z\mathbf{k} = \bar{I}_y\omega_2\mathbf{j} + \bar{I}_z\omega_1\mathbf{k}$

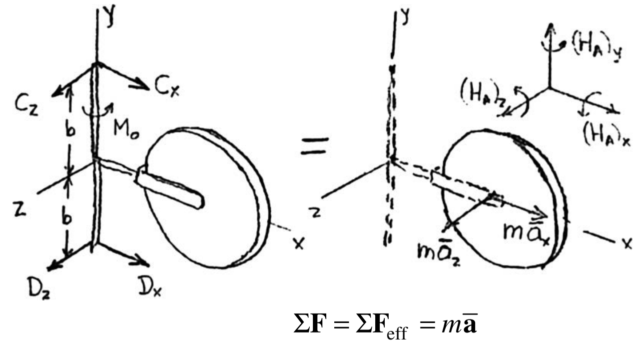
Let the reference frame *Bxyz* be rotating with angular velocity $\boldsymbol{\Omega}$.

$$\begin{aligned}\dot{\mathbf{H}}_A &= (\dot{\mathbf{H}}_A)_{Axyz} + \boldsymbol{\Omega}\times\mathbf{H}_A \\ &= \bar{I}_y\dot{\omega}_2\mathbf{j} + \bar{I}_z\dot{\omega}_1\mathbf{k} + \omega_2\mathbf{j}\times(\bar{I}_y\omega_2\mathbf{j} + \bar{I}_z\omega_1\mathbf{k}) \\ &= \bar{I}_z\omega_1\omega_2\mathbf{i} + \bar{I}_y\dot{\omega}_2\mathbf{j} + \bar{I}_z\dot{\omega}_1\mathbf{k} \\ &= \frac{1}{2}mr^2\omega_1\omega_2\mathbf{i} + \frac{1}{4}mr^2\dot{\omega}_2\mathbf{j} + \frac{1}{2}mr^2\dot{\omega}_1\mathbf{k}\end{aligned}$$

Velocity and acceleration of the mass center *A* of the disk:

$$\bar{\mathbf{v}} = \omega_2\mathbf{j}\times c\mathbf{i} = -c\omega_2\mathbf{k},$$

$$\bar{\mathbf{a}} = \dot{\omega}_2\mathbf{j}\times c\mathbf{i} + \omega_2\mathbf{j}\times\bar{\mathbf{v}} = -c\dot{\omega}_2\mathbf{k} - c\omega_2^2\mathbf{i}$$



$$\Sigma\mathbf{F} = \Sigma\mathbf{F}_{\text{eff}} = m\bar{\mathbf{a}}$$

$$C_x\mathbf{i} + C_y\mathbf{k} + D_x\mathbf{i} + D_z\mathbf{k} = m\bar{\mathbf{a}}$$

Resolve into components.

$$C_x + D_x = -mc\omega_2^2$$

$$C_z + D_z = -mc\dot{\omega}_2$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. If you are a student using this Manual, you are using it without permission.*

$$\Sigma \mathbf{M}_D = \dot{\mathbf{H}}_D = \dot{\mathbf{H}}_A + \mathbf{r}_{A/D} \times m\bar{\mathbf{a}}$$

$$= \dot{\mathbf{H}}_A + (c\mathbf{i} + b\mathbf{j}) \times (-c\dot{\omega}_2\mathbf{k} - c\omega_2^2\mathbf{i})$$

$$M_0\mathbf{j} + 2b\mathbf{j} \times (C_x\mathbf{i} + C_z\mathbf{k}) = \dot{\mathbf{H}}_A - mbc\dot{\omega}_2\mathbf{i} + mc^2\dot{\omega}_2\mathbf{j} + mbc\omega_2^2\mathbf{k}$$

$$2bC_z\mathbf{i} + M_0\mathbf{j} - 2bC_x\mathbf{k} = m\left(\frac{1}{2}r^2\omega_1\omega_2 - bc\dot{\omega}_2\right)\mathbf{i} + m\left(\frac{1}{4}r^2 + c^2\right)\dot{\omega}_2\mathbf{j} + m\left(\frac{1}{2}r^2\dot{\omega}_1 + bc\omega_2^2\right)\mathbf{k}$$

$$\mathbf{j}: \quad M_0 = m\left(\frac{1}{4}r^2 + c^2\right)\dot{\omega}_2 \qquad (1)$$

$$\mathbf{k}: \quad C_x = -\frac{m}{2b}\left(\frac{1}{2}r^2\dot{\omega}_1 + bc\omega_2^2\right) \quad D_x = -\frac{m}{2b}\left(-\frac{1}{2}r^2\dot{\omega}_1 + bc\omega_2^2\right) \qquad (2)$$

$$\mathbf{i}: \quad C_z = \frac{m}{2b}\left(\frac{1}{2}r^2\omega_1\omega_2 - bc\dot{\omega}_2\right) \quad D_z = -\frac{m}{2b}\left(\frac{1}{2}r^2\omega_1\omega_2 + bc\dot{\omega}_2\right) \qquad (3)$$

Data: $W = 6 \text{ lb}, \quad r = 3 \text{ in.} = 0.25 \text{ ft}, \quad b = 4 \text{ in.} = 0.33333 \text{ ft},$
$c = 5 \text{ in.} = 0.41667 \text{ ft}, \quad \omega_1 = 60 \text{ rad/s}, \quad \dot{\omega}_1 = 0$

While the couple is applied, $M_0 = 0.25 \text{ ft} \cdot \text{lb}$

Rearranging Equation (1)

$$\dot{\omega}_2 = \frac{M_0}{m\left(\frac{1}{4}r^2 + c^2\right)} = \frac{0.25}{\left(\frac{6}{32.2}\right)\left[\frac{1}{4}(0.25)^2 + (0.41667)^2\right]} = 7.0899 \text{ rad/s}^2$$

At $t = 2\text{s}$, $\omega_2 = (\omega_2)_0 + \dot{\omega}_2 t = 0 + (7.0899)(2) = 14.18 \text{ rad/s}$

For $t > 2\text{s}$, $M_0 = 0, \quad \dot{\omega}_2 = 0$

From Equations (2), (3)

$$C_x = \frac{\frac{6}{32.2}}{(2)(0.33333)}[0 + (0.33333)(0.41667)(14.1798)^2] = -7.8054 \text{ lb}$$

$$D_x = \frac{\frac{6}{32.2}}{(2)(0.33333)}[0 + (0.33333)(0.41667)(14.1798)^2] = -7.8054 \text{ lb}$$

$$C_z = \frac{\frac{6}{32.2}}{(2)(0.33333)}\left[\frac{1}{2}(0.25)^2(60)(14.1798) - 0\right] = 7.4312 \text{ lb}$$

$$D_z = \frac{\frac{6}{32.2}}{(2)(0.33333)}\left[-\frac{1}{2}(0.25)^2(60)(14.1798) - 0\right] = -7.4312 \text{ lb}$$

$$\mathbf{C} = -(7.81 \text{ lb})\mathbf{i} + (7.43 \text{ lb})\mathbf{k} \blacktriangleleft$$

$$\mathbf{D} = -(7.81 \text{ lb})\mathbf{i} - (7.43 \text{ lb})\mathbf{k} \blacktriangleleft$$

$$\mathbf{i}: \quad C_z = \frac{m}{2b}\left(\frac{1}{2}r^2\omega_1\omega_2 - bc\dot{\omega}_2\right) \quad D_z = -\frac{m}{2b}\left(\frac{1}{2}r^2\omega_1\omega_2 + bc\dot{\omega}_2\right) \qquad (3)$$

Data: $W = 6$ lb, $r = 3$ in. $= 0.25$ ft, $b = 4$ in. $= 0.33333$ ft,
$c = 5$ in. $= 0.41667$ ft, $\omega_1 = 60$ rad/s, $\dot{\omega}_1 = 0$

(*a*) While the couple is applied $\dot{\omega}_2 = \frac{\omega_2}{t} = \frac{18}{3} = 6 \text{ rad/s}^2$

From Equation (1) $\quad M_0 = m\left(\frac{1}{4}r^2 + c^2\right)\dot{\omega}_2$

$$= \left(\frac{6}{32.2}\right)\left[\frac{1}{4}(0.25)^2 + (0.41667)^2\right](6) \qquad M_0 = (0.212 \text{ ft}\cdot\text{lb})\mathbf{j} \blacktriangleleft$$

(*b*) For $t > 3$ s, $\quad M_0 = 0, \quad \dot{\omega}_2 = 0$

From Equations (2), (3)

$$C_x = \frac{\frac{6}{32.2}}{(2)(0.33333)}[0 + (0.33333)(0.41667)(18)^2] = -12.578 \text{ lb}$$

$$D_x = \frac{\frac{6}{32.2}}{(2)(0.33333)}[0 + (0.33333)(0.41667)(18)^2] = -12.578 \text{ lb}$$

$$C_z = \frac{\frac{6}{32.2}}{(2)(0.33333)}\left[\frac{1}{2}(0.25)^2(60)(18) - 0\right] = 9.4332 \text{ lb}$$

$$D_z = \frac{\frac{6}{32.2}}{(2)(0.33333)}\left[-\frac{1}{2}(0.25)^2(60)(18) - 0\right] = -9.4332 \text{ lb}$$

$$\mathbf{C} = -(12.58 \text{ lb})\mathbf{i} + (9.43 \text{ lb})\mathbf{k} \blacktriangleleft$$

$$\mathbf{D} = -(12.58 \text{ lb})\mathbf{i} - (9.43 \text{ lb})\mathbf{k} \blacktriangleleft$$

PROBLEM 18.103

A 2.5 kg homogeneous disk of radius 80 mm rotates with an angular velocity $\boldsymbol{\omega}_1$ with respect to arm *ABC*, which is welded to a shaft *DCE* rotating as shown at the constant rate $\omega_2 = 12$ rad/s. Friction in the bearing at *A* causes ω_1 to decrease at the rate of 15 rad/s^2. Determine the dynamic reactions at *D* and *E* at a time when ω_1 has decreased to 50 rad/s.

SOLUTION

Angular velocity of shaft *DCE* and arm *CBA*: $\boldsymbol{\Omega} = \omega_2 \mathbf{k}$

Angular velocity of disk *A*: $\boldsymbol{\omega} = \omega_1 \mathbf{j} + \omega_2 \mathbf{k}$

Its angular momentum about *A*: $\mathbf{H}_A = \bar{I}_x \omega_x \mathbf{i} + \bar{I}_y \omega_y \mathbf{j} + \bar{I}_z \omega_z \mathbf{k} = \bar{I}_y \omega_1 \mathbf{j} + \bar{I}_z \omega_2 \mathbf{k}$

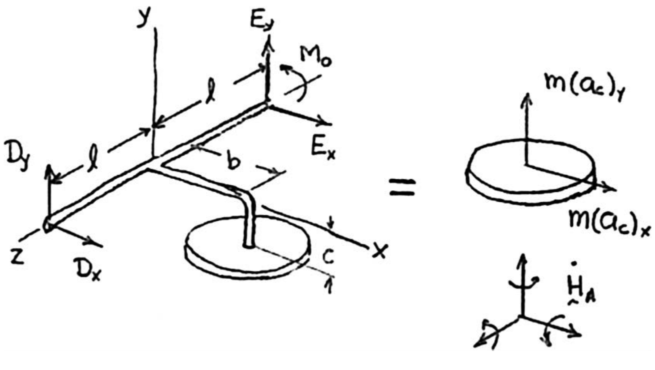
Let the reference frame *Cxyz* be rotating with angular velocity $\boldsymbol{\Omega}$.

$$\begin{aligned}\dot{\mathbf{H}}_A &= (\dot{\mathbf{H}}_A)_{Axyz} + \boldsymbol{\Omega} \times \mathbf{H}_A \\ &= \bar{I}_y \dot{\omega}_1 \mathbf{j} + \bar{I}_z \dot{\omega}_2 \mathbf{k} + \omega_2 \mathbf{k} \times (\bar{I}_y \omega_1 \mathbf{j} + \bar{I}_z \omega_2 \mathbf{k}) \\ &= -\bar{I}_y \omega_2 \omega_1 \mathbf{i} + \bar{I}_y \dot{\omega}_1 \mathbf{j} + \bar{I}_z \dot{\omega}_2 \mathbf{k} \\ &= -\frac{1}{2} m r^2 \omega_2 \omega_1 \mathbf{i} + \frac{1}{2} m r^2 \dot{\omega}_1 \mathbf{j} + \frac{1}{4} m r^2 \dot{\omega}_2 \mathbf{k}\end{aligned}$$

Velocity and acceleration of the mass center *A* of the disk:

$$\mathbf{v}_A = \boldsymbol{\omega}_2 \mathbf{k} \times \mathbf{r}_{A/C} = \omega_2 \mathbf{k} \times (b\mathbf{i} - c\mathbf{j}) = c\omega_2 \mathbf{i} + b\omega_2 \mathbf{j}$$

$$\mathbf{a}_A = \dot{\omega}_2 \mathbf{k} \times \mathbf{r}_{A/C} + \omega_2 \mathbf{k} \times \mathbf{v}_A = (c\dot{\omega}_2 - b\omega_2^2)\mathbf{i} + (b\dot{\omega}_2 + c\omega_2^2)\mathbf{j}$$



$$\Sigma \mathbf{F} = \Sigma \mathbf{F}_{\text{eff}}$$

$$D_x \mathbf{i} + D_y \mathbf{j} + E_x \mathbf{i} + E_y \mathbf{j} = m\mathbf{a}_A$$

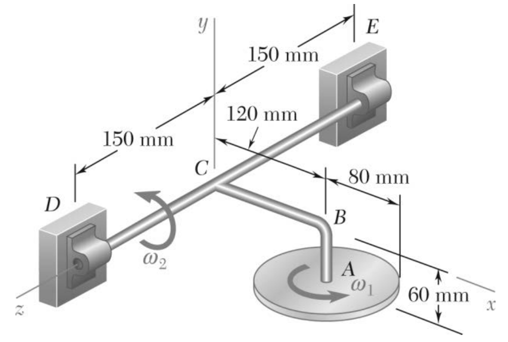
PROBLEM 18.104



A 2.5-kg homogeneous disk of radius 80 mm rotates at the constant rate $\omega_1 = 50$ rad/s with respect to arm *ABC*, which is welded to a shaft *DCE*. Knowing that at the instant shown shaft *DCE* has an angular velocity $\omega_2 = (12 \text{ rad/s})\mathbf{k}$ and an angular acceleration $\alpha_2 = (8 \text{ rad/s}^2)\mathbf{k}$, determine (*a*) the couple which must be applied to shaft *DCE* to produce that acceleration, (*b*) the corresponding dynamic reactions at *D* and *E*.

SOLUTION

Angular velocity of shaft *DCE* and arm *CBA*: $\mathbf{\Omega} = \omega_2\mathbf{k}$

Angular velocity of disk *A*: $\boldsymbol{\omega} = \omega_1\mathbf{j} + \omega_2\mathbf{k}$

Its angular momentum about *A*: $\mathbf{H}_A = \bar{I}_x\omega_x\mathbf{i} + \bar{I}_y\omega_y\mathbf{j} + \bar{I}_z\omega_z\mathbf{k} = \bar{I}_y\omega_1\mathbf{j} + \bar{I}_z\omega_2\mathbf{k}$

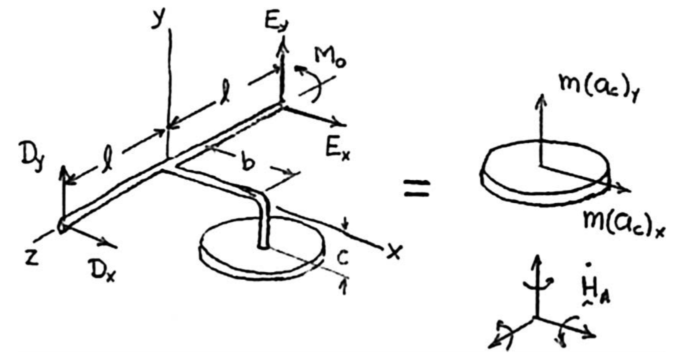
Let the reference frame *Cxyz* be rotating with angular velocity $\mathbf{\Omega}$.

$$\begin{aligned}\dot{\mathbf{H}}_A &= (\dot{\mathbf{H}}_A)_{Axyz} + \mathbf{\Omega}\times\mathbf{H}_A \\ &= \bar{I}_y\dot{\omega}_1\mathbf{j} + \bar{I}_z\dot{\omega}_2\mathbf{k} + \omega_2\mathbf{k}\times(\bar{I}_y\omega_1\mathbf{j} + \bar{I}_z\omega_2\mathbf{k}) \\ &= -\bar{I}_y\omega_2\omega_1\mathbf{i} + \bar{I}_y\dot{\omega}_1\mathbf{j} + \bar{I}_z\dot{\omega}_2\mathbf{k} \\ &= -\frac{1}{2}mr^2\omega_2\omega_1\mathbf{i} + \frac{1}{2}mr^2\dot{\omega}_1\mathbf{j} + \frac{1}{4}mr^2\dot{\omega}_2\mathbf{k}\end{aligned}$$

Velocity and acceleration of the mass center *A* of the disk:

$$\mathbf{v}_A = \boldsymbol{\omega}_2\mathbf{k}\times\mathbf{r}_{A/C} = \omega_2\mathbf{k}\times(b\mathbf{i} - c\mathbf{j}) = c\omega_2\mathbf{i} + b\omega_2\mathbf{j}$$

$$\mathbf{a}_A = \dot{\omega}_2\mathbf{k}\times\mathbf{r}_{A/C} + \omega_2\mathbf{k}\times\mathbf{v}_A = (c\dot{\omega}_2 - b\omega_2^2)\mathbf{i} + (b\dot{\omega}_2 + c\omega_2^2)\mathbf{j}$$



$$\Sigma\mathbf{F} = \Sigma\mathbf{F}_{\text{eff}}$$

$$D_x\mathbf{i} + D_y\mathbf{j} + E_x\mathbf{i} + E_y\mathbf{j} = m\mathbf{a}_A$$

PROBLEM 18.105

For the disk of Problem 18.99, determine (*a*) the couple $M_1\mathbf{j}$ which should be applied to arm *ABC* to give it an angular acceleration $\alpha_1 = -(7.5 \text{ rad/s}^2)\mathbf{j}$ when $\omega_1 = 5$ rad/s, knowing that the disk rotates at the constant rate $\omega_2 = 15$ rad/s, (*b*) the force-couple system representing the dynamic reaction at *A* at that instant. Assume that *ABC* has a negligible mass.

PROBLEM 18.99 A thin disk of mass $m = 4$ kg rotates with an angular velocity ω_2 with respect to arm *ABC*, which itself rotates with an angular velocity ω_1 about the *y* axis. Knowing that $\omega_1 = 5$ rad/s and $\omega_2 = 15$ rad/s and that both are constant, determine the force-couple system representing the dynamic reaction at the support at *A*.

SOLUTION

Angular velocity of the disk. $\boldsymbol{\omega} = \omega_1\mathbf{j} + \omega_2\mathbf{k} = (5 \text{ rad/s})\mathbf{j} + (15 \text{ rad/s})\mathbf{k}$

Moments of inertia about principal axes passing through the mass center.

$$\bar{I}_x = \bar{I}_y = \frac{1}{4}mr^2$$

$$= \frac{1}{4}(4)(0.150 \text{ m})^2 = 0.0225 \text{ kg}\cdot\text{m}^2$$

$$\bar{I}_z = \frac{1}{2}mr^2 = 0.045 \text{ kg}\cdot\text{m}^2$$

Angular momentum about mass center C.

$$\mathbf{H}_C = \bar{I}_{x'}\omega_{x'}\mathbf{i} + \bar{I}_{y'}\omega_{y'}\mathbf{j} + I_{z'}\omega_{z'}\mathbf{k}$$

$$= 0 + (0.0225)5\mathbf{j} + (0.045)15\mathbf{k}$$

$$= (0.1125 \text{ kg}\cdot\text{m}^2/\text{s})\mathbf{j} + (0.6750 \text{ kg}\cdot\text{m}^2/\text{s})\mathbf{k}$$

Rate of change of $\mathbf{H}_C$. Let the frame *Axyz* be turning with angular velocity $\boldsymbol{\Omega} = \omega_1\mathbf{j}$.

$$\dot{\mathbf{H}}_C = (\dot{\mathbf{H}}_C)_{Axyz} + \boldsymbol{\Omega}\times\mathbf{H}_C = \bar{I}_x\dot{\omega}_x\mathbf{i} + \bar{I}_y\dot{\omega}_y\mathbf{j} + \bar{I}_z\dot{\omega}_z\mathbf{k} + \boldsymbol{\Omega}\times\mathbf{H}_C$$

$$= 0 + (0.0225)(-7.5)\mathbf{j} + 0 + 5\mathbf{j}\times(0.1125\mathbf{j} + 0.675\mathbf{k})$$

$$= -(0.16875 \text{ N}\cdot\text{m})\mathbf{j} + (3.375 \text{ N}\cdot\text{m})\mathbf{i}$$

Position vector of Point C. $\mathbf{r}_{C/A} = (0.450 \text{ m})\mathbf{i} + (0.225 \text{ m})\mathbf{j}$

Velocity of Point C, the mass center of the disk.

$$\mathbf{v}_C = \omega_1\times\mathbf{r}_{C/A} = 5\mathbf{j}\times(0.45\mathbf{i} + 0.225\mathbf{j}) = -(2.25 \text{ m/s})\mathbf{k}$$

PROBLEM 18.105 (Continued)

Acceleration of Point C.

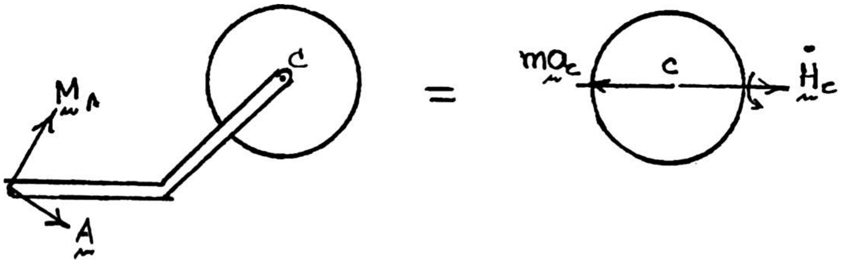
$$\mathbf{a}_C = \alpha_1 \mathbf{j} \times \mathbf{r}_{C/A} + \omega_1 \mathbf{j} \times \mathbf{v}_C = (-7.5\mathbf{j}) \times (0.45\mathbf{i} + 0.225\mathbf{j}) + 5\mathbf{j} \times (-2.25\mathbf{k})$$

$$= (3.3750 \text{ m/s}^2)\mathbf{k} - (11.25 \text{ m/s}^2)\mathbf{i}$$

$$m\mathbf{a}_C = (4)(-11.25\mathbf{i} + 3.3750\mathbf{k})$$

$$= -(45 \text{ N})\mathbf{i} + (13.5 \text{ N})\mathbf{k}$$

Free body and kinetic diagrams



Linear components: $\mathbf{A} = m\mathbf{a}_C \qquad \mathbf{A} = -(45 \text{ N})\mathbf{i} + (13.5 \text{ N})\mathbf{k}$

Moments about A. $\mathbf{M}_A = \mathbf{r}_{C/A} \times m\mathbf{a}_C + \dot{\mathbf{H}}_C$

$$\mathbf{M}_A = (0.450\mathbf{i} + 0.225\mathbf{j}) \times (-45\mathbf{i} + 13.5\mathbf{k}) - 0.16875\mathbf{j} + 3.375\mathbf{i}$$

$$= -6.0750\mathbf{j} + 10.125\mathbf{k} + 3.0375\mathbf{i} - 0.16875\mathbf{j} + 3.375\mathbf{i}$$

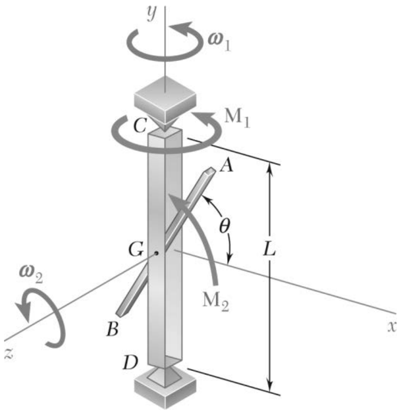
$$= 6.4125\mathbf{i} - 6.2438\mathbf{j} + 10.125\mathbf{k}$$

(*a*) Required couple. $\mathbf{M}_1\mathbf{j} = -(6.24 \text{ N}\cdot\text{m})\mathbf{j}$ ◀

(*b*) Dynamic reaction. $\mathbf{A} = -(45.0 \text{ N})\mathbf{i} + (13.50 \text{ N})\mathbf{k}$ ◀

$\mathbf{M}_A = (6.41 \text{ N}\cdot\text{m})\mathbf{i} + (10.13 \text{ N}\cdot\text{m})\mathbf{k}$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



PROBLEM 18.106*

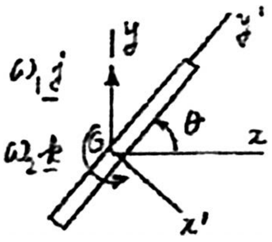
A slender homogeneous rod AB of mass m and length L is made to rotate at the constant rate ω_2 about the horizontal z axis, while frame CD is made to rotate at the constant rate ω_1 about the y axis. Express as a function of the angle θ (*a*) the couple $\mathbf{M}_1$ required to maintain the rotation of the frame, (*b*) the couple $\mathbf{M}_2$ required to maintain the rotation of the rod, (*c*) the dynamic reactions at the supports C and D.

SOLUTION

Angular momentum $\mathbf{H}_G$:

We resolve the angular velocity $\boldsymbol{\omega} = \omega_1\mathbf{j} + \omega_2\mathbf{k}$ into components along the principal axes $Gx'y'z$:

$$\omega_{x'} = -\omega_1 \cos\theta$$
$$\omega_{y'} = \omega_1 \sin\theta$$
$$\omega_z = \omega_2$$



Moments of inertia:

$$\bar{I}_{x'} = \bar{I}_z = \frac{1}{12}mL^2 \quad \bar{I}_{y'} = 0$$

We have

$$H_{x'} = \bar{I}_{x'}\,\omega_{x'} = -\frac{1}{12}mL^2\,\omega_1\cos\theta$$
$$H_{y'} = \bar{I}_{y'}\,\omega_{y'} = 0$$
$$H_z = \bar{I}_z\,\omega_z = \frac{1}{12}mL^2\,\omega_2$$

Computing the components of $\mathbf{H}_G$ along the x, y, z axes:

$$H_x = H_{x'}\sin\theta = -\frac{1}{12}mL^2\,\omega_1\cos\theta\sin\theta = -\frac{1}{24}mL^2\,\omega_1\sin 2\theta$$
$$H_y = -H_{x'}\cos\theta = +\frac{1}{12}mL^2\,\omega_1\cos^2\theta$$
$$H_z = \frac{1}{12}mL^2\,\omega_2$$

The angular momentum is therefore

$$\mathbf{H}_G = -\frac{1}{24}mL^2\omega_1\sin 2\theta\mathbf{i} + \frac{1}{12}mL^2\omega_1\cos^2\theta\mathbf{j} + \frac{1}{12}mL^2\omega_2\mathbf{k}$$

where the reference frame $Gxyz$ rotates with the angular velocity

$$\boldsymbol{\Omega} = \omega_1\mathbf{j}$$

PROBLEM 18.106* (Continued)

<u>Rate of change of $\mathbf{H}_G$</u>. We note that ω_1 and ω_2 are constant, while θ varies with t, with $\dot{\theta} = \omega_2$.

Eq. (18.22) yields

$$\dot{\mathbf{H}}_G = (\dot{\mathbf{H}}_G)_{Gxyz} + \boldsymbol{\Omega}\times\mathbf{H}_G = -\frac{1}{24}mL^2\omega_1(2\cos 2\theta\dot{\theta})\mathbf{i} + \frac{1}{12}mL^2\omega_1(-2\cos\theta\sin\theta\dot{\theta})\mathbf{j}$$

$$+\,\omega_1\mathbf{j}\times\left(-\frac{1}{24}mL^2\omega_1\sin 2\theta\mathbf{i} + \frac{1}{12}mL^2\omega_2\mathbf{k}\right)$$

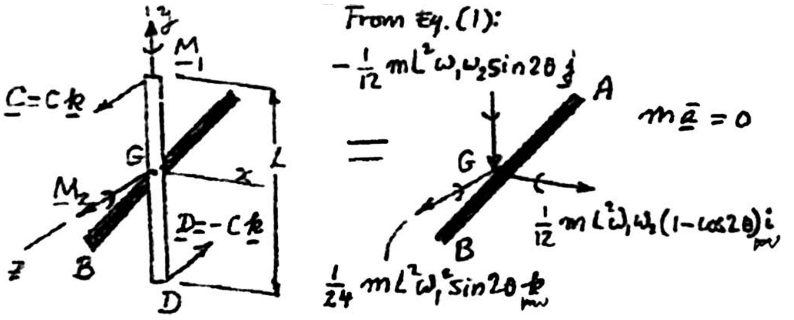
$$= -\frac{1}{12}mL^2\omega_1\omega_2\cos 2\theta\mathbf{i} - \frac{1}{12}mL^2\omega_1\omega_2\sin 2\theta\mathbf{j}$$

$$+\frac{1}{24}mL^2\omega_1^2\sin 2\theta\mathbf{k} + \frac{1}{12}mL^2\omega_1\omega_2\mathbf{i}$$

$$\dot{\mathbf{H}}_G = \frac{1}{12}mL^2\omega_1\omega_2(1-\cos 2\theta)\mathbf{i} - \frac{1}{12}mL^2\omega_1\omega_2\sin 2\theta\mathbf{j}$$

$$+\frac{1}{24}mL^2\omega_1^2\sin 2\theta\mathbf{k} \qquad (1)$$

<u>Equivalence of external and effective forces</u>.



Equating the moments of the variable couples:

$$L\mathbf{j}\times C\mathbf{k} + M_1\mathbf{j} + M_2\mathbf{k} = \dot{\mathbf{H}}_G$$

$$LC\mathbf{i} + M_1\mathbf{j} + M_2\mathbf{k} = \frac{1}{12}mL^2\omega_1\omega_2(1-\cos 2\theta)\mathbf{i} - \frac{1}{12}mL^2\omega_1\omega_2\sin 2\theta\mathbf{j}$$

$$+\frac{1}{24}mL^2\omega_1^2\sin 2\theta\mathbf{k}$$

Equating the coefficients of the unit vectors:

$$\mathbf{j}:\quad M_1 = -\frac{1}{12}mL^2\omega_1\omega_2\sin 2\theta$$

(*a*) Couple M_1: $\mathbf{M}_1 = -\frac{1}{12}mL^2\omega_1\omega_2\sin 2\theta\mathbf{j}$ ◀

$$\mathbf{k}:\quad M_2 = \frac{1}{24}mL^2\omega_1^2\sin 2\theta$$

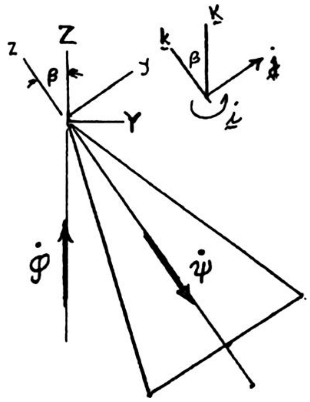
PROBLEM 18.107

A solid cone of height 9 in. with a circular base of radius 3 in. is supported by a ball-and-socket joint at A. Knowing that the cone is observed to precess about the vertical axis AC at the constant rate of 40 rpm in the sense indicated and that its axis of symmetry AB forms an angle $\beta = 40°$ with AC, determine the rate at which the cone spins about the axis AB.

SOLUTION

Use principal axes xyz with origin at A as shown.



For the solid cone,

$$r = 3\text{ in.} = 0.25\text{ ft}$$

$$h = 9\text{ in.} = 0.75\text{ ft} \quad c = \frac{3h}{4} = 0.5625\text{ ft}$$

$$I = \frac{3}{10}mr^2 \quad I' = \frac{3}{5}m\left(h^2 + \frac{1}{4}r^2\right)$$

$$I' - I = \frac{3}{5}m\left(h^2 - \frac{1}{4}r^2\right)$$

<u>Angular velocity</u>.

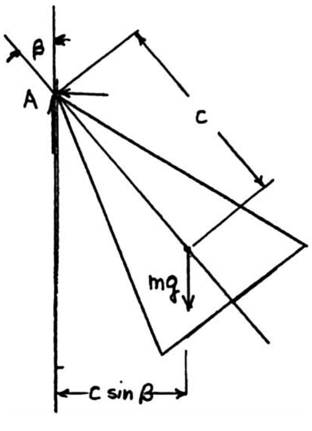
spin: $\dot{\psi}$ about negative z axis

precession: $\dot{\phi}$ about positive Z axis

$$\boldsymbol{\omega} = \dot{\phi}\mathbf{K} - \dot{\psi}\mathbf{k}$$

$$= \dot{\phi}(\cos\beta\mathbf{k} + \sin\beta\mathbf{j}) - \dot{\psi}\mathbf{k}$$

$$\omega_x = 0, \quad \omega_y = \dot{\phi}\sin\beta, \quad \omega_z = \dot{\phi}\cos\beta - \dot{\psi}$$



<u>Angular momentum about fixed Point A</u>.

$$\mathbf{H}_A = I'\omega_x\mathbf{i} + I'\omega_y\mathbf{j} + I\omega_z\mathbf{k}$$

$$= I'\dot{\phi}\sin\beta\mathbf{j} + I(\dot{\phi}\cos\beta - \dot{\psi})\mathbf{k}$$

Let frame $Axyz$ be rotating with angular velocity $\boldsymbol{\Omega}$.

$$\boldsymbol{\Omega} = \dot{\phi}\mathbf{K} = \dot{\phi}\cos\beta\mathbf{j} + \dot{\phi}\sin\beta\,\mathbf{k}$$

<u>Rate of change of $\mathbf{H}_A$</u>.

$$\dot{\mathbf{H}}_A = \boldsymbol{\Omega}\times\mathbf{H}_A = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 0 & \dot{\phi}\sin\beta & \dot{\phi}\cos\beta \\ 0 & I'\dot{\phi}\sin\beta & I(\dot{\phi}\cos\beta - \dot{\psi}) \end{vmatrix}$$

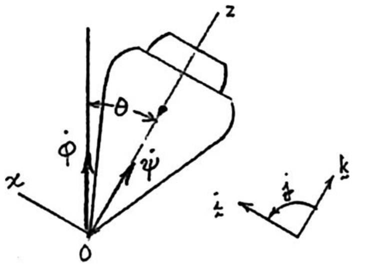
PROBLEM 18.109

The 85-g top shown is supported at the fixed Point O. The radii of gyration of the top with respect to its axis of symmetry and with respect to a transverse axis through O are 21 mm and 45 mm, respectively. Knowing that $c = 37.5$ mm and that the rate of spin of the top about its axis of symmetry is 1800 rpm, determine the two possible rates of steady precession corresponding to $\theta = 30°$.

SOLUTION

Use principal axes x, y, z with origin at O.



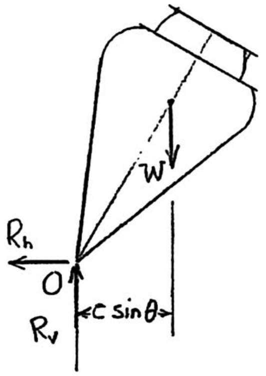
Angular velocity: $\boldsymbol{\omega} = \dot{\varphi}\sin\theta\mathbf{i} + (\dot{\psi} + \dot{\varphi}\cos\theta)\mathbf{k}$

$$\omega_x = \dot{\varphi}\sin\theta, \quad \omega_y = 0, \quad \omega_z = \dot{\psi} + \dot{\varphi}\cos\theta$$

Angular momentum about O:

$$\mathbf{H}_O = I_x\omega_x\mathbf{i} + I_y\omega_y\mathbf{j} + I_z\omega_z\mathbf{k}$$
$$= I'\dot{\varphi}\sin\theta\mathbf{i} + I\omega_z\mathbf{k}$$

Let the reference frame $Oxyz$ be rotating with angular velocity $\boldsymbol{\Omega} = \dot{\varphi}\sin\theta\mathbf{i} + \dot{\varphi}\cos\theta\mathbf{k}$.



$$\dot{\mathbf{H}}_O = \boldsymbol{\Omega} \times \mathbf{H}_O$$
$$= (\dot{\varphi}\sin\theta\mathbf{i} + \dot{\varphi}\cos\theta\mathbf{k}) \times (I'\dot{\varphi}\sin\theta + I\omega_z\mathbf{k})$$
$$= (I'\dot{\varphi}\sin\theta\cos\theta - I\omega_z\sin\theta)\dot{\varphi}\mathbf{j}$$

$$\Sigma\mathbf{M}_O = \dot{\mathbf{H}}_O$$

$$-Wc\sin\theta\mathbf{j} = (I'\dot{\varphi}\sin\theta\cos\theta - I\omega_z\sin\theta)\mathbf{j}$$

$$Wc = (I\omega_z - I'\dot{\varphi}\cos\theta)\dot{\varphi}$$

$$Wc = [I\dot{\psi} - (I' - I)\dot{\varphi}\cos\theta]\dot{\varphi} \qquad (1)$$

<u>Data</u>:

$$m = 85 \text{ g} = 0.085 \text{ kg}$$
$$W = mg = (0.085)(9.81) = 0.83385 \text{ N}$$

$$I = mk_z^2 = (0.085)(0.021)^2 = 37.485 \times 10^{-6} \text{ kg}\cdot\text{m}^2$$
$$I' = mk_x^2 = (0.085)(0.045)^2 = 172.125 \times 10^{-6} \text{ kg}\cdot\text{m}^2$$

$$c = 37.5 \text{ mm} = 0.0375 \text{ m}, \quad \dot{\psi} = 1800 \text{ rpm} = 188.496 \text{ rad/s}$$

$$\theta = 30°$$

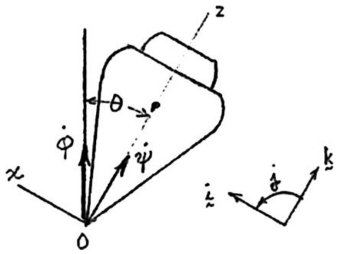
PROBLEM 18.110

The top shown is supported at the fixed Point O and its moments of inertia about its axis of symmetry and about a transverse axis through O are denoted, respectively, by I and I'. (a) Show that the condition for steady precession of the top is

$$(I\omega_z - I'\dot{\phi}\cos\theta)\dot{\phi} = Wc$$

where $\dot{\phi}$ is the rate of precession and ω_z is the rectangular component of the angular velocity along the axis of symmetry of the top. (b) Show that if the rate of spin $\dot{\psi}$ of the top is very large compared with its rate of precession $\dot{\phi}$, the condition for steady precession is $I\dot{\psi}\dot{\phi} \approx Wc$. ($c$) Determine the percentage error introduced when this last relation is used to approximate the slower of the two rates of precession obtained for the top of Problem 18.109.

SOLUTION



Use principal axes x, y, z with origin at O.

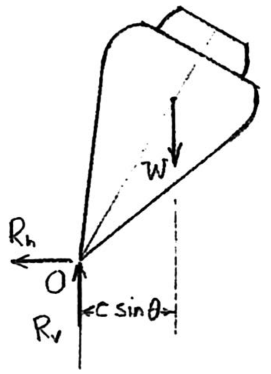
Angular velocity: $\boldsymbol{\omega} = \dot{\varphi}\sin\theta\mathbf{i} + (\dot{\psi} + \dot{\varphi}\cos\theta)\mathbf{k}$

$$\omega_x = \dot{\varphi}\sin\theta, \quad \omega_y = 0, \quad \omega_z = \dot{\psi} + \dot{\varphi}\cos\theta$$

Angular momentum about O:

$$\mathbf{H}_O = I_x\omega_x\mathbf{i} + I_y\omega_y\mathbf{j} + I_z\omega_z\mathbf{k} = I'\dot{\varphi}\sin\theta\mathbf{i} + I\omega_z\mathbf{k}$$

Let the reference frame $Oxyz$ be rotating with angular velocity $\boldsymbol{\Omega} = \dot{\varphi}\sin\theta\mathbf{i} + \dot{\varphi}\cos\theta\mathbf{k}$.



$$\begin{aligned}\dot{\mathbf{H}}_O &= \boldsymbol{\Omega}\times\mathbf{H}_O \\ &= (\dot{\varphi}\sin\theta\mathbf{i} + \dot{\varphi}\cos\theta\mathbf{k})\times(I'\dot{\varphi}\sin\theta + I\omega_z\mathbf{k}) \\ &= (I'\dot{\varphi}\sin\theta\cos\theta - I\omega_z\sin\theta)\dot{\varphi}\mathbf{j}\end{aligned}$$

$$\Sigma\mathbf{M}_O = \dot{\mathbf{H}}_O$$

$$-Wc\sin\theta\mathbf{j} = (I'\dot{\varphi}\sin\theta\cos\theta - I\omega_z\sin\theta)\mathbf{j}$$

(a) $$Wc = (I\omega_z - I'\dot{\varphi}\cos\theta)\dot{\varphi} \blacktriangleleft$$

$$Wc = [I\dot{\psi} - (I' - I)\dot{\varphi}\cos\theta]\dot{\varphi} \qquad (1)$$

(b) For $|\dot{\varphi}| << \dot{\psi}$, $$Wc \approx I\dot{\psi}\dot{\varphi} \qquad (2) \blacktriangleleft$$

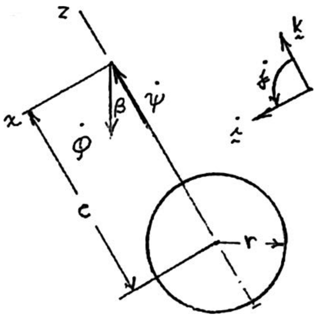
PROBLEM 18.112

A solid aluminum sphere of radius 4 in. is welded to the end of a 10-in.-long rod AB of negligible mass which is supported by a ball-and-socket joint at A. Knowing that the sphere spins as shown about line AB at the rate of 600 rpm, determine the angle β for which the sphere will precess about a vertical axis at the constant rate of 60 rpm in the sense indicated.

SOLUTION



Use principal axes x, y, z with origin at A.

Angular velocity:

$$\boldsymbol{\omega} = \dot{\varphi}\sin\beta\,\mathbf{i} + (\dot{\psi} - \dot{\varphi}\cos\beta)\mathbf{k}$$

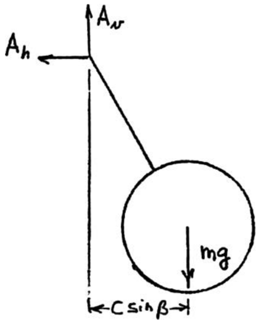
$$\omega_x = \dot{\varphi}\sin\beta, \quad \omega_y = 0, \quad \omega_z = \dot{\psi} - \dot{\varphi}\cos\beta$$

Angular momentum about A:

$$\mathbf{H}_A = I_x\omega_x\mathbf{i} + I_y\omega_y\mathbf{j} + I_z\omega_z\mathbf{k}$$

$$= I'\dot{\varphi}\sin\beta\,\mathbf{i} + I(\dot{\psi} - \dot{\varphi}\cos\beta)\mathbf{k}$$

Let the reference frame $Axyz$ be rotating with angular velocity $\boldsymbol{\Omega} = \dot{\varphi}\sin\beta\,\mathbf{i} - \dot{\varphi}\cos\beta\,\mathbf{k}$.



$$\dot{\mathbf{H}}_A = \boldsymbol{\Omega} \times \mathbf{H}_A$$

$$= -\dot{\varphi}[I\dot{\psi}\sin\beta + (I' - I)\dot{\varphi}\sin\beta\cos\beta]\mathbf{j}$$

$$\Sigma\mathbf{M}_A = \dot{\mathbf{H}}_A$$

$$-mgc\sin\beta\,\mathbf{j} = -\dot{\varphi}[I\dot{\psi}\sin\beta + (I' - I)\dot{\varphi}\sin\beta\cos\beta]\mathbf{j}$$

$$mgc = I\dot{\varphi}\dot{\psi} - (I' - I)\dot{\varphi}^2\cos\beta$$

$$\frac{I\dot{\varphi}\dot{\psi}}{mgc} - \frac{(I' - I)\dot{\varphi}^2\cos\beta}{mgc} + 1 = 0 \qquad (1)$$

<u>Data</u>:

$$r = 4\text{ in.} = \frac{1}{3}\text{ ft}$$

$$c = 10 + 4 = 14\text{ in.}$$

$$= \frac{14}{12} = \frac{7}{6}\text{ ft},$$

$$g = 32.2\text{ ft/s}^2$$

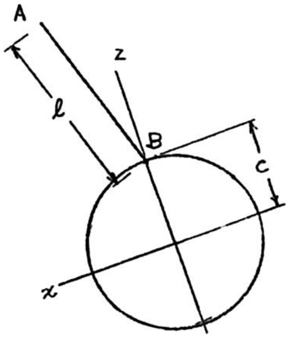
PROBLEM 18.113

A solid sphere of radius $c = 3$ in. is attached as shown to cord AB. The sphere is observed to precess at the constant rate $\dot{\phi} = 6$ rad/s about the vertical axis AD. Knowing that $\beta = 40°$, determine the angle θ that the diameter BC forms with the vertical when the sphere (*a*) has no spin, (*b*) spins about its diameter BC at the rate $\dot{\psi} = 50$ rad/s, (*c*) spins about BC at the rate $\dot{\psi} = -50$ rad/s.

SOLUTION



Use principal centroidal axes x, y, z as shown.

Angular velocity: $\quad \boldsymbol{\omega} = -\dot{\varphi}\sin\theta\mathbf{i} + (\dot{\psi} + \dot{\varphi}\cos\theta)\mathbf{k}$

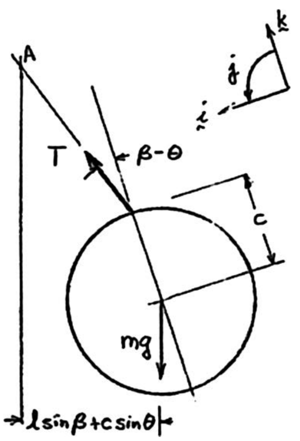
Angular momentum about the mass center G:

$$\mathbf{H}_G = I_x\omega_x\mathbf{i} + I_y\omega_y\mathbf{j} + I_z\omega_z\mathbf{k}$$
$$= -I'\dot{\varphi}\sin\theta\mathbf{i} + I(\dot{\psi} + \dot{\varphi}\cos\theta)\mathbf{k}$$

Let the reference frame $Gxyz$ be rotating with angular velocity

$$\boldsymbol{\Omega} = -\dot{\varphi}\sin\theta\mathbf{i} + \dot{\varphi}\cos\theta\mathbf{k}$$
$$\dot{\mathbf{H}}_G = \boldsymbol{\Omega} \times \mathbf{H}_G$$
$$= [I\dot{\varphi}\dot{\psi}\sin\theta - (I' - I)\dot{\varphi}^2\sin\theta\cos\theta]\mathbf{j}$$

Acceleration of the mass center:



$$\bar{\mathbf{a}} = (l\sin\beta + c\sin\theta)\dot{\varphi}^2 \longleftarrow$$

$$\Sigma\mathbf{F} = \Sigma\mathbf{F}_{\text{eff}}:$$

$+\uparrow$: $\quad T\cos\beta - mg = 0, \qquad T = \dfrac{mg}{\cos\beta} \qquad (1)$

$+\longleftarrow$: $\quad T\sin\beta = m\bar{a}$

$$g\tan\beta = (l\sin\beta + c\sin\theta)\dot{\varphi}^2 \qquad (2)$$

$$+\circlearrowleft \Sigma M_G = Tc\sin(\beta - \theta) = \dot{H}_G$$

$$\frac{mgc\sin(\beta - \theta)}{\cos\beta} = I\dot{\psi}\dot{\varphi}\sin\theta - (I' - I)\dot{\varphi}^2\sin\theta\cos\theta \qquad (3)$$

<u>Data</u>: $\quad c = 3 \text{ in.} = 0.25 \text{ ft}, \quad \beta = 40°, \quad \dot{\varphi} = 6 \text{ rad/s}$

$$\frac{I}{m} = \frac{I'}{m} = \frac{2}{5}c^2 = 0.025 \text{ ft}^2 \quad I' - I = 0$$

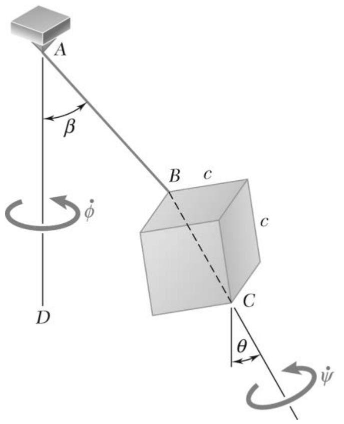
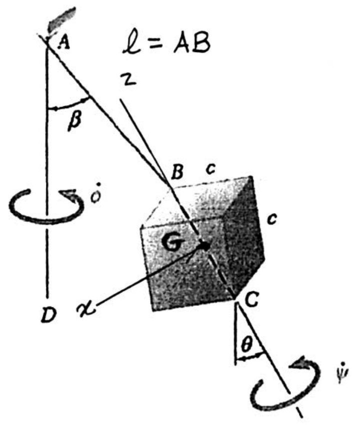
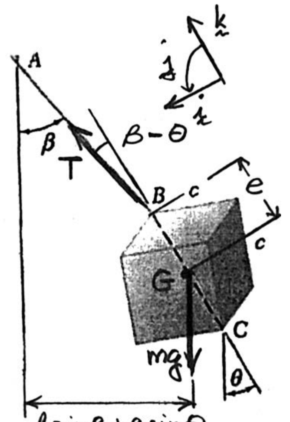
PROBLEM 18.115



A solid cube of side $c = 80$ mm is attached as shown to cord *AB*. It is observed to spin at the rate $\dot{\psi} = 40$ rad/s about its diagonal *BC* and to precess at the constant rate $\dot{\phi} = 5$ rad/s about the vertical axis *AD*. Knowing that $\beta = 30°$, determine the angle ϕ that the diagonal *BC* forms with the vertical. (*Hint:* The moment of inertia of a cube about an axis through its center is independent of the orientation of that axis.)

SOLUTION





Use centroidal axes *x*, *y*, *z* such that the *z* axis lies along the body diagonal *BC* and the *x* axis lies in the plane of *A*, *B*, *C*, and *D*. Let *e* be the length *GB*.

$$e = \frac{\sqrt{3}}{2}c$$

Moment of inertia: $$I_x = I_y = I_z = \frac{1}{6}mc^2$$

Angular velocity: $$\boldsymbol{\omega} = -\dot{\phi}\sin\theta\mathbf{i} + (\dot{\psi} + \dot{\varphi}\cos\theta)\mathbf{k}$$

Angular momentum about the mass center *G*:

$$\mathbf{H}_G = I_x\omega_x\mathbf{i} + I_y\omega_y\mathbf{j} + I_z\omega_z\mathbf{k} = -I'\dot{\varphi}\sin\theta\mathbf{i} + I(\dot{\psi} + \dot{\varphi}\cos\theta)\mathbf{k}$$

Let the reference frame *Gxyz* be rotating with angular velocity

$$\boldsymbol{\Omega} = -\dot{\varphi}\sin\theta\mathbf{i} + \dot{\varphi}\cos\theta\mathbf{k}$$

$$\dot{\mathbf{H}}_G = \boldsymbol{\Omega} \times \mathbf{H}_G$$

$$= [I\dot{\varphi}\dot{\psi}\sin\theta - (I' - I)\dot{\varphi}^2\sin\theta\cos\theta]\mathbf{j}$$

Acceleration of the mass center:

$$\bar{\mathbf{a}} = (l\sin\beta + e\sin\theta)\dot{\varphi}^2 \longleftarrow$$

$$\Sigma\mathbf{F} = \Sigma\mathbf{F}_{\text{eff}}:$$

$$+\!\uparrow: \quad T\cos\beta - mg = 0, \quad T = \frac{mg}{\cos\beta} \tag{1}$$

$$+\!\longleftarrow: \quad T\sin\beta = m\bar{a}$$

$$g\tan\beta = (l\sin\beta + e\sin\theta)\dot{\varphi}^2 \tag{2}$$

$$+\circlearrowleft \Sigma M_G = Te\sin(\beta - \theta) = \dot{H}_G$$

$$\frac{mge\sin(\beta - \theta)}{\cos\beta} = I\dot{\psi}\dot{\varphi}\sin\theta - (I' - I)\dot{\varphi}^2\sin\theta\cos\theta \tag{3}$$

PROBLEM 18.116 (Continued)

Data:

$$c = 120 \text{ mm} = 0.12 \text{ m}$$

$$e = \frac{\sqrt{3}}{2}(0.12) = 0.103923 \text{ m}$$

$$l = 240 \text{ mm} = 0.24 \text{ m}$$

$$\frac{I}{m} = \frac{I'}{m} = \frac{1}{6}c^2 = \frac{1}{6}(0.12)^2 = 2.4\times 10^3 \text{ m}^2 \quad I' - I = 0$$

$$\theta = 25° \quad \beta = 40° \quad \theta - \beta = 15°$$

From Eq. (2),

$$(9.81)\tan 40° = (0.24\sin 40° + 0.103923\sin 25°)\dot{\varphi}^2$$

$$\dot{\varphi}^2 = 41.534 \qquad \dot{\varphi} = 6.4447 \text{ rad/s}$$

From Eq. (3),

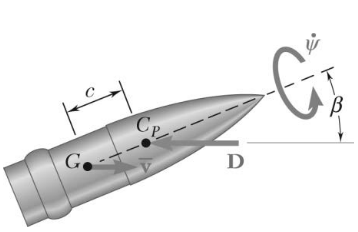
$$\frac{(9.81)(0.103923)\sin 15°}{\cos 40°} = (2.4\times 10^{-3})\dot{\psi}(6.4447)\sin 25°$$

(*a*) $\dot{\psi} = 52.694$ rad/s $\qquad \dot{\psi} = 52.7$ rad/s ◀

(*b*) $\qquad \dot{\varphi} = 6.44$ rad/s ◀

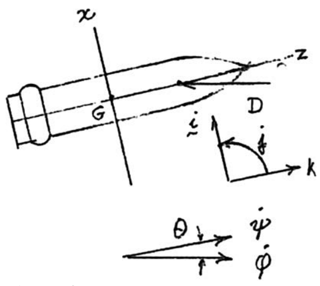
PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 18.117



A high-speed photographic record shows that a certain projectile was fired with a horizontal velocity $\bar{\mathbf{v}}$ of 2000 ft/s and with its axis of symmetry forming an angle $\beta = 3°$ with the horizontal. The rate of spin $\dot{\psi}$ of the projectile was 6000 rpm, and the atmospheric drag was equivalent to a force **D** of 25 lb acting at the center of pressure C_P located at a distance $c = 6$ in. from G. (*a*) Knowing that the projectile has a weight of 45 lb and a radius of gyration of 2 in. with respect to its axis of symmetry, determine its approximate rate of steady precession. (*b*) If it is further known that the radius of gyration of the projectile with respect to a transverse axis through G is 8 in., determine the exact values of the two possible rates of precession.

SOLUTION



Choose principal centroidal axes x, y, z as shown.

The symmetry (spin) axis is the z axis.

Reduce the drag force to a force-couple system at the mass center.

$$\mathbf{F} = (D\sin\beta - W\cos\beta)\mathbf{i} - (D\cos\beta - W\sin\beta)\mathbf{k}$$

$$\mathbf{M}_G = Dc\sin\beta\,\mathbf{j}$$

For the occurrence of steady precession, the precession axis must be parallel to the drag force.

Thus, $\theta = \beta = 3°$.

(*a*) Using Equation (18.44), $\Sigma M_G = \dot{\mathbf{H}}_G$

$$Dc\sin\beta = (I\omega_z - I'\dot{\varphi}\cos\theta)\dot{\varphi}\sin\theta$$

Using $\beta = \theta$ and $\omega_z = \dot{\psi} + \dot{\varphi}\cos\theta$ gives

$$I\dot{\psi}\dot{\varphi} - (I' - I)\dot{\varphi}^2\cos\theta = Dc \qquad (1)$$

Neglecting the quadratic term in $\dot{\varphi}$,

$$I\dot{\psi}\dot{\varphi} \approx Dc \qquad \dot{\varphi} \approx \frac{Dc}{I\dot{\psi}}$$

<u>Data</u>:

$$W = 45 \text{ lb}, \quad m = \frac{W}{g} = \frac{45}{32.2} = 1.3975 \text{ slug}$$

$$I = mk_z^2 = (1.3975)\left(\frac{2}{12}\right)^2 = 0.0388205 \text{ slug}\cdot\text{ft}^2$$

$$\dot{\psi} = 6000 \text{ rpm} = 628.32 \text{ rad/s}, \quad c = \frac{6}{12} \text{ in.} = 0.5 \text{ ft}$$

$$\dot{\varphi} \approx \frac{(25)(0.5)}{(0.0388205)(628.32)} = 0.51248 \text{ rad/s}$$

$\dot{\varphi} \approx 4.89$ rpm ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

(*b*) $$I' = mk_x^2 = (1.3975)\left(\frac{8}{12}\right)^2 = 0.62112 \text{ slug}\cdot\text{ft}^2$$

$$I' - I = 0.58230 \text{ slug}\cdot\text{ft}^2$$

Substituting into Equation (1),

$$(0.0388205)(628.32)\dot{\varphi} - (0.58230)\dot{\varphi}^2 \cos 3° = (25)(0.5)$$

$$0.58150\dot{\varphi}^2 - 24.3912\dot{\varphi} + 12.5 = 0$$

$$\dot{\varphi} = 20.9727 \pm 20.4538$$

$$= 0.51890 \text{ rad/s}, \quad 41.427 \text{ rad/s} \qquad \dot{\varphi} = 4.96 \text{ rpm}, 396 \text{ rpm} \blacktriangleleft$$

PROBLEM 18.118

If the earth were a sphere, the gravitational attraction of the sun, moon, and planets would at all times be equivalent to a single force **R** acting at the mass center of the earth. However, the earth is actually an oblate spheroid and the gravitational system acting on the earth is equivalent to a force **R** and a couple **M**. Knowing that the effect of the couple **M** is to cause the axis of the earth to precess about the axis *GA* at the rate of one revolution in 25,800 years, determine the average magnitude of the couple **M** applied to the earth. Assume that the average density of the earth is $5.51\ \text{g/cm}^3$, that the average radius of the earth is 6370 km, and that $\bar{I} = \frac{2}{5}mR^2$. (*Note:* This forced precession is known as the precession of the equinoxes and is not to be confused with the free precession discussed in Problem 18.123.)

SOLUTION

$$25{,}800 \text{ years} = (25{,}800 \text{ yr})(365.24 \text{ day/yr})(24 \text{ h/day})(3600 \text{ s/h})$$
$$= 814.16\times10^9 \text{ s}$$
$$\dot{\varphi} = \frac{2\pi}{814.16\times10^9} = 7.7173\times10^{-12} \text{ rad/s}$$
$$\dot{\psi} = \frac{2\pi}{(23.93 \text{ h})(3600 \text{ s/h})} = 72.935\times10^{-6} \text{ rad/s}$$

Mass density of Earth: $\rho = 5.51 \text{ g/cm}^3 = 5510 \text{ kg/m}^3$

Radius of Earth: $R = 6370 \text{ km} = 6.370\times10^6 \text{ m}$

Mass of Earth: $\frac{4}{3}\pi R^3\rho = \frac{4}{3}\pi(6.370\times10^6)^3(5510) = 5.9657\times10^{24} \text{ kg}$

$$\bar{I} = \frac{2}{5}mR^2 = \frac{2}{5}(5.9657\times10^{24})(6.370\times10^6)^2$$
$$= 96.827\times10^{36} \text{ kg}\cdot\text{m}^2$$

Using Equation (18.44),

$$M = (I\omega_z - I'\dot{\varphi}\cos\theta)\dot{\varphi}\sin\theta$$
$$= [I\dot{\psi} + (I - I')\dot{\varphi}\cos\theta]\dot{\varphi}\sin\theta$$
$$= I\dot{\psi}\dot{\varphi}\sin\theta$$
$$= (96.827\times10^{36})(72.935\times10^{-6})(7.7173\times10^{-12})\sin 23.45°$$
$$= 21.688\times10^{21} \text{ N}\cdot\text{m}$$

$M = 21.7\times10^{21} \text{ N}\cdot\text{m}$ ◀

PROBLEM 18.119

Show that for an axisymmetrical body under no force, the rates of precession and spin can be expressed, respectively, as

$$\dot{\varphi} = \frac{H_G}{I'}$$

and

$$\dot{\psi} = \frac{H_G \cos\theta (I' - I)}{II'}$$

where H_G is the constant value of the angular momentum of the body.

SOLUTION

By Equations (18.48), $\omega_x = -\frac{H_G \sin\theta}{I'}, \quad \omega_y = 0, \quad \omega_z = \frac{H_G \cos\theta}{I}$

By Equation (18.35) with $\dot{\theta} = 0,$

$$\omega_x = -\dot{\varphi}\sin\theta, \quad \omega_y = 0, \quad \omega_z = \dot{\psi} + \dot{\varphi}\cos\theta$$

Eliminating ω_x and ω_z,

$$\dot{\varphi} = \frac{H_G}{I'}$$

$$\dot{\psi} + \dot{\varphi}\cos\theta = \frac{H_G \cos\theta}{I}$$

$$\dot{\psi} = \frac{H_G \cos\theta}{I} - \dot{\varphi}\cos\theta = \frac{H_G \cos\theta}{I} - \frac{H_G \cos\theta}{I'} = \frac{H_G (I' - I)\cos\theta}{II'}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 18.120

(*a*) Show that for an axisymmetrical body under no force, the rate of precession can be expressed as

$$\dot{\phi} = \frac{I\omega_z}{I'\cos\theta}$$

where ω_z is the rectangular component of $\boldsymbol{\omega}$ along the axis of symmetry of the body. (*b*) Use this result to check that the condition (18.44) for steady precession is satisfied by an axisymmetrical body under no force.

SOLUTION

(*a*) Angular velocity of the body: $\boldsymbol{\omega} = -\dot{\varphi}\sin\theta\mathbf{i} + \omega_2\mathbf{k}$

Its angular momentum about *G*: $\mathbf{H}_G = -I'\dot{\varphi}\sin\theta\mathbf{i} + I\omega_2\mathbf{k}$

Let the reference frame $Gxyz$ be rotating with angular velocity $\mathbf{\Omega}$, where

$$\mathbf{\Omega} = -\dot{\varphi}\sin\theta\mathbf{i} + \dot{\varphi}\cos\theta\mathbf{k}$$

$$\begin{aligned}\dot{\mathbf{H}}_G &= (\dot{\mathbf{H}}_G)_{Gxyz} + \mathbf{\Omega}\times\mathbf{H}_G \\ &= 0 + (-\dot{\varphi}\sin\theta\mathbf{i} + \dot{\varphi}\cos\theta\mathbf{k})\times(-I'\dot{\varphi}\sin\theta\mathbf{i} + I\omega_z\mathbf{k}) \\ &= I\dot{\varphi}\omega_z\sin\theta - I'\dot{\varphi}^2\sin\theta\cos\theta\end{aligned}$$

For no force, $\dot{\mathbf{H}}_G = 0$

Hence, $(I\omega_z - I'\dot{\varphi}\cos\theta)\dot{\varphi}\sin\theta = 0$ or $I\omega_z - I'\dot{\varphi}\cos\theta = 0$ (1)

Solving for $\dot{\varphi}$, $\dot{\varphi} = \dfrac{I\omega_z}{I'\cos\theta}$

(*b*) Comparing Equation (1) with Equation (18.44) yields $\Sigma\mathbf{M}_0 = 0$, which is the condition for no force.

PROBLEM 18.121

Show that the angular velocity vector $\boldsymbol{\omega}$ of an axisymmetrical body under no force is observed from the body itself to rotate about the axis of symmetry at the constant rate

$$n = \frac{I' - I}{I'}\omega_z$$

where ω_z is the rectangular component of $\boldsymbol{\omega}$ along the axis of symmetry of the body.

SOLUTION

Angular velocity of the body: $\boldsymbol{\omega} = -\dot{\varphi}\sin\theta\mathbf{i} + (\dot{\varphi}\cos\theta + \dot{\psi})\mathbf{k}$

Let the reference frame $Gxyz$ be rotating with angular velocity $\boldsymbol{\Omega}$, where

$$\boldsymbol{\Omega} = -\dot{\varphi}\sin\theta\mathbf{i} + \dot{\varphi}\cos\theta\mathbf{j}$$

Angular acceleration of the body: $\boldsymbol{\alpha} = \dot{\boldsymbol{\omega}}_{Gxyz} + \boldsymbol{\Omega}\times\boldsymbol{\omega}$

$$\boldsymbol{\alpha} = 0 + \dot{\varphi}\dot{\psi}\sin\theta\mathbf{j}$$

The rate of change of angular velocity as observed from the body is $-\boldsymbol{\alpha}$.

Assume that $-\boldsymbol{\alpha}$ may be represented as the angular velocity vector rotating with angular velocity $l\mathbf{i} + m\mathbf{j} + n\mathbf{k}$.

$$\begin{aligned}-\boldsymbol{\alpha} &= (l\mathbf{i} + m\mathbf{j} + n\mathbf{k})\times(\omega_x\mathbf{i} + \omega_z\mathbf{k}) \\ &= m\omega_z\mathbf{i} + (n\omega_x - l\omega_z)\mathbf{j} - m\omega_x\mathbf{k}\end{aligned}$$

Matching components:

$\mathbf{i}$: $0 = m\omega_z \quad m = 0$

$\mathbf{j}$: $-\dot{\varphi}\dot{\psi}\sin\theta = n\omega_x - l\omega_z$ (1)

$\mathbf{k}$: $0 = -m\omega_x \quad m = 0$

From Equation (1), $-\dot{\varphi}\dot{\psi}\sin\theta = -n\dot{\varphi}\sin\theta - l(\dot{\varphi}\cos\theta + \dot{\psi})$

from which $l = 0$ and $n = \dot{\psi}$.

Using Equation (18.44) with $\Sigma\mathbf{M}_0 = 0$ yields $I\omega_z - I'\dot{\varphi}\cos\theta = 0$

or $\dot{\varphi}\cos\theta = \dfrac{I\omega_z}{I'}$

But $\omega_z = \dot{\psi} + \dot{\varphi}\cos\theta = \dot{\psi} + \dfrac{I\omega_z}{I'}$

Solving for $\dot{\psi}$, $\dot{\psi} = \dfrac{I' - I}{I}\omega_z$

Using $\omega_z = \omega_2$ and $n = \dot{\psi}$ yields $n = \dfrac{I' - I}{I'}\omega_z$. ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 18.122

For an axisymmetrical body under no force, prove (*a*) that the rate of retrograde precession can never be less than twice the rate of spin of the body about its axis of symmetry, (*b*) that in Figure 18.24 the axis of symmetry of the body can never lie within the space cone.

SOLUTION

For no force, $\mathbf{M}_G = 0$

(*a*) Using Equation (18.44), $0 = (\bar{I}\omega_z - \bar{I}'\dot{\varphi}\cos\theta)\dot{\varphi}\sin\theta$

$$\bar{I}\omega_z - \bar{I}'\dot{\varphi}\cos\theta = 0$$

Using $\omega_z = \dot{\psi} + \dot{\varphi}\cos\theta$ yields $\bar{I}\dot{\psi} - (\bar{I}' - I)\dot{\varphi}\cos\theta = 0$

$$\dot{\varphi} = \frac{\bar{I}\dot{\psi}}{(\bar{I}' - \bar{I})\cos\theta}$$

$$|\dot{\varphi}| = \frac{\bar{I}\dot{\psi}}{(\bar{I} - \bar{I}')}\sec\theta$$

For a flat disk, $\bar{I}' = \frac{1}{2}\bar{I}$

For any other shape, $\bar{I}' > \frac{1}{2}\bar{I}$

Hence, $\bar{I} - \bar{I}' < \frac{1}{2}I$ and $\dfrac{\bar{I}}{\bar{I} - \bar{I}'} > 2$

Also, $\sec\theta > 1$: $|\dot{\varphi}| > 2\dot{\psi}$

(*b*) $\tan\gamma = \dfrac{I}{I'}\tan\theta$ or $\tan\theta = \dfrac{I'}{I}\tan\gamma > \dfrac{1}{2}\tan\gamma$

Angle of surface of space cone is $\gamma - \theta$.

Angle of axis is θ.

$$\tan\theta > \frac{1}{2}\tan[\theta + (\gamma - \theta)] = \frac{1}{2}\frac{\tan\theta + \tan(\gamma - \theta)}{1 + \tan\theta\tan(\gamma - \theta)}$$

$$[1 + \tan\theta\tan(\gamma - \theta)]\tan\theta > \frac{1}{2}\tan\theta + \frac{1}{2}\tan(\gamma - \theta)$$

If you are a student using this Manual, you are using it without permission.*

PROBLEM 18.122 (Continued)

$$\tan\theta + \tan^2\theta\tan(\gamma-\theta) > \frac{1}{2}\tan\theta + \frac{1}{2}\tan(\gamma-\theta)$$

$$\frac{1}{2}\tan\theta > \frac{1}{2}\tan(\gamma-\theta) - \tan^2\theta\tan(\gamma-\theta)$$

$$\frac{1}{2}\tan\theta > \frac{1}{2}\tan(\gamma-\theta)$$

$$\tan\theta > \tan(\gamma-\theta)$$

$$\theta > (\gamma-\theta)$$

The axis lies outside the space cone. ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 18.123

Using the relation given in Problem 18.121, determine the period of precession of the north pole of the earth about the axis of symmetry of the earth. The earth may be approximated by an oblate spheroid of axial moment of inertia I and of transverse moment of inertia $I' = 0.9967I$. (*Note:* Actual observations show a period of precession of the north pole of about 432.5 mean solar days; the difference between the observed and computed periods is due to the fact that the earth is not a perfectly rigid body. The free precession considered here should not be confused with the much slower precession of the equinoxes, which is a forced precession. See Problem 18.118.)

SOLUTION

Angular velocity of the body: $\boldsymbol{\omega} = -\dot{\varphi}\sin\theta\mathbf{i} + (\dot{\varphi}\cos\theta + \dot{\psi})\mathbf{k}$

Let the reference frame $Gxyz$ be rotating with angular velocity $\boldsymbol{\Omega}$, where

$$\boldsymbol{\Omega} = -\dot{\varphi}\sin\theta\mathbf{i} + \dot{\varphi}\cos\theta\mathbf{j}$$

Angular acceleration of the body: $\boldsymbol{\alpha} = \dot{\omega}_{Gxyz} + \boldsymbol{\Omega}\times\boldsymbol{\omega}$

The rate of change of angular velocity as observed from the body is $-\boldsymbol{\alpha}$.

Assume that $-\alpha$ may be represented as the angular velocity vector rotating with angular velocity

$$l\mathbf{i} + m\mathbf{j} + n\mathbf{k}.$$

$$-\boldsymbol{\alpha} = (l\mathbf{i} + m\mathbf{j} + n\mathbf{k})\times(\omega_x\mathbf{i} + \omega_z\mathbf{k})$$
$$= -m\omega_z\mathbf{i} + (n\omega_x - l\omega_z\mathbf{j}) - m\omega_x\mathbf{k}$$

Matching components: $\mathbf{i}$: $0 = m\omega_z \qquad m = 0$

$$\mathbf{j}: \quad -\dot{\varphi}\dot{\psi}\sin\theta = n\omega_x - l\omega_z \qquad (1)$$

$$\mathbf{k}: \quad 0 = -m\omega_x \qquad m = 0$$

From Equation (1), $-\dot{\varphi}\dot{\psi}\sin\theta = -n\dot{\varphi}\sin\theta - l(\dot{\varphi}\cos\theta + \dot{\psi})$

From which $l = 0$ and $n = \dot{\psi}$.

Using Equation (18.44) with $\Sigma\mathbf{M}_0 = 0$ yields $I\omega_z - I'\dot{\varphi}\cos\theta = 0$

or
$$\dot{\varphi}\cos\theta = \frac{I\omega_z}{I'}$$

But
$$\omega_z = \dot{\psi} + \dot{\varphi}\cos\theta = \dot{\psi} + \frac{I\omega_z}{I'}$$

Solving for $\dot{\psi}$,
$$\dot{\psi} = \frac{I' - I}{I}\omega_z$$

PROBLEM 18.124

A coin is tossed into the air. It is observed to spin at the rate of 600 rpm about an axis *GC* perpendicular to the coin and to precess about the vertical direction *GD*. Knowing that *GC* forms an angle of 15° with *GD*, determine (*a*) the angle that the angular velocity **ω** of the coin forms with *GD*, (*b*) the rate of precession of the coin about *GD*.

SOLUTION

Moments of inertia: $I = \frac{1}{2}mr^2$

$$I' = \frac{1}{4}mr^2$$

Euler angle θ for steady precession: $\theta = 15°$

For axisymmetric body under no force, Equation (18.49) gives for the body cone angle:

$$\tan\gamma = \frac{I}{I'}\tan\theta = 2\tan 15° \qquad \gamma = 28.187°$$

(*a*) Angular velocity: $\boldsymbol{\omega} = \omega(-i\sin\gamma + \mathbf{k}\cos\gamma)$

Its projection onto the vertical direction is

$$\omega\cos\beta = \boldsymbol{\omega}\cdot\mathbf{k} = \omega(-i\sin\gamma + \mathbf{k}\cos\gamma)\cdot(-\sin\theta\mathbf{i} + \cos\theta\mathbf{k})$$
$$= \omega(\sin\gamma\sin\theta + \cos\gamma\cos\theta) = \omega\cos(\gamma - \theta)$$

$$\cos\beta = \cos(\gamma - \theta) \qquad \beta = |\gamma - \theta| = 28.187° - 15° = 13.187°$$

Angle between **ω** and vertical direction *GD*: $\beta = 13.19°$ ◀

(*b*)
$$\tan\gamma = -\frac{\omega_x}{\omega_z} = \frac{\dot\varphi\sin\theta}{\dot\varphi\cos\theta + \dot\psi}$$

from which
$$\dot\varphi = \frac{\dot\psi\sin\gamma}{\sin(\theta - \gamma)} = \frac{\dot\psi\sin 28.187°}{-\sin 13.187°} = -2.0705\dot\psi$$

With $\dot\psi = 600$ rpm, $\dot\varphi = (-2.0705)(600)$ $\qquad |\dot\varphi| = 1242$ rpm (retrograde) ◀

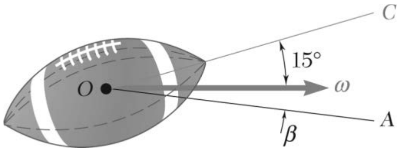
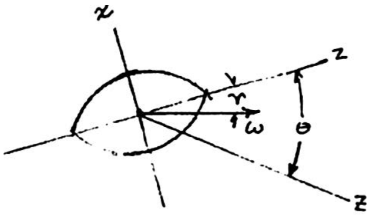
PROBLEM 18.125



The angular velocity vector of a football which has just been kicked is horizontal, and its axis of symmetry OC is oriented as shown. Knowing that the magnitude of the angular velocity is 200 rpm and that the ratio of the axis and transverse moments of inertia is $I/I' = \frac{1}{3}$, determine (*a*) the orientation of the axis of precession OA, (*b*) the rates of precession and spin.

SOLUTION



$$\tan\gamma = -\frac{\omega_x}{\omega_z}$$

$$\gamma = 15°$$

For steady precession with no force,

$$\tan\theta = \frac{I'}{I}\tan\gamma$$

$$= 3\tan 15°$$

$$\theta = 38.794°$$

(*a*) $\beta = \theta - \gamma = 38.794 - 15°$ $\qquad \beta = 23.8°$ ◀

(*b*) $\omega_x = -\dot{\varphi}\sin\theta = -\omega\sin\gamma$

$$\dot{\varphi} = \frac{\omega\sin\gamma}{\sin\theta} = \frac{(200\text{ rpm})\sin 15°}{\sin(38.794°)}$$

$= 82.621$ rpm $\qquad$ *precession*: $\dot{\varphi} = 82.6$ rpm ◀

$$\omega_z = \dot{\psi} + \dot{\varphi}\cos\theta = \omega\cos\gamma$$

$$\dot{\psi} = \omega\cos\gamma - \dot{\varphi}\cos\theta$$

$= 200\cos 15° - 82.621\cos 38.794°$ $\qquad$ *spin*: $\dot{\psi} = 128.8$ rpm ◀

PROBLEM 18.126

The space capsule has no angular velocity when the jet at A is activated for 1 s in a direction parallel to the x axis. Knowing that the capsule has a mass of 1000 kg, that its radii of gyration are $\bar{k}_z = \bar{k}_y = 1.00$ m and $\bar{k}_z = 1.25$ m, and that the jet at A produces a thrust of 50 N, determine the axis of precession and the rates of precession and spin after the jet has stopped.

SOLUTION

Initial angular momentum about the mass center:

$$\mathbf{H}_G = \bar{I}_x\omega_x\mathbf{i} + \bar{I}_y\omega_y\mathbf{j} + \bar{I}_z\omega_z\mathbf{k} = 0$$

Applied impulse at A: $\mathbf{A}\,\Delta t = (50\text{ N})(1\text{ s})\mathbf{i} = (50\text{ N}\cdot\text{s})\mathbf{i}$

Its moment about the mass center G:

$$\mathbf{r}_{A/G} \times \mathbf{A}\,\Delta t = [(2\text{ m})\mathbf{j} - (1.25\text{ m})\mathbf{k}] \times (50\text{ N}\cdot\text{s})\mathbf{i}$$
$$= -(100\text{ N}\cdot\text{m}\cdot\text{s})\mathbf{k} - (62.5\text{ N}\cdot\text{m}\cdot\text{s})\mathbf{j}$$

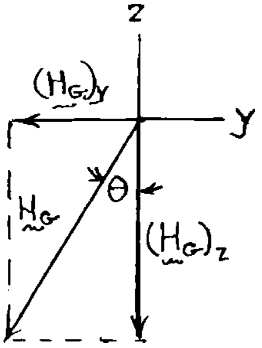
Principle of impulse and momentum. (Moments about G)

$$(\mathbf{H}_G)_0 = \mathbf{r}_{A/G} \times \mathbf{A}\,\Delta t = \mathbf{H}_G$$

where $\mathbf{H}_G$ is the final angular momentum about G.

$$0 + \mathbf{r}_{G/A} \times \mathbf{A}\,\Delta t = (H_G)_x\mathbf{i} + (H_G)_y\mathbf{j} + (H_G)_z\mathbf{k}$$

Angular momentum vector components:



$\mathbf{i}$: $\quad 0 = (H_G)_x$

$\mathbf{j}$: $\quad -62.5\text{ N}\cdot\text{m}\cdot\text{s} = (H_G)_y = -62.5\text{ kg}\cdot\text{m}^2/\text{s}$

$\mathbf{k}$: $\quad -100\text{ N}\cdot\text{m}\cdot\text{s} = (H_G)_z = -100\text{ kg}\cdot\text{m}^2/\text{s}$

$$\tan\theta = \frac{(H_G)_y}{(H_G)_z} = 0.625$$

$\theta = 32.005°$ ◀

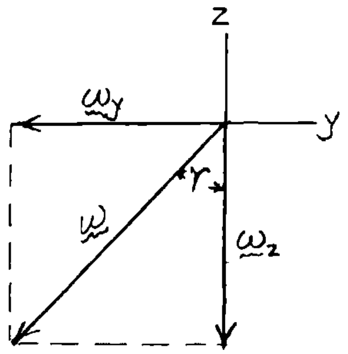
If you are a student using this Manual, you are using it without permission.*

PROBLEM 18.126 (Continued)

Moments of inertia:

$$\bar{I}_x = m\bar{k}_k^2 = (1000 \text{ kg})(1 \text{ m})^2 = 1000 \text{ kg} \cdot \text{m}^2$$
$$\bar{I}_y = m\bar{k}_y^2 = (1000 \text{ kg})(1 \text{ m})^2 = 1000 \text{ kg} \cdot \text{m}^2$$
$$\bar{I}_z = m\bar{k}_z^2 = (1000 \text{ kg})(1.25 \text{ m})^2 = 1562.5 \text{ kg} \cdot \text{m}^2$$

Angular velocity vector components:



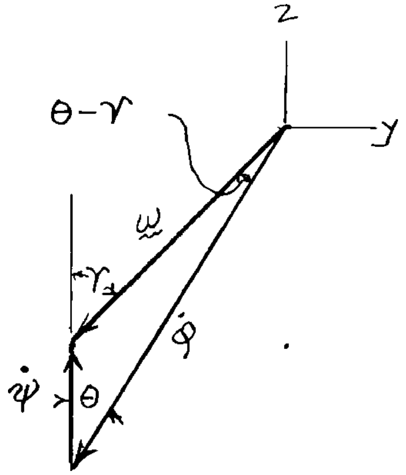
$$\omega_x = \frac{(H_G)_x}{\bar{I}_x} = 0$$
$$\omega_y = \frac{(H_G)_y}{\bar{I}_y} = \frac{-62.5}{1000} = -0.0625 \text{ rad/s}$$
$$\omega_z = \frac{(H_G)_z}{\bar{I}_z} = \frac{-100}{1562.5} = -0.0640 \text{ rad/s}$$
$$\tan\gamma = \frac{\omega_y}{\omega_z} = 0.97656 \qquad \gamma = 44.321^\circ$$
$$\omega = \sqrt{\omega_y^2 + \omega_z^2} = 0.089455 \text{ rad/s.}$$

Rates of precession and spin.

The angular velocity is resolved into a component $\dot{\varphi}$ (rate of precession) parallel to $\mathbf{H}_G$ and $\dot{\psi}$ (rate of spin) parallel to the axis of symmetry.

$$\gamma - \theta = 12.316^\circ$$

Law of sines:



$$\frac{\dot{\varphi}}{\sin\gamma} = \frac{\dot{\psi}}{\sin(\gamma-\theta)} = \frac{\omega}{\sin\theta}$$
$$\dot{\varphi} = \frac{\omega \sin\gamma}{\sin\theta} = \frac{0.089455 \sin 44.321^\circ}{\sin 32.005^\circ}$$
$$\dot{\psi} = \frac{\omega \sin(\gamma-\theta)}{\sin\theta} = \frac{0.089455 \sin 12.316^\circ}{\sin 32.005^\circ}$$

Rate of precession: $\dot{\varphi} = 0.1179$ rad/s $\qquad \dot{\varphi} = 1.126$ rpm ◀

Rate of spin: $\dot{\psi} = 0.0360$ rad/s $\qquad \dot{\psi} = 0.344$ rpm ◀

Since $\gamma > \theta$, the precession is <u>retrograde</u>.

PROBLEM 18.127

The space capsule has an angular velocity $\omega = (0.02 \text{ rad/s})\mathbf{j} + (0.10 \text{ rad/s})\mathbf{k}$ when the jet at B is activated for 1 s in a direction parallel to the x axis. Knowing that the capsule has a mass of 1000 kg, that its radii of gyration are $\bar{k}_z = \bar{k}_y = 1.00 \text{ m}$ and $\bar{k}_z = 1.25 \text{ m}$, and that the jet at B produces a thrust of 50 N, determine the axis of precession and the rates of precession and spin after the jet has stopped.

SOLUTION

Moments of inertia:

$$\bar{I}_x = m\bar{k}_k^2 = (1000 \text{ kg})(1 \text{ m})^2 = 1000 \text{ kg}\cdot\text{m}^2$$
$$\bar{I}_y = m\bar{k}_y^2 = (1000 \text{ kg})(1 \text{ m})^2 = 1000 \text{ kg}\cdot\text{m}^2$$
$$\bar{I}_z = m\bar{k}_z^2 = (1000 \text{ kg})(1.25 \text{ m})^2 = 1562.5 \text{ kg}\cdot\text{m}^2$$

Initial angular velocity: $(\omega_x)_0 = 0$

$(\omega_y)_0 = 0.02 \text{ rad/s}$

$(\omega_z)_0 = 0.10 \text{ rad/s}$

Initial angular momentum about G:

$$(\mathbf{H}_G)_0 = \bar{I}_x(\omega_x)_0\mathbf{i} + \bar{I}_y(\omega_y)_0\mathbf{j} + \bar{I}_z(\omega_z)_0\mathbf{k}$$
$$= (1000)(0)\mathbf{i} + (1000)(0.02)\mathbf{j} + (1562.5)(0.10)\mathbf{k}$$
$$= (20 \text{ kg}\cdot\text{m}^2/\text{s})\mathbf{j} + (156.25 \text{ kg}\cdot\text{m}^2/\text{s})\mathbf{k}$$

Applied impulse at B: $\mathbf{B}\,\Delta t = (50 \text{ N})(1 \text{ s})\mathbf{i} = (50 \text{ N}\cdot\text{s})\mathbf{i}$

Its moment about the mass center G:

$$\mathbf{r}_{B/G} \times \mathbf{B}\,\Delta t = [(1.25 \text{ m})\mathbf{j} + (2 \text{ m})\mathbf{k}] \times (50 \text{ N}\cdot\text{s})\mathbf{i}$$
$$= (100 \text{ N}\cdot\text{m}\cdot\text{s})\mathbf{j} - (62.5 \text{ N}\cdot\text{m}\cdot\text{s})\mathbf{k}$$

Principle of impulse and momentum. (Moments about G):

$$(\mathbf{H}_G)_0 + \mathbf{r}_{B/G} \times \mathbf{B}\,\Delta t = \mathbf{H}_G$$

where $\mathbf{H}_G$ is the final angular momentum about G.

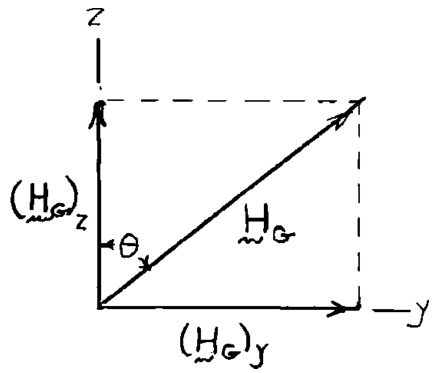
PROBLEM 18.127 (Continued)

Angular momentum vector components:



i: $0 + 0 = (H_G)_x = 0$

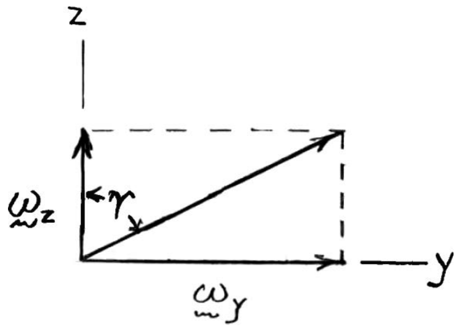
j: $20\ \text{kg}\cdot\text{m}^2/\text{s} + 100\ \text{N}\cdot\text{m}\cdot\text{s} = (H_G)_y = 120\ \text{kg}\cdot\text{m}^2/\text{s}$

k: $156.25\ \text{kg}\cdot\text{m}^2/\text{s} - 62.5\ \text{N}\cdot\text{m}\cdot\text{s} = (H_G)_z = 93.75\ \text{kg}\cdot\text{m}^2/\text{s}$

$$\tan\theta = \frac{(H_G)_y}{(H_G)_z} = 1.28$$

$\theta = 52.001°$ ◀

Angular velocity vector components:



$$\omega_x = \frac{(H_G)_x}{\bar{I}_x} = 0$$

$$\omega_y = \frac{(H_G)_y}{\bar{I}_y} = \frac{120}{1000} = 0.12\ \text{rad/s}$$

$$\omega_z = \frac{(H_G)_z}{\bar{I}_z} = \frac{93.75}{1562.5} = 0.060\ \text{rad/s}$$

$$\tan\gamma = \frac{\omega_y}{\omega_z} = 2.0000 \quad \gamma = 63.435°$$

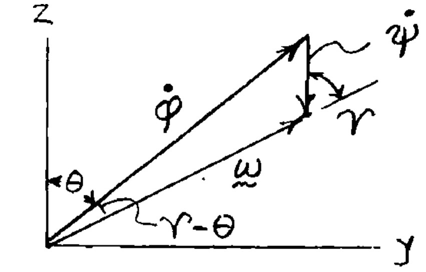
$$\omega = \sqrt{\omega_y^2 + \omega_z^2} = 0.134164\ \text{rad/s}$$

Rates of precession and spin.

The angular velocity is resolved into a component $\dot{\varphi}$ (rate of precession) parallel to $\mathbf{H}_G$ and $\dot{\psi}$ (rate of spin) parallel to the axis of symmetry.

$$\gamma - \theta = 11.434°$$

Law of sines:



$$\frac{\dot{\varphi}}{\sin\gamma} = \frac{\dot{\psi}}{\sin(\gamma-\theta)} = \frac{\omega}{\sin\theta}$$

$$\dot{\varphi} = \frac{\omega\sin\gamma}{\sin\theta} = \frac{0.134164\sin 63.435°}{\sin 52.001°}$$

$$\dot{\psi} = \frac{\omega\sin(\gamma-\theta)}{\sin\theta} = \frac{0.134164\sin 11.434°}{\sin 52.001°}$$

Rate of precession: $\dot{\varphi} = 0.1523\ \text{rad/s}$ ◀

Rate of spin: $\dot{\psi} = 0.0338\ \text{rad/s}$ ◀

Since $\gamma > \theta$, the precession is retrograde.

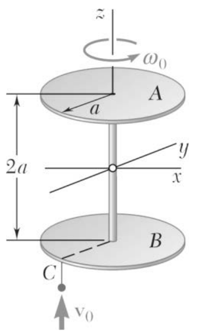
PROBLEM 18.128



Solve Sample Problem 18.6, assuming that the meteorite strikes the satellite at C with a velocity $\mathbf{v}_0 = (2000 \text{ m/s})\mathbf{i}$.

PROBLEM 18.6 A space satellite of mass m is known to be dynamically equivalent to two thin disks of equal mass. The disks are of radius a = 800 mm and are rigidly connected by a light rod of length $2a$. Initially the satellite is spinning freely about its axis of symmetry at the rate $\omega_0 = 60$ rpm. A meteorite, of mass $m_0 = m/1000$ and traveling with a velocity $\mathbf{v}_0$ of 2000 m/s relative to the satellite, strikes the satellite and becomes embedded at C. Determine (a) the angular velocity of the satellite immediately after impact, (b) the precession axis of the ensuing motion, (c) the rates of precession and spin of the ensuing motion.

SOLUTION

(a) *Angular velocity after impact.*

From Sample Problem 18.6:

$$I = I_z = \frac{1}{2}ma^2 \quad I' = I_x = I_y = \frac{5}{4}ma^2$$

Conservation of angular momentum: Angular momentum after impact:

$$\mathbf{H}_G = \mathbf{r}_C \times m_0\mathbf{v}_0 + I\omega_0\mathbf{k}$$
$$= (-a\mathbf{j} - a\mathbf{k}) \times m_0 v_0 \mathbf{i} + I\omega_0\mathbf{k}$$
$$= -am_0v_0\mathbf{j} + (I\omega_0 + am_0v_0)\mathbf{k}$$

<u>Data</u>: $a = 800 \text{ mm} = 0.8 \text{ m}$

$$\omega_0 = 60 \text{ rpm} = 2\pi \text{ rad/s}$$

$$v_0 = 2000 \text{ m/s}, \quad m_0 = \frac{m}{1000}$$

$$\omega_x = \frac{(H_G)_x}{I_x} = 0$$

$$\omega_y = \frac{(H_G)_y}{I_y} = -\frac{am_0v_0}{\frac{5}{4}ma^2} = -\frac{4}{5}\frac{m_0}{m}\frac{v_0}{a} = -\frac{4}{5}\left(\frac{1}{1000}\right)\frac{2000}{0.8} = -2 \text{ rad/s}$$

$$\omega_z = \frac{(H_G)_z}{I_z} = \omega_0 + \frac{am_0v_0}{\frac{1}{2}ma^2} = \omega_0 + 2\frac{m_0}{m}\frac{v_0}{a}$$

$$= 2\pi + 2\left(\frac{1}{1000}\right)\frac{2000}{0.8} = 11.2832 \text{ rad/s}$$

$$\boldsymbol{\omega} = -(2.00 \text{ rad/s})\mathbf{j} + (11.28 \text{ rad/s})\mathbf{k}$$

$$\omega = \sqrt{(2)^2 + (11.2832)^2} = 11.4591 \text{ rad/s} = 109.426 \text{ rpm}$$

$\omega = 109.4$ rpm ◀

PROBLEM 18.129

An 800-lb geostationary satellite is spinning with an angular velocity $\omega_0 = (1.5 \text{ rad/s})\mathbf{j}$ when it is hit at B by a 6-oz meteorite traveling with a velocity $\mathbf{v}_0 = -(1600 \text{ ft/s})\mathbf{i} + (1300 \text{ ft/s})\mathbf{j} + (4000 \text{ ft/s})\mathbf{k}$ relative to the satellite. Knowing that $b = 20$ in. and that the radii of gyration of the satellite are $\bar{k}_x = \bar{k}_z = 28.8$ in. and $\bar{k}_y = 32.4$ in., determine the precession axis and the rates of precession and spin of the satellite after the impact.

SOLUTION

Mass of satellite: $m = \dfrac{W}{g} = \dfrac{800}{32.2} = 24.845 \text{ lb} \cdot \text{s}^2/\text{ft}$

Principal moments of inertia:

$$\bar{I}_x = m k_x^2 = (24.845)\left(\frac{28.8}{12}\right)^2$$
$$= 143.106 \text{ lb} \cdot \text{s}^2 \cdot \text{ft}$$
$$\bar{I}_y = m k_y^2 = (24.845)\left(\frac{32.4}{12}\right)^2$$
$$= 181.118 \text{ lb} \cdot \text{s}^2 \cdot \text{ft}$$
$$\bar{I}_z = \bar{I}_x = 143.106 \text{ lb} \cdot \text{s}^2 \cdot \text{ft}$$

Mass of meteorite: $m' = \dfrac{6}{(16)(32.2)} = 0.011649 \text{ lb} \cdot \text{s}^2/\text{ft}$

Initial momentum of meteorite:

$$m'\mathbf{v}_0 = (0.011649)(-1600\mathbf{i} + 1300\mathbf{j} + 4000\mathbf{k})$$
$$= -(18.633 \text{ lb} \cdot \text{s})\mathbf{i} + (15.140 \text{ lb} \cdot \text{s})\mathbf{j} + (46.584 \text{ lb} \cdot \text{s})\mathbf{k}$$

Assume that the position of the mass center of the satellite plus the meteorite is essentially that of the satellite alone.

Position of Point B relative to the mass center:

$$\mathbf{r}_{B/G} = \left(\frac{42}{12}\mathbf{i} - \frac{20}{12}\mathbf{j}\right)$$
$$= (3.5 \text{ ft})\mathbf{i} - (1.66667 \text{ ft})\mathbf{j}$$

Angular velocity of satellite before impact:

$$\boldsymbol{\omega}_0 = (1.5 \text{ rad/s})\mathbf{j} \qquad (\omega_0)_x = (\omega_0)_z = 0, \quad (\omega_0)_y = 1.5 \text{ rad/s}$$

If you are a student using this Manual, you are using it without permission.*

Angular momentum of satellite-meteorite system before impact:

$$(\mathbf{H}_G)_0 = \bar{I}_y \omega_0 \mathbf{j} + \mathbf{r}_{B/G} \times (m'\mathbf{v}_0)$$

$$= (181.118)(1.5)\mathbf{j} + \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 3.5 & -1.66667 & 0 \\ -18.633 & 15.140 & 46.584 \end{vmatrix}$$

$$= -(77.64 \text{ lb}\cdot\text{s}\cdot\text{ft})\mathbf{i} + (108.637 \text{ lb}\cdot\text{s}\cdot\text{ft})\mathbf{j} + (21.935 \text{ lb}\cdot\text{s}\cdot\text{ft})\mathbf{k}$$

Principle of impulse and momentum for satellite-meteorite system. Moments about G:

$$(\mathbf{H}_G)_1 = (\mathbf{H}_G)_0 = \mathbf{H}_G$$

Angular velocity immediately after impact.

$$\boldsymbol{\omega} = \omega_x \mathbf{i} + \omega_y \mathbf{j} + \omega_z \mathbf{k}$$

Neglect the mass of the meteorite.

$$\mathbf{H}_G = \bar{I}_x \omega_x \mathbf{i} + \bar{I}_y \omega_y \mathbf{j} + \bar{I}_z \omega_z \mathbf{k}$$

$$\omega_x = \frac{(H_G)_x}{\bar{I}_x} = \frac{-77.64}{143.106} = -0.54253 \text{ rad/s}$$

$$\omega_y = \frac{(H_G)_y}{\bar{I}_y} = \frac{108.637}{181.118} = 0.59981 \text{ rad/s}$$

$$\omega_z = \frac{(H_G)_z}{\bar{I}_z} = \frac{21.934}{143.106} = 0.15327 \text{ rad/s}$$

$$\boldsymbol{\omega} = -(0.54253 \text{ rad/s})\mathbf{i} + (0.59981 \text{ rad/s})\mathbf{j} + (0.15327 \text{ rad/s})\mathbf{k}$$

$$\omega = \sqrt{(0.54253)^2 + (0.59981)^2 + (0.15327)^2} = 0.82317 \text{ rad/s}$$

$$H_G = \sqrt{(77.64)^2 + (108.637)^2 + (21.935)^2} = 135.319 \text{ lb}\cdot\text{s}\cdot\text{ft}$$

Motion after impact. Since the moments of inertia $\bar{I}_x$ and $\bar{I}_z$ are equal, the body moves as an axisymmetrical body with the y axis as the symmetry axis.

Moment of inertia about the symmetry axis: $I = \bar{I}_y = 181.118 \text{ lb}\cdot\text{s}^2\cdot\text{ft}$

Moment of inertia about a transverse axis through G: $I' = \bar{I}_x = \bar{I}_z = 143.106 \text{ lb}\cdot\text{s}^2\cdot\text{ft}$

The motion is a steady precession $\dot{\phi}$ about the precession axis together with a steady spin $\dot{\psi}$ about the spin or symmetry axis. Since $I > I'$, the precession is retrograde.

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. If you are a student using this Manual, you are using it without permission.*

Precession axis. The precession axis is directed along the angular momentum vector $\mathbf{H}_G$, which remains fixed. Immediately after impact, its direction cosines relative to the body axes x, y, z are:

$$\cos\theta_x = \frac{(H_G)_x}{H_G} = \frac{-77.64}{135.319} = -0.57376 \qquad \theta_x = 125.0° \blacktriangleleft$$

$$\cos\theta_y = \frac{(H_G)_y}{H_G} = \frac{108.637}{135.319} = 0.80282 \qquad \theta_y = 36.6° \blacktriangleleft$$

$$\cos\theta_z = \frac{(H_G)_z}{H_G} = \frac{21.935}{135.319} = 0.16210 \qquad \theta_z = 80.7° \blacktriangleleft$$

The angle θ between the spin axis (y axis) and the precession axis remains constant.

$$\theta = \theta_y = 36.600°$$

The angle γ between the angular velocity vector and the spin axis (y axis) is

$$\cos\gamma = \frac{\omega_y}{\omega} = \frac{0.59981}{0.82317} \qquad \gamma = 43.226°$$

The angle γ could also have been calculated from

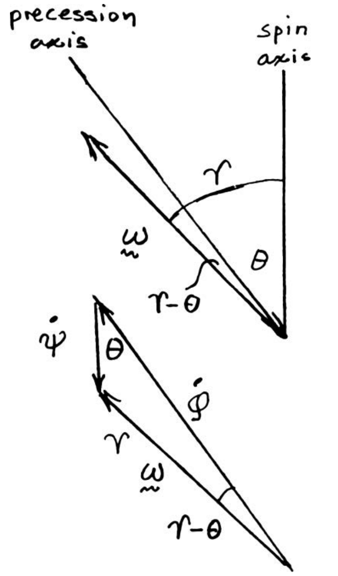
$$\tan\gamma = \frac{I}{I'}\tan\beta = \frac{181.118}{143.106}\tan 36.600°$$

The angle between the precession axis and the angular velocity vector is

$$\gamma - \theta = 6.626°$$

Rates of precession and spin.

Set up the triangle of vector addition for the components of angular velocity. Apply the law of sines.



$$\frac{\omega}{\sin\theta} = \frac{\dot{\psi}}{\sin(\gamma-\theta)} = \frac{\dot{\varphi}}{\sin\gamma}$$

$$\frac{0.82317}{\sin 36.600°} = \frac{\dot{\psi}}{\sin 6.626°} = \frac{\dot{\varphi}}{\sin 43.226°}$$

Rate of precession: $\dot{\varphi} = 0.946$ rad/s ◀

Rate of spin: $\dot{\psi} = 0.1593$ rad/s ◀

Since $\gamma > \theta$, precession is retrograde. ◀

PROBLEM 18.131

A homogeneous rectangular plate of mass m and sides c and $2c$ is held at A and B by a fork-ended shaft of negligible mass, which is supported by a bearing at C. The plate is free to rotate about AB, and the shaft is free to rotate about a horizontal axis through C. Knowing that, initially, $\theta_0 = 40°$, $\dot{\theta}_0 = 0$, and $\dot{\phi}_0 = 10$ rad/s, determine for the ensuring motion (a) the range of values of θ, (b) the minimum value of $\dot{\phi}$, (c) the maximum value of $\dot{\theta}$.

SOLUTION

Let the fixed Z axis lie along the axle of the fork-ended shaft. Let the axes $Gxyz$ be attached at the mass center with x perpendicular to the plate, y along the axle AB and z parallel to the long edges of the plate.

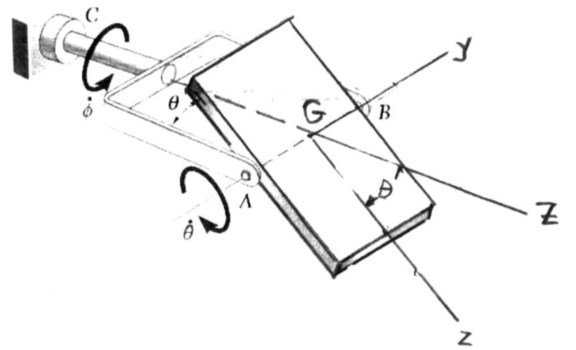
Angular velocity vector: $\dot{\boldsymbol{\omega}} = \dot{\varphi}\mathbf{k} + \dot{\theta}\mathbf{j}$

$$= \dot{\varphi}\cos\theta\mathbf{i} + \dot{\theta}\mathbf{j} + \dot{\varphi}\sin\theta\mathbf{k}$$

<u>Conservation of angular momentum</u>.

Since plate is free to rotate about Z axis,

$$H_Z = \text{constant} \quad (1)$$



But $H_Z = H_x \cos\theta + H_z \sin\theta$

$$H_Z = I_x\omega_x \cos\theta + I_z\omega_z \sin\theta$$

$$= \frac{1}{12}mc^2\dot{\phi}\cos^2\theta + \frac{5}{12}mc^2\dot{\phi}\sin^2\theta$$

$$= \frac{1}{12}mc^2\dot{\phi}(\cos^2\theta + 5\sin^2\theta)$$

$$= \frac{1}{12}mc^2\dot{\phi}(1 + 4\sin^2\theta)$$

Using the initial conditions, Eq. (1) yields

$$\dot{\phi}(1 + 4\sin^2\theta) = \dot{\phi}_0(1 + 4\sin^2\theta_0) \quad (2)$$

<u>Conservation of energy</u>.

Since no work is done, we have $T = \text{constant}$ (3)

where $T = \frac{1}{2}(I_x\omega_x^2 + I_y\omega_y^2 + I_z\omega_z^2)$

$$T = \frac{1}{2}\left(\frac{1}{12}mc^2\dot{\phi}^2\cos^2\theta + \frac{1}{3}mc^2\dot{\theta}^2 + \frac{5}{12}mc^2\dot{\phi}^2\sin^2\theta\right)$$

$$= \frac{1}{24}mc^2[4\dot{\theta}^2 + \dot{\phi}^2(\cos^2\theta + 5\sin^2\theta)]$$

$$= \frac{1}{24}mc^2[4\dot{\theta}^2 + \dot{\phi}^2(1 + 4\sin^2\theta)]$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. If you are a student using this Manual, you are using it without permission.*

Using the initial conditions, including $\dot{\theta}_0 = 0,$ Eq. (3) yields

$$4\dot{\theta}^2 + \dot{\phi}^2(1+4\sin^2\theta) = \dot{\phi}_0^2(1+4\sin^2\theta_0) \qquad (4)$$

(*a*) With $\theta_0 = 40°$ and $\dot{\phi}_0 = 10$ rad/s in. Eqs. (2) and (4),

$$\dot{\phi}(1+4\sin^2\theta) = 26.527$$

$$\dot{\phi} = \frac{26.527}{1+4\sin^2\theta} \qquad (2')$$

$$4\dot{\theta}^2 + \dot{\phi}^2(1+4\sin^2\theta) = 265.27$$

Eliminate $\dot{\phi}$ and solve for $\dot{\theta}^2$:

$$4\dot{\theta}^2 = 265.27 - \frac{(26.527)^2}{1+4\sin^2\theta} \qquad (5)$$

For $\dot{\theta}^2 = 0, \quad 1+4\sin^2\theta = \frac{(26.527)^2}{265.27} = 2.6527$

$$\sin^2\theta = 0.4132 \quad \sin\theta = 0.6428$$

From which $\theta = 40°$ and $140°$ $\qquad 40° < \theta < 140°$ ◀

(*b*) From Eq. (2′), $\dot{\phi}$ is minimum for $\theta = 90°.$

$\dot{\phi}_{\min} = 5.3054$ $\qquad \dot{\phi}_{\min} = 5.31$ rad/s ◀

(*c*) From Eq. (5),

$$\dot{\theta}^2 = 66.318 - \frac{175.92}{1+4\sin^2\theta}$$

$\dot{\theta}^2$ is maximum for $\theta = 90°.$

$\dot{\theta}_{\max}^2 = 31.134 \text{ rad}^2/\text{s}^2$ $\qquad \dot{\theta}_{\max} = 5.58$ rad/s ◀

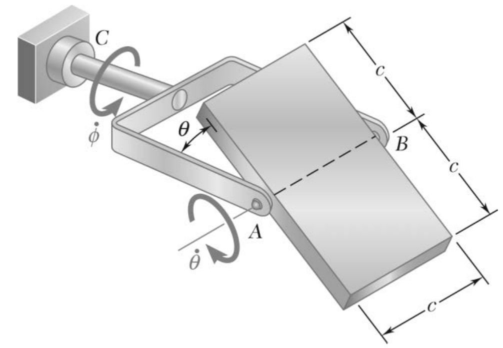
PROBLEM 18.132



A homogeneous rectangular plate of mass m and sides c and $2c$ is held at A and B by a fork-ended shaft of negligible mass which is supported by a bearing at C. The plate is free to rotate about AB, and the shaft is free to rotate about a horizontal axis through C. Initially the plate lies in the plane of the fork $(\theta_0 = 0)$ and the shaft has an angular velocity $\dot{\phi}_0 = 10\ \text{rad/s}$. If the plate is slightly disturbed, determine for the ensuring motion (*a*) the minimum value of $\dot{\phi}$, (*b*) the maximum value of $\dot{\theta}$.

SOLUTION

Let the fixed Z axis lie along the axle of the fork-ended shaft. Let the axes $Gxyz$ be attached at the mass center with x perpendicular to the plate, y along the axle AB and z parallel to the long edges of the plate.

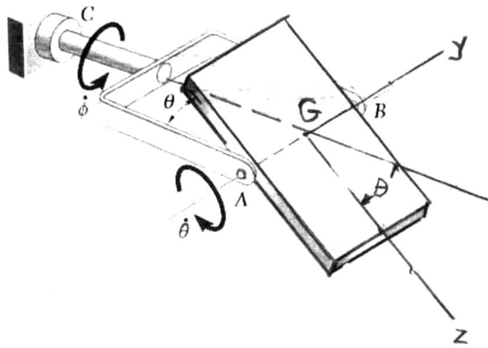
Angular velocity vector: $\dot{\boldsymbol{\omega}} = \dot{\varphi}\mathbf{k} + \dot{\theta}\mathbf{j}$

$$= \dot{\varphi}\cos\theta\mathbf{i} + \dot{\theta}\mathbf{j} + \dot{\varphi}\sin\theta\mathbf{k}$$

<u>Conservation of angular momentum</u>.

Since plate is free to rotate about Z axis,

$$H_Z = \text{constant} \qquad (1)$$



But $H_Z = H_x\cos\theta + H_z\sin\theta$

$$H_Z = I_x\omega_x\cos\theta + I_z\omega_z\sin\theta$$

$$= \frac{1}{12}mc^2\dot{\phi}\cos^2\theta + \frac{5}{12}mc^2\dot{\phi}\sin^2\theta$$

$$= \frac{1}{12}mc^2\dot{\phi}(\cos^2\theta + 5\sin^2\theta)$$

$$= \frac{1}{12}mc^2\dot{\phi}(1 + 4\sin^2\theta)$$

Using the initial conditions, Eq. (1) yields

$$\dot{\phi}(1 + 4\sin^2\theta) = \dot{\phi}_0(1 + 4\sin^2\theta_0) \qquad (2)$$

<u>Conservation of energy</u>.

Since no work is done, we have $T = \text{constant}$ (3)

where
$$T = \frac{1}{2}(I_x\omega_x^2 + I_y\omega_y^2 + I_z\omega_z^2)$$

$$T = \frac{1}{2}\left(\frac{1}{12}mc^2\dot{\phi}^2\cos^2\theta + \frac{1}{3}mc^2\dot{\theta}^2 + \frac{5}{12}mc^2\dot{\phi}^2\sin^2\theta\right)$$

$$= \frac{1}{24}mc^2[4\dot{\theta}^2 + \dot{\phi}^2(\cos^2\theta + 5\sin^2\theta)]$$

$$= \frac{1}{24}mc^2[4\dot{\theta}^2 + \dot{\phi}^2(1 + 4\sin^2\theta)]$$

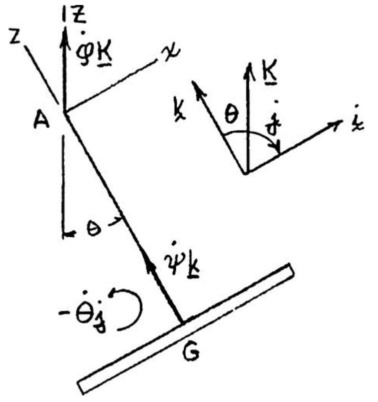
PROBLEM 18.133

A homogeneous disk of radius 180 mm is welded to a rod AG of length 360 mm and of negligible mass which is connected by a clevis to a vertical shaft AB. The rod and disk can rotate freely about a horizontal axis AC, and shaft AB can rotate freely about a vertical axis. Initially, rod AG is horizontal $(\theta_0 = 90°)$ and has no angular velocity about AC. Knowing that the maximum value $\dot{\phi}_m$ of the angular velocity of shaft AB in the ensuing motion is twice its initial value $\dot{\phi}_0$, determine (*a*) the minimum value of θ, (*b*) the initial angular velocity $\dot{\phi}_0$ of shaft AB.

SOLUTION

Let the Z axis be vertical.

For principal axes xyz with origin at A, the principal moments of inertia are



$$I' = I_x = I_y$$

$$= m\left[\frac{1}{4}a^2 + (2a)^2\right] = \frac{17}{4}ma^2$$

$$I = I_z = \frac{1}{2}ma^2$$

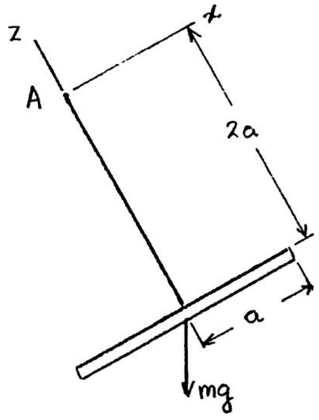
Angular velocity components: $\omega_x = \dot{\varphi}\sin\theta$

$$\omega_y = -\dot{\theta}$$

$$\omega_z = \dot{\psi} + \dot{\varphi}\cos\theta$$

Angular momentum about A: $\mathbf{H}_A = I_x\omega_x\mathbf{i} + I_y\omega_y\mathbf{j} + I_z\omega_z\mathbf{k}$

$$= I'\dot{\varphi}\sin\theta\mathbf{i} - I'\dot{\theta}\mathbf{j} + I\omega_z\mathbf{k}$$



Kinetic energy: $T = \frac{1}{2}I_x\omega_x^2 + \frac{1}{2}I_y\omega_y^2 + \frac{1}{2}I_z\omega_z^2$

$$T = \frac{1}{2}I'(\dot{\varphi}^2\sin^2\theta + \dot{\theta}^2) + \frac{1}{2}I\omega_z^2$$

Potential energy: $V = -2mga\cos\theta$

Conservation of angular momentum about fixed Z axis:

$$\mathbf{H}_A \cdot \mathbf{K} = \mathbf{H}_A \cdot (\mathbf{i}\sin\theta + \mathbf{k}\cos\theta)$$

$$= I'\dot{\varphi}\sin^2\theta + I\omega_z\cos\theta$$

$$= \frac{17}{4}ma^2\dot{\varphi}\sin^2\theta + \frac{1}{2}ma^2\omega_z\cos\theta = \alpha \quad (1)$$

where α is a constant.

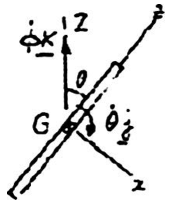
PROBLEM 18.135

The slender homogeneous rod AB of mass m and length L is free to rotate about a horizontal axle through its mass center G. The axle is supported by a frame of negligible mass which is free to rotate about the vertical CD. Knowing that, initially, $\theta = \theta_0$, $\dot{\theta} = 0$, and $\phi = \dot{\phi}_0$, show that the rod will oscillate about the horizontal axle and determine (a) the range of values of angle θ during this motion, (b) the maximum value of $\dot{\theta}$, (c) the minimum value of $\dot{\phi}$.

SOLUTION



Angular velocity.

Using the coordinate axes x, y, z shown (with y running *into* the paper), we have

$$\boldsymbol{\omega} = -\dot{\phi}\sin\theta\mathbf{i} + \dot{\theta}\mathbf{j} + \dot{\phi}\cos\theta\mathbf{k} \tag{1}$$

Moments of inertia.

For slender rod of length L are mass m:

$$\bar{I}_x = \bar{I}_y = \frac{1}{12}mL^2$$

$$\bar{I}_z = 0 \tag{2}$$

Conservation of energy.

Since the x, y, z axes are principal axis, we use

$$T = \frac{1}{2}\left(\bar{I}_x\omega_x^2 + \bar{I}_y\omega_y^2 + \bar{I}_z\omega_z^2\right) = \frac{1}{2}\left(\frac{1}{12}mL^2\dot{\phi}^2\sin^2\theta + \frac{1}{12}mL^2\dot{\theta}^2 + 0\right)$$

$$T = \frac{1}{24}mL^2(\dot{\phi}^2\sin^2\theta + \dot{\theta}^2) \tag{3}$$

Using a datum through G, we have $V = 0$.

$$T + V = \text{constant}: \quad \frac{1}{24}mL^2(\dot{\phi}^2\sin^2\theta + \dot{\theta}^2) = \text{constant}$$

Recalling the initial conditions $\theta = \theta_0$, $\dot{\theta} = 0$, $\dot{\varphi} = \dot{\phi}_0$, we determine the constant and write

$$\dot{\phi}^2\sin^2\theta + \dot{\theta}^2 = \dot{\phi}_0^2\sin^2\theta_0 \tag{4}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 18.135 (Continued)

Conservation of angular momentum.

Since the only forces exerted on the rod are its weight and the reaction at G, we have $\Sigma \mathbf{M}_G = 0$.

Using a fixed reference frame $GXYZ$, with Z directed vertically upward, we have from Eq. (18.2)

$$\dot{\mathbf{H}}_G = \Sigma \mathbf{M}_G = 0$$

or, integrating with respect to the frame $GXYZ$,

$$\mathbf{H}_G = \text{constant}$$

Considering the vertical component of $\mathbf{H}_G$,

$$H_Z = \text{constant}$$

But
$$H_Z = H_z \cos\theta - H_x \sin\theta = \bar{I}_z \omega_z \cos\theta - \bar{I}_x \omega_x \sin\theta$$
$$= 0 - \frac{1}{12} mL^2 (-\dot{\phi} \sin\theta) \sin\theta$$

Thus,
$$H_Z = \frac{1}{12} m L^2 \dot{\phi} \sin^2\theta = \text{constant}$$

Recalling the initial conditions, we obtain

$$\dot{\phi} \sin^2\theta = \dot{\phi}_0 \sin^2\theta_0 \qquad (5)$$

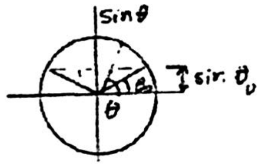
Solving Eq. (5) for $\dot{\phi}$ and substituting into Eq. (4):

$$\left(\frac{\dot{\phi}_0 \sin^2\theta_0}{\sin^2\theta} \right)^2 \sin^2\theta + \dot{\theta}^2 = \dot{\phi}_0 \sin^2\theta_0$$

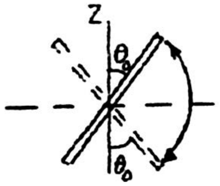
$$\dot{\theta}^2 = \dot{\phi}_0^2 \sin^2\theta_0 \left(1 - \frac{\sin^2\theta_0}{\sin^2\theta} \right) \qquad (6)$$

(*a*) Range of values of θ.

Since $\dot{\theta} \geq 0$, we must have



$$1 - \frac{\sin^2\theta_0}{\sin^2\theta} \geq 0$$
$$\sin^2\theta \geq \sin^2\theta_0$$
$$|\sin\theta| \geq |\sin\theta_0|$$



From trigonometric circle, we conclude that the range is

$$\theta_0 \leq \theta \leq 180° - \theta_0 \blacktriangleleft$$

Rod oscillates about axle and about horizontal line (dashed line).

If you are a student using this Manual, you are using it without permission.*

PROBLEM 18.135 (Continued)

(*b*) Maximum value of $\dot{\theta}$.

Referring to Eq. (6), we note that this occurs when $\sin\theta = 1$, that is, when $\theta = 90°$. We have

$$\dot{\theta}_{\max}^2 = \dot{\phi}_0^2 \sin^2\theta_0(1 - \sin^2\theta_0)$$
$$= \dot{\phi}_0^2 \sin^2\theta_0 \cos^2\theta_0$$

$$\dot{\theta}_{\max} = \dot{\phi}_0 \sin\theta_0 \cos\theta_0 \blacktriangleleft$$

(*c*) Minimum value of $\dot{\phi}_0$.

Referring to Eq. (5), we note that $\dot{\phi}$ is minimum when $\sin\theta = 1$, that is, when $\theta = 90°$.
We have

$$\dot{\phi}_{\min} = \dot{\phi}_0 \sin^2\theta_0 \blacktriangleleft$$

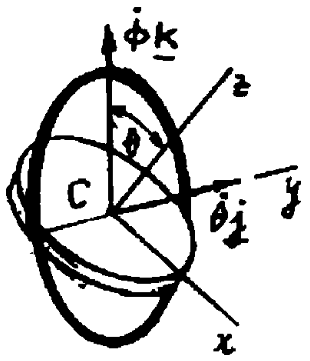
PROBLEM 18.136

The gimbal $ABA'B'$, is of negligible mass and may rotate freely about the vertical AA'. The uniform disk of radius a and mass m may rotate freely about its diameter BB', which is also the horizontal diameter of the gimbal. (a) Applying the principle of conservation of energy, and observing that, since $\Sigma M_{AA'} = 0,$ the component of the angular momentum of the disk along the fixed axis AA' must be constant, write two first-order differential equations defining the motion of the disk. (b) Given the initial conditions $\theta_0 \neq 0, \dot{\phi}_0 = 0,$ and $\dot{\theta}_0 = 0,$ express the rate of nutation $\dot{\theta}$ as a function of θ. (c) Show that the angle θ will never be larger than θ_0 during the ensuing motion.

SOLUTION

We use a reference frame $Cxyz$ attached to the disk as shown. The angular velocity of the disk is



$$\omega = \dot{\phi}\mathbf{k} + \dot{\theta}\mathbf{j}$$

$$\omega = -\dot{\phi}\sin\theta\,\mathbf{i} + \dot{\theta}\mathbf{j} + \dot{\phi}\cos\theta\,\mathbf{k}$$

(a) Conservation of energy: $T + V = \text{constant}$

Since $V = \text{constant}$, we have

$$T = \text{constant}.$$

For principal centroidal axes and $\bar{v} = 0$, the kinetic energy is given by

$$T = \frac{1}{2}(I_z\omega_z^2 + I_y\omega_y^2 + I_z\omega_z^2)$$

But $$I_x = I_y = \frac{1}{4}ma^2, \quad I_z = \frac{1}{2}ma^2$$

Using the components of $\boldsymbol{\omega}$ computed above:

$$T = \frac{1}{8}ma^2\dot{\phi}^2\sin^2\theta + \frac{1}{8}ma^2\dot{\theta}^2 + \frac{1}{4}ma^2\omega s^2\theta$$

$$T = \frac{1}{8}ma^2[(1+\cos^2\theta)\dot{\phi}^2 + \dot{\theta}^2]$$

We have therefore $$(1+\cos^2\theta)\dot{\phi}^2 + \dot{\theta}^2 = \text{constant} \qquad (1) ◀$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

We now determine the angular momentum $\mathbf{H}_C$:

$$\mathbf{H}_C = I_z\omega_x\mathbf{i} + I_y\omega_y\mathbf{j} + I_z\omega_z\mathbf{k}$$

$$= -\frac{1}{4}ma^2\dot{\phi}\sin\theta\mathbf{i} + \frac{1}{4}ma^2\dot{\theta}\mathbf{j} + \frac{1}{2}ma^2\dot{\phi}\cos\theta\mathbf{k}$$

Since $H_z =$ constant, we write

$$H_z = \mathbf{H}_C \cdot \mathbf{K} = \text{constant}$$

$$\frac{1}{4}ma^2(-\dot{\phi}\sin\theta\mathbf{i} + \dot{\theta}\mathbf{j} + 2\dot{\phi}\cos\theta\mathbf{k}) \cdot \mathbf{K} = \text{constant}$$

Since $\mathbf{i}\cdot\mathbf{K} = -\sin\theta,\quad \mathbf{j}\cdot\mathbf{K} = 0,\quad \mathbf{k}\cdot\mathbf{K} = \cos\theta,$ we have

$$\dot{\phi}\sin^2\theta + 2\dot{\phi}\cos^2\theta = \text{constant}$$

$$\dot{\phi}(1+\cos^2\theta) = \text{constant} \qquad (2) \blacktriangleleft$$

(*b*) We determine the constants in (1) and (2) from the initial conditions $\theta_0,\ \dot{\phi}_0,\ \dot{\theta}_0 = 0,$ and write

$$(1+\cos^2\theta)\dot{\phi}^2 + \dot{\theta}^2 = (1+\cos^2\theta_0)\dot{\phi}_0^2 \qquad (1')$$

$$\dot{\phi}(1+\cos^2\theta) = \dot{\phi}_0(1+\cos^2\theta_0) \qquad (2')$$

Solving (2′) for $\dot{\phi}$:

$$\dot{\phi} = \dot{\phi}_0\frac{1+\cos^2\theta_0}{1+\cos^2\theta}$$

Substituting into (1′):

$$\frac{(1+\cos^2\theta_0)^2}{1+\cos^2\theta}\dot{\phi}_0^2 + \dot{\theta}^2 = (1+\cos^2\theta_0)\dot{\phi}_0^2$$

$$\dot{\theta}^2 = \dot{\phi}_0^2(1+\cos^2\theta_0)\left(1-\frac{1+\cos^2\theta_0}{1+\cos^2\theta_0}\right)$$

$$\dot{\theta} = \dot{\phi}_0\sqrt{\frac{(1+\cos^2\theta_0)(\cos^2\theta-\cos^2\theta_0)}{1+\cos^2\theta}} \qquad \blacktriangleleft$$

(*c*) For $\dot{\theta}$ to be real, we need $\cos^2\theta_0 - \cos^2\theta_0 \geq 0$

Thus $\qquad |\cos\theta| \geq |\cos\theta_0|$

Assuming that the axes have been chosen so that $\theta_0 \leq 90°$, we must have

$$\cos\theta \geq \cos\theta_0 \qquad \theta \leq \theta_0 \blacktriangleleft$$

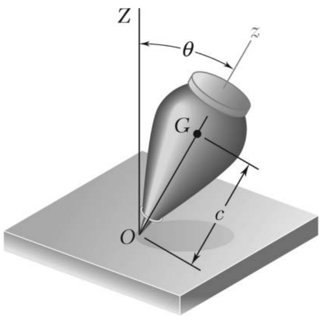
PROBLEM 18.137*



The top shown is supported at the fixed Point O. Denoting by ϕ, θ, and ψ the Eulerian angles defining the position of the top with respect to a fixed frame of reference, consider the general motion of the top in which all Eulerian angles vary.

(*a*) Observing that $\Sigma M_Z = 0$ and $\Sigma M_z = 0$, and denoting by I and I', respectively, the moments of inertia of the top about its axis of symmetry and about a transverse axis through O, derive the two first-order differential equations of motion

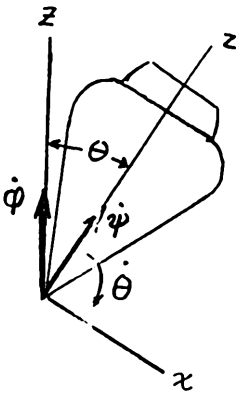
$$I'\dot{\phi}\sin^2\theta + I(\dot{\psi} + \dot{\phi}\cos\theta)\cos\theta = \alpha$$

$$I(\dot{\psi} + \dot{\phi}\cos\theta) = \beta$$

where α and β are constants depending upon the initial conditions. These equations express that the angular momentum of the top is conserved about both the Z and z axes, i.e., that the rectangular component of $\mathbf{H}_O$ along each of these axes is constant.

(*b*) Use Eqs. (1) and (2) to show that the rectangular component ω_z of the angular velocity of the top is constant and that the rate of precession $\dot{\phi}$ depends upon the value of the angle of nutation θ.

SOLUTION



Use a rotating frame of reference with the y axis pointing into the paper.

Angular velocity of the frame:

$$\mathbf{\Omega} = -\dot{\phi}\sin\theta\mathbf{i} + \dot{\theta}\mathbf{j} + \dot{\phi}\cos\theta\mathbf{k}$$

Angular velocity of the top:

$$\boldsymbol{\omega} = -\dot{\phi}\sin\theta\mathbf{i} + \dot{\theta}\mathbf{j} + (\dot{\psi} + \dot{\phi}\cos\theta)\mathbf{k}$$

Its angular momentum about O:

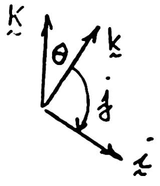
$$\mathbf{H}_O = I_x\omega_x\mathbf{i} + I_y\omega_y\mathbf{j} + I_z\omega_z\mathbf{k}$$

$$= -I'\dot{\phi}\sin\theta\mathbf{i} + I'\dot{\theta}\mathbf{j} + I(\dot{\psi} + \dot{\phi}\cos\theta)\mathbf{k}$$

where $\quad I_x = I_y = I' \quad$ and $\quad I_z = I.$

The moment $\mathbf{M}_O$ about O is due to the weight mg.

$$\mathbf{M}_0 = mgc\sin\theta\mathbf{j}$$



(*a*) Since the fixed Z axis refers to a Newtonian frame of reference and $(M_O)_Z = 0,$ it follows that $(H_O)_Z$ is constant. Thus,

$$(H_O)_Z = \mathbf{H}_O \cdot \mathbf{K} = \mathbf{H}_O \cdot (-\mathbf{i}\sin\theta + \mathbf{k}\cos\theta)$$

$$= I'\dot{\phi}\sin^2\theta + I(\dot{\psi} + \dot{\phi}\cos\theta)\cos\theta = \alpha \qquad (1) ◀$$

where α is a constant.

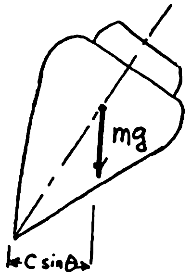
PROBLEM 18.137* (Continued)



$$\mathbf{M}_O = \dot{\mathbf{H}}_O = (\dot{\mathbf{H}}_O)_{Oxyz} + \mathbf{\Omega} \times \mathbf{H}_O$$

$$mgc\sin\theta\mathbf{j} = -I'\frac{d}{dt}(\dot{\phi}\sin\theta)\mathbf{i} + I'\ddot{\theta}\mathbf{j} + I\frac{d}{dt}(\dot{\psi} + \dot{\phi}\cos\theta)\mathbf{k}$$
$$+[I(\dot{\psi} + \dot{\phi}\cos\theta)\dot{\theta} - I'\dot{\phi}\dot{\theta}\cos\theta]\mathbf{i}$$
$$+[I(\dot{\psi} + \dot{\phi}\cos\theta)\dot{\phi}\sin\theta - I'\dot{\phi}^2\sin\theta\cos\theta]\mathbf{j}$$

z-components: $\quad 0 = \dfrac{d}{dt}(\dot{\psi} + \dot{\phi}\cos\theta)$

Integrating, $\quad I(\dot{\psi} + \dot{\phi}\cos\theta) = \beta \quad (2)$ ◀

where β is a constant.

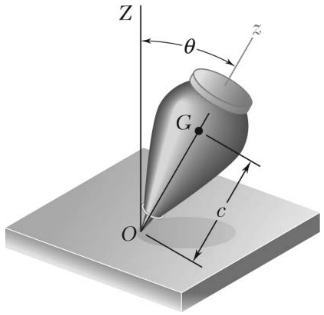
(*b*) Since $\quad \omega_z = \dot{\psi} + \dot{\phi}\cos\theta \qquad \omega_z = \dfrac{\beta}{I} = \text{constant} \quad (3)$ ◀

From Eqs. (1) and (2), $\quad I'\dot{\phi}\sin^2\theta + \beta\cos\theta = \alpha \qquad \dot{\phi} = \dfrac{\alpha - \beta\cos\theta}{I'\sin^2\theta} \quad (4)$ ◀

which is a function of θ.

If you are a student using this Manual, you are using it without permission.*

PROBLEM 18.138*



(*a*) Applying the principle of conservation of energy, derive a third differential equation for the general motion of the top of Problem 18.137.

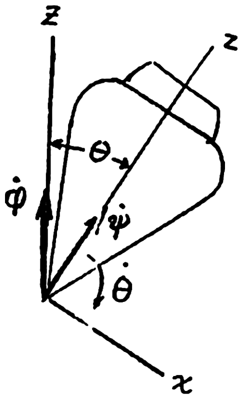
(*b*) Eliminating the derivatives $\dot{\phi}$ and $\dot{\psi}$ from the equation obtained and from the two equations of Problem 18.139, show that the rate of nutation $\dot{\theta}$ is defined by the differential equation $\dot{\theta}^2 = f(\theta)$, where

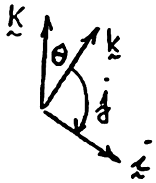
$$f(\theta) = \frac{1}{I'}\left(2E - \frac{\beta^2}{I} - 2mgc\cos\theta\right) - \left(\frac{\alpha - \beta\cos\theta}{I'\sin\theta}\right)^2$$

(*c*) Further show, by introducing the auxiliary variable $x = \cos\theta$, that the maximum and minimum values of θ can be obtained by solving for x the cubic equation

$$\left(2E - \frac{\beta^2}{I} - 2mgcx\right)(1 - x^2) - \frac{1}{I'}(\alpha - \beta x)^2 = 0$$

SOLUTION





(*a*) Angular velocity of the top:

$$\boldsymbol{\omega} = -\dot{\varphi}\sin\theta\mathbf{i} + \dot{\theta}\mathbf{j} + (\dot{\psi} + \dot{\varphi}\cos\theta)\mathbf{k}$$

Kinetic energy:

$$T = \frac{1}{2}I_x\omega_x^2 + \frac{1}{2}I_y\omega_y^2 + \frac{1}{2}I_z\omega_z^2$$
$$= \frac{1}{2}I'(\dot{\varphi}\sin\theta)^2 + \frac{1}{2}I'\dot{\theta}^2 + \frac{1}{2}I_z\omega_z^2$$

Potential energy: $V = mgc\cos\theta$

Principle of conservation of energy: $T + V = E$

$$\frac{1}{2}I'(\dot{\varphi}\sin\theta)^2 + \frac{1}{2}I'\dot{\theta}^2 + \frac{1}{2}I\omega_z^2 + mgc\cos\theta = E \blacktriangleleft$$

(*b*) Solving for $\dot{\theta}^2$,

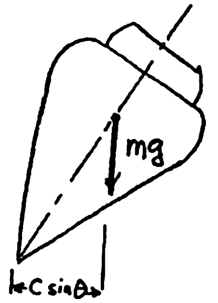
$$\dot{\theta}^2 = \frac{1}{I'}(2E - I_z\omega_z^2 - 2mgc\cos\theta) - (\dot{\varphi}\sin\theta)^2 \qquad \text{(A)}$$

Equation (2) of Problem 18.137, with $\omega_z = \dot{\psi} + \dot{\varphi}\cos\theta$ gives

$$I_z\omega_z^2 = \frac{\beta^2}{I} \qquad \text{(B)}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 18.138* (Continued)



Equation (1) of Problem 18.137 gives

$$I'\dot{\varphi}\sin^2\theta + \beta\cos\theta = \alpha \qquad \text{(C)}$$

$$\dot{\varphi} = \frac{\alpha - \beta\cos\theta}{I'\sin^2\theta} \qquad \text{(D)}$$

Substituting Equations (D) and (B) into Equation (A),

$$\dot{\theta}^2 = f(\theta)$$

where $f(\theta) = \frac{1}{I'}\left(2E - \frac{\beta^2}{I} - 2mgc\cos\theta\right) - \left(\frac{\alpha - \beta\cos\theta}{I'\sin\theta}\right)^2$ (1) ◀

(*c*) Maximum and minimum values of θ occur when $f(\theta) = 0.$ Setting $\cos\theta = x$ and $\sin^2\theta = 1 - x^2$ in Equation (1), and letting $f(\theta) = 0$ gives

$$\frac{1}{I'}\left(2E - \frac{\beta^2}{I} + 2mgcx\right) - \frac{(\alpha - \beta x)^2}{(I')^2(1 - x^2)} = 0$$

Multiplying by $I'(1 - x^2)$ gives the cubic equation $F(x) = 0$:

$$\left(2E - \frac{\beta^2}{I} - 2mgcx\right)(1 - x^2) - \frac{1}{I'}(\alpha - \beta x)^2 = 0 \qquad \text{(2) ◀}$$

Solving this equation will yield three values of x. The two values lying between −1 and +1 correspond to the maximum and minimum values of θ.

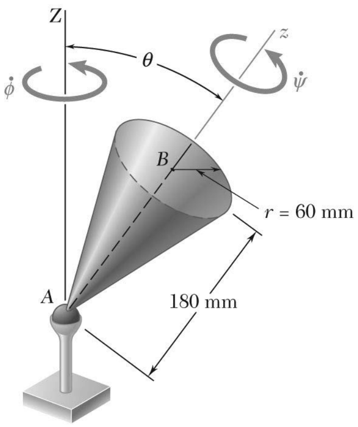
PROBLEM 18.139



A solid cone of height 180 mm with a circular base of radius 60 mm is supported by a ball and socket at A. The cone is released from the position $\theta_0 = 30°$ with a rate of spin $\dot{\psi}_0 = 300$ rad/s, a rate of precession $\dot{\phi}_0 = 20$ rad/s, and a zero rate of nutation. Determine (*a*) the maximum value of θ in the ensuing motion, (*b*) the corresponding values of the rates of spin and precession. [*Hint:* Use Eq. (2) of Prob. 18.138; you can either solve this equation numerically or reduce it to a quadratic equation, since one of its roots is known.]

SOLUTION

Data: $r = 60 \text{ mm} = 0.06 \text{ m}, \quad h = 180 \text{ mm} = 0.18 \text{ m}, \quad c = \frac{3}{4}h = 0.135 \text{ m},$

$$\theta_0 = 30°, \quad \dot{\psi}_0 = 300 \text{ rad/s}, \quad \dot{\phi}_0 = 20 \text{ rad/s}, \quad \dot{\theta}_0 = 0$$

Calculate the following:

$$\frac{I}{m} = \frac{3}{10}r^2 = \frac{3}{10}(0.06)^2 = 1.08 \times 10^{-3} \text{ m}^2$$

$$\frac{I'}{m} = \frac{3}{5}\left(\frac{1}{4}r^2 + h^2\right) = \frac{3}{5}\left[\frac{1}{4}(0.06)^2 + (0.18)^2\right] = 19.98 \times 10^{-3} \text{ m}^2$$

Initially, $\omega_x = -\dot{\phi}_0 \sin\theta_0 = -20\sin 30° = -10 \text{ rad/s}, \quad \omega_y = \dot{\theta}_0 = 0$

$$\omega_z = \dot{\psi}_0 + \dot{\phi}_0 \cos\theta_0 = 300 + 20\cos 30° = 317.32 \text{ rad/s}$$

$$\frac{T}{m} = \frac{1}{2}\frac{I'}{m}(\omega_x^2 + \omega_y^2) + \frac{1}{2}\frac{I}{m}\omega_z^2$$

$$= \frac{1}{2}(19.98 \times 10^{-3})(10^2 + 0) + \frac{1}{2}(1.08 \times 10^{-3})(317.32)^2 = 55.3728 \text{ m}^2/\text{s}^2$$

$$\frac{V}{m} = gc\cos\theta_0 = (9.81)(0.135)\cos 30° = 1.1469 \text{ m}^2/\text{s}^2$$

$$\frac{2E}{m} = 2(55.3728 + 1.1469) = 113.0394 \text{ m}^2/\text{s}^2$$

$$\frac{\beta}{m} = \frac{I}{m}\omega_z = (1.08 \times 10^{-3})(317.32) = 0.342706 \text{ m}^2/\text{s}$$

$$\frac{\alpha}{m} = \frac{I'}{m}\dot{\phi}_0 \sin^2\theta_0 + \beta\cos\theta_0$$

$$= (19.98 \times 10^{-3})(20)\sin^2 30° + 0.342706\cos 30°$$

$$= 0.396692 \text{ m}^2/\text{s}$$

PROBLEM 18.140

A solid cone of height 180 mm with a circular base of radius 60 mm is supported by a ball and socket at *A*. The cone is released from the position $\theta_0 = 30°$ with a rate of spin $\dot{\psi}_0 = 300$ rad/s, a rate of precession $\dot{\phi}_0 = -4$ rad/s, and a zero rate of nutation. Determine (*a*) the maximum value of θ in the ensuing motion, (*b*) the corresponding values of the rates of spin and precession, (*c*) the value of θ for which the sense of the precession is reversed. (See hint of Problem 18.139.)

SOLUTION

Data: $r = 60 \text{ mm} = 0.06 \text{ m}, \quad h = 180 \text{ mm} = 0.18 \text{ m}, \quad c = \frac{3}{4}h = 0.135 \text{ m},$

$$\theta_0 = 30°, \quad \dot{\psi}_0 = 300 \text{ rad/s}, \quad \dot{\phi}_0 = -4 \text{ rad/s}, \quad \dot{\theta}_0 = 0$$

Calculate the following:

$$\frac{I}{m} = \frac{3}{10}r^2 = \frac{3}{10}(0.06)^2 = 1.08\times 10^{-3}\text{ m}^2$$

$$\frac{I'}{m} = \frac{3}{5}\left(\frac{1}{4}r^2 + h^2\right) = \frac{3}{5}\left[\frac{1}{4}(0.06)^2 + (0.18)^2\right] = 19.98\times 10^{-3}\text{ m}^2$$

Initially, $\omega_x = -\dot{\phi}_0 \sin\theta_0 = -(-4)\sin 30° = 2 \text{ rad/s}, \qquad \omega_y = \dot{\theta}_0 = 0$

$$\omega_z = 300 + (-4)\cos 30° = 296.536 \text{ rad/s}$$

$$\frac{T}{m} = \frac{1}{2}\frac{I'}{m}(\omega_x^2 + \omega_y^2) + \frac{1}{2}\frac{I}{m}\omega_z^2$$

$$= \frac{1}{2}(19.98\times 10^{-3})((2)^2 + 0) + \frac{1}{2}(1.08\times 10^{-3})(296.536)^2 = 47.5241 \text{ m}^2/\text{s}^2$$

$$\frac{V}{m} = gc\cos\theta = (9.81)(0.135)\cos 30° = 1.1469 \text{ m}^2/\text{s}^2$$

$$\frac{2E}{m} = 2(47.5241 + 1.1469) = 97.3419 \text{ m}^2/\text{s}^2$$

$$\frac{\beta}{m} = \frac{I}{m}\omega_z = (1.08\times 10^{-3})(296.536) = 0.320259 \text{ m}^2/\text{s}$$

$$\frac{\alpha}{m} = \frac{I'}{m}\dot{\phi}_0 \sin^2\theta_0 + \beta\cos\theta_0$$

$$= (19.98\times 10^{-3})(-4)\sin^2 30° + 0.320259\cos 30°$$

$$= 0.257372 \text{ m}^2/\text{s}$$

PROBLEM 18.141*

A homogeneous sphere of mass m and radius a is welded to a rod AB of negligible mass, which is held by a ball-and-socket support at A. The sphere is released in the position $\beta = 0$ with a rate of precession $\dot{\phi}_0 = \sqrt{17g/11a}$ with no spin or nutation. Determine the largest value of β in the ensuing motion.

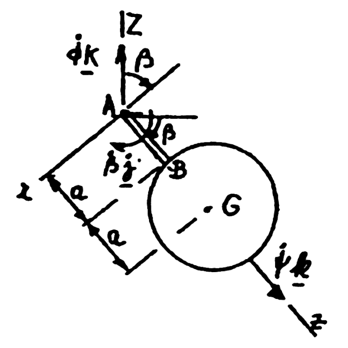
SOLUTION

<u>Conservation of angular momentum about the Z and z axes</u>.

Since the only external forces are the weight of the sphere and the reaction at A, a reasoning similar to that used in Problem 18.109 shows that the angular momentum is conserved about the Z and z axes.

Choosing the principal axes $Axyz$ shown (with y horizontal and pointing into the paper), we have

$$\boldsymbol{\omega} = -\dot{\phi}\cos\beta\mathbf{i} + \dot{\beta}\mathbf{j} + (\dot{\psi} - \dot{\phi}\sin\beta)\mathbf{k}$$



The moments of inertia are

$$I_z = \frac{2}{5}ma^2$$

$$I_x = I_y = \frac{2}{5}ma^2 + m(2a)^2 = \frac{22}{5}ma^2$$

Angular momentum about A:

$$\mathbf{H}_A = I_x\omega_x\mathbf{i} + I_y\omega_y\mathbf{j} + I_z\omega_z\mathbf{k}$$

$$\mathbf{H}_A = -\frac{22}{5}ma^2\dot{\phi}\cos\beta\mathbf{i} + \frac{22}{5}ma^2\dot{\beta}\mathbf{j} + \frac{2}{5}ma^2(\dot{\psi} - \dot{\phi}\sin\beta)\mathbf{k}$$

We write $\mathbf{H}_z = \text{constant}$, or $\mathbf{H}_A \cdot \mathbf{K} = \text{constant}$

Since $\mathbf{i}\cdot\mathbf{K} = -\cos\beta$, $\quad \mathbf{j}\cdot\mathbf{K} = 0$, $\quad \mathbf{k}\cdot\mathbf{K} = -\sin\beta$

$$\mathbf{H}_0 \cdot \mathbf{K} = -\frac{22}{5}ma^2\dot{\phi}\cos\beta(-\cos\beta)$$

$$+\frac{2}{5}ma^2(\dot{\psi} - \dot{\phi}\sin\beta)(-\sin\beta) = \text{constant}$$

With the initial conditions $\dot{\phi} = \dot{\phi}_0$, $\dot{\psi} = \dot{\beta} = 0$, $\beta = 0$, we find that the constant is $\frac{22}{5}ma^2\dot{\phi}_0$. Thus,

$$11\dot{\phi}\cos^2\beta - (\dot{\psi} - \dot{\phi}\sin\beta)\sin\beta = 11\dot{\phi}_0 \qquad (1)$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 18.141* (Continued)

We now write $H_z = \text{constant}$:

$$H_z = \frac{2}{5}ma^2(\dot{\psi} - \dot{\phi}\sin\beta) = \text{constant}$$

and, from the initial conditions, we find that the constant is zero. Thus,

$$\dot{\psi} - \dot{\phi}\sin\beta = 0 \qquad (2)$$

Conservation of energy.

We have

$$T = \frac{1}{2}(I_x\omega_x^2 + I_y\omega_y^2 + I_z\omega_z^2)$$

$$T = \frac{1}{2}\left[\frac{22}{5}ma^2\dot{\phi}^2\cos^2\beta + \frac{22}{5}ma^2\dot{\beta}^2 + \frac{2}{5}ma^2(\dot{\psi} - \dot{\phi}\sin\beta)^2\right]$$

and selecting the datum at $\beta = 0$:

$$V = -2mga\sin\beta$$

$T + V = \text{constant}$: $\quad \frac{1}{2}\left[\frac{22}{5}ma^2\dot{\phi}^2\cos^2\beta + \frac{22}{5}ma^2\dot{\beta}^2 + \frac{2}{5}ma^2(\dot{\psi} - \dot{\phi}\sin\beta)^2\right] - 2mga\sin\beta = \text{constant}$

From the initial conditions $\dot{\phi} = \dot{\phi}_0$, $\dot{\psi} = \dot{\beta} = 0$, $\beta = 0$, we find that the constant is $\frac{11}{5}ma^2\dot{\phi}_0^2$. Thus,

$$11\dot{\phi}^2\cos^2\beta + 11\dot{\beta}^2 + (\dot{\psi} - \dot{\phi}\sin\beta)^2 - 10\frac{g}{a}\sin\beta = 11\dot{\phi}_0^2 \qquad (3)$$

Substituting for $\dot{\psi} - \dot{\phi}\sin\beta$ from Eq. (2) into Eqs. (1) and (3):

Eq. (1): $$11\dot{\phi}\cos^2\beta = 11\dot{\phi}_0 \qquad (1')$$

Eq. (3): $$11\dot{\phi}^2\cos^2\beta + 11\dot{\beta}^2 - 10\frac{g}{a}\sin\beta = 11\dot{\phi}_0^2 \qquad (3')$$

Solving $(1')$ for $\dot{\phi}$,

$$\dot{\phi} = \dot{\phi}_0\sec^2\beta \qquad (4)$$

Substituting for $\dot{\phi}$ from Eq. (4) into Eq. $(3')$:

$$11(\dot{\phi}_0\sec^2\theta)^2\cos^2\beta + 11\dot{\beta}^2 - 10\frac{g}{a}\sin\beta = 11\dot{\phi}_0^2 \qquad (5)$$

For the maximum value of β, we have $\dot{\beta} = 0$ and Eq. (5) yields

$$\dot{\phi}_0^2\left(\frac{1}{\cos^2\theta} - 1\right) = \frac{10}{11}\frac{g}{a}\sin\beta$$

$$\dot{\phi}_0^2 = \frac{10}{11}\frac{g}{a}\frac{\cos^2\beta}{\sin\beta} \qquad (6)$$

If you are a student using this Manual, you are using it without permission.*

PROBLEM 18.141* (Continued)

Given data: $\dot{\phi}_0^2 = \frac{17}{11}\frac{g}{a}\cdot$ Substituting into Eq. (6),

$$\frac{17}{11}\frac{g}{a} = \frac{10}{11}\frac{g}{a}\frac{\cos^2\beta}{\sin\beta} \qquad \cos^2\beta = 1.7\sin\beta$$

Letting $\cos^2\beta = 1 - \sin^2\beta$, we have

$$\sin^2\beta + 1.7\sin\beta - 1 = 0$$

Solving the quadratic,

$$\sin\beta = -2.162 \text{ (impossible)} \quad \text{and} \quad \sin\beta = 0.46244 \qquad \beta_{max} = 27.5° \blacktriangleleft$$

PROBLEM 18.142*

A homogeneous sphere of mass m and radius a is welded to a rod AB of negligible mass, which is held by a ball-and-socket support at A. The sphere is released in the position $\beta = 0$ with a rate of precession $\dot{\phi} = \dot{\phi}_0$ with no spin or nutation. Knowing that the largest value of β in the ensuing motion is 30°, determine (*a*) the rate of precession $\dot{\phi}_0$ of the sphere in its initial position, (*b*) the rates of precession and spin when $\beta = 30°$.

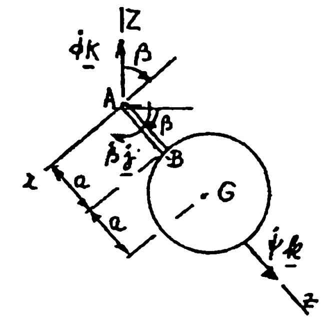
SOLUTION

<u>Conservation of angular momentum about the Z and z axes</u>.

Since the only external forces are the weight of the sphere and the reaction at A, a reasoning similar to that used in Problem 18.109 shows that the angular momentum is conserved about the Z and z axes.

Choosing the principal axes $Axyz$ shown (with y horizontal and pointing into the paper), we have

$$\boldsymbol{\omega} = -\dot{\phi}\cos\beta\mathbf{i} + \dot{\beta}\mathbf{j} + (\dot{\psi} - \dot{\phi}\sin\beta)\mathbf{k}$$



The moments of inertia are

$$I_z = \frac{2}{5}ma^2$$

$$I_x = I_y = \frac{2}{5}ma^2 + m(2a)^2 = \frac{22}{5}ma^2$$

Angular momentum about A:

$$\mathbf{H}_A = I_x\omega_x\mathbf{i} + I_y\omega_y\mathbf{j} + I_z\omega_z\mathbf{k}$$

$$\mathbf{H}_A = -\frac{22}{5}ma^2\dot{\phi}\cos\beta\mathbf{i} + \frac{22}{5}ma^2\dot{\beta}\mathbf{j} + \frac{2}{5}ma^2(\dot{\psi} - \dot{\phi}\sin\beta)\mathbf{k}$$

We write $\mathbf{H}_Z = \text{constant}$, or $\mathbf{H}_A \cdot \mathbf{K} = \text{constant}$

Since $\mathbf{i}\cdot\mathbf{K} = -\cos\beta$, $\mathbf{j}\cdot\mathbf{K} = 0$, $\mathbf{k}\cdot\mathbf{K} = -\sin\beta$

$$\mathbf{H}_0 \cdot \mathbf{K} = -\frac{22}{5}ma^2\dot{\phi}\cos\beta(-\cos\beta)$$

$$+\frac{2}{5}ma^2(\dot{\psi} - \dot{\phi}\sin\beta)(-\sin\beta) = \text{constant}$$

With the initial conditions $\dot{\phi} = \dot{\phi}_0$, $\dot{\psi} = \dot{\beta} = 0$, $\beta = 0$, we find that the constant is $\frac{22}{5}ma^2\dot{\phi}_0$. Thus,

$$11\dot{\phi}\cos^2\beta - (\dot{\psi} - \dot{\phi}\sin\beta)\sin\beta = 11\dot{\phi}_0 \qquad (1)$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 18.142* (Continued)

We now write $H_z = \text{constant}$:

$$H_z = \frac{2}{5}ma^2(\dot{\psi} - \dot{\phi}\sin\beta) = \text{constant}$$

and, from the initial conditions, we find that the constant is zero. Thus,

$$\dot{\psi} - \dot{\phi}\sin\beta = 0 \tag{2}$$

<u>Conservation of energy</u>.

We have

$$T = \frac{1}{2}(I_x\omega_x^2 + I_y\omega_y^2 + I_z\omega_z^2)$$

$$T = \frac{1}{2}\left[\frac{22}{5}ma^2\dot{\phi}^2\cos^2\beta + \frac{22}{5}ma^2\dot{\beta}^2 + \frac{2}{5}ma^2(\dot{\psi} - \dot{\phi}\sin\beta)^2\right]$$

and, selecting the datum at $\beta = 0$:

$$V = -2mga\sin\beta$$

$$T + V = \text{constant:}\quad \frac{1}{2}\left[\frac{22}{5}ma^2\dot{\phi}^2\cos^2\beta + \frac{22}{5}ma^2\dot{\beta}^2 + \frac{2}{5}ma^2(\dot{\psi} - \dot{\phi}\sin\beta)^2\right] - 2mga\sin\beta = \text{constant}$$

From the initial conditions $\dot{\phi} = \dot{\phi}_0,\ \dot{\psi} = \dot{\beta} = 0,\ \beta = 0,$ we find that the constant is $\frac{11}{5}ma^2\dot{\phi}_0^2$. Thus,

$$11\dot{\phi}^2\cos^2\beta + 11\dot{\beta}^2 + (\dot{\psi} - \dot{\phi}\sin\beta)^2 - 10\frac{g}{a}\sin\beta = 11\dot{\phi}_0^2 \tag{3}$$

Substituting for $\dot{\psi} - \dot{\phi}\sin\beta$ from Eq. (2) into Eqs. (1) and (3),

Eq. (1): $$11\dot{\phi}\cos^2\beta = 11\dot{\phi}_0 \tag{1′}$$

Eq. (3): $$11\dot{\phi}^2\cos^2\beta + 11\dot{\beta}^2 - 10\frac{g}{a}\sin\beta = 11\dot{\phi}_0^2 \tag{3′}$$

Solving (1′) for $\dot{\phi}$,

$$\dot{\phi} = \dot{\phi}_0\sec^2\beta \tag{4}$$

Substituting for $\dot{\phi}$ from Eq. (4) into Eq. (3′),

$$11(\dot{\phi}_0\sec^2\theta)^2\cos^2\beta + 11\dot{\beta}^2 - 10\frac{g}{a}\sin\beta = 11\dot{\phi}_0^2 \tag{5}$$

For the maximum value of β, we have $\dot{\beta} = 0$ and Eq. (5) yields

$$\dot{\phi}_0^2\left(\frac{1}{\cos^2\theta} - 1\right) = \frac{10}{11}\frac{g}{a}\sin\beta$$

$$\dot{\phi}_0^2 = \frac{10}{11}\frac{g}{a}\frac{\cos^2\beta}{\sin\beta} \tag{6}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 18.142* (Continued)

(*a*) Making $\beta = 30°$ in Eq. (6), we have

$$\dot{\phi}_0^2 = \frac{10}{11}\frac{g}{a}\frac{0.75}{0.5} = \frac{15}{11}\frac{g}{a} \qquad \dot{\phi}_0 = \sqrt{\frac{15}{11}\frac{g}{a}} \blacktriangleleft$$

(*b*) Substituting for $\dot{\phi}_0$ in Eq. (4), and making $\beta = 30°$:

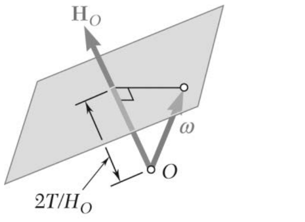
$$\dot{\phi} = \dot{\phi}_0 \sec^2 30° = \sqrt{\frac{15}{11}\frac{g}{a}}\left(\frac{4}{3}\right) = \sqrt{\frac{15(16)}{11(9)}\frac{g}{a}} \qquad \dot{\phi} = 2\sqrt{\frac{20}{33}\frac{g}{a}} \blacktriangleleft$$

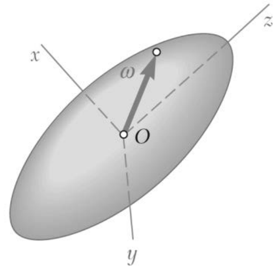
Substituting for in Eq. (2), and making $\beta = 30°$:

$$\dot{\psi} = \dot{\phi}\sin 30° = \frac{1}{2}\dot{\phi} \qquad \dot{\psi} = \sqrt{\frac{20}{33}\frac{g}{a}} \blacktriangleleft$$

If you are a student using this Manual, you are using it without permission.*

PROBLEM 18.143*





Consider a rigid body of arbitrary shape which is attached at its mass center O and subjected to no force other than its weight and the reaction of the support at O.

(a) Prove that the angular momentum $\mathbf{H}_O$ of the body about the fixed Point O is constant in magnitude and direction, that the kinetic energy T of the body is constant, and that the projection along $\mathbf{H}_O$ of the angular velocity $\boldsymbol{\omega}$ of the body is constant.

(b) Show that the tip of the vector $\boldsymbol{\omega}$ describes a curve on a fixed plane in space (called the *invariable plane*), which is perpendicular to $\mathbf{H}_O$ and at a distance $2T/H_O$ from O.

(c) Show that with respect to a frame of reference attached to the body and coinciding with its principal axes of inertia, the tip of the vector $\boldsymbol{\omega}$ appears to describe a curve on an ellipsoid of equation

$$I_x\omega_x^2 + I_y\omega_y^2 + I_z\omega_z^2 = 2T = \text{constant}$$

The ellipsoid (called the *Poinsot ellipsoid*) is rigidly attached to the body and is of the same shape as the ellipsoid of inertia, but of a different size.

SOLUTION

(a) From Equation (18.27), $\quad \Sigma\mathbf{M}_O = \dot{\mathbf{H}}_O$

Since $\quad \Sigma\mathbf{M}_O = 0, \quad \dot{\mathbf{H}}_O = 0. \qquad \mathbf{H}_O = \text{constant} \quad (1)$ ◀

Conservation of energy: $\quad T + V = \text{constant}$

Since $\quad V = 0, \qquad T = \text{constant} \quad (2)$ ◀

For a rigid body rotating about Point O,

$$T = \frac{1}{2}\left(I_x\omega_x^2 + I_y\omega_y^2 + I_z\omega_z^2\right)$$

$$\mathbf{H}_O = I_x\omega_x\mathbf{i} + I_y\omega_y\mathbf{j} + I_z\omega_z\mathbf{k}$$

$$\boldsymbol{\omega} = \omega_x\mathbf{i} + \omega_y\mathbf{j} + \omega_z\mathbf{k}$$

$$\mathbf{H}_O \cdot \omega = I_x\omega_x^2 + I_y\omega_y^2 + I_z\omega_z^2 = 2T$$

Let β be the angle between the vectors $\mathbf{H}_O$ and $\boldsymbol{\omega}$.

$$\mathbf{H}_O \cdot \boldsymbol{\omega} = H_O\omega\cos\beta$$

The projection of $\boldsymbol{\omega}$ along $\mathbf{H}_O$ is $\omega\cos\beta$

$$\omega\cos\beta = \frac{2T}{H_O} = \text{constant} \qquad \omega\cos\beta = \text{constant} \quad (3) ◀$$

PROBLEM 18.143* (Continued)

(*b*) $\omega \cos \beta$ is the perpendicular distance from the invariable plane. This distance is equal to $\frac{2T}{H_O}$.

(*c*) For a frame of reference attached to the body, the moments of inertia with respect of orthogonal axes of the frame do not change.

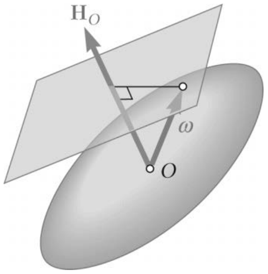
$$I_x \omega_x^2 + I_y \omega_y^2 + I_z \omega_z^2 = 2T \tag{4}$$

Let
$$a_1 = \sqrt{\frac{2T}{I_x}}, \quad b_1 = \sqrt{\frac{2T}{I_y}}, \quad c_1 = \sqrt{\frac{2T}{I_z}} \tag{5}$$

Then
$$\frac{\omega_x^2}{a_1^2} + \frac{\omega_y^2}{b_1^2} + \frac{\omega_z^2}{c_1^2} = 1 \tag{6}$$

which is the equation of an ellipsoid.

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. If you are a student using this Manual, you are using it without permission.*



PROBLEM 18.144*

Referring to Problem 18.143, (*a*) prove that the Poinsot ellipsoid is tangent to the invariable plane, (*b*) show that the motion of the rigid body must be such that the Poinsot ellipsoid appears to roll on the invariable plane. [*Hint:* In part *a,* show that the normal to the Poinsot ellipsoid at the tip of $\boldsymbol{\omega}$ is parallel to $\mathbf{H}_O$. It is recalled that the direction of the normal to a surface of equation $F(x, y, z) = \text{constant}$ at a Point *P* is the same as that of **grad** *F* at Point *P*.]

SOLUTION

(*a*) From Problem 18.143, the equation of the Poinsot ellipsoid is

$$I_x\omega_x^2 + I_y\omega_y^2 + I_z\omega_z^2 = 2T = \text{constant}$$

Let $$F(\omega_x, \omega_y, \omega_z) = I_x\omega_x^2 + I_y\omega_y^2 + I_z\omega_z^2$$

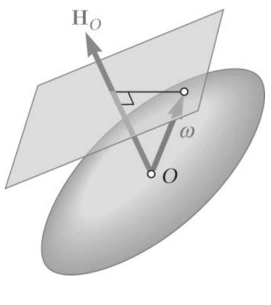
$$\textbf{grad } F = \frac{\partial F}{\partial \omega_x}\mathbf{i} + \frac{\partial F}{\partial \omega_y}\mathbf{j} + \frac{\partial F}{\partial \omega_z}\mathbf{k}$$

$$= 2I_x\omega_x\mathbf{i} + 2I_y\omega_y\mathbf{j} + 2I_z\omega_z\mathbf{k} = 2\mathbf{H}_O$$

The direction of the normal at a point on the surface of the ellipsoid is parallel to **grad** *F*, which in turn is parallel to $\mathbf{H}_O$. Since $\mathbf{H}_O$ is normal also to the invariable plane, it follows that the Poinsot ellipsoid is tangent to the invariable plane at the point common to the plane and the ellipsoid.

(*b*) The Poinsot elipsoid moves with the body. Thus, its angular velocity is $\boldsymbol{\omega}$, the angular velocity of the body. Since Point *O* is regarded as fixed, the angular velocity vector lies along the axis of rotation, or the locus of points of zero velocity. Thus, the velocity of the point of contact of the Poinsot ellipsoid with the invariable plane is zero. The Poinsot ellipsoid rolls without slipping on the invariable plane.

All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



PROBLEM 18.145*

Using the results obtained in Problems 18.143 and 18.144, show that for an axisymmetrical body attached at its mass center O and under no force other than its weight and the reaction at O, the Poinsot ellipsoid is an ellipsoid of revolution and the space and body cones are both circular and are tangent to each other. Further show that (*a*) the two cones are tangent externally, and the precession is direct, when $I < I'$, where I and I' denote, respectively, the axial and transverse moment of inertia of the body, (*b*) the space cone is inside the body cone, and the precession is retrograde, when $I > I'$.

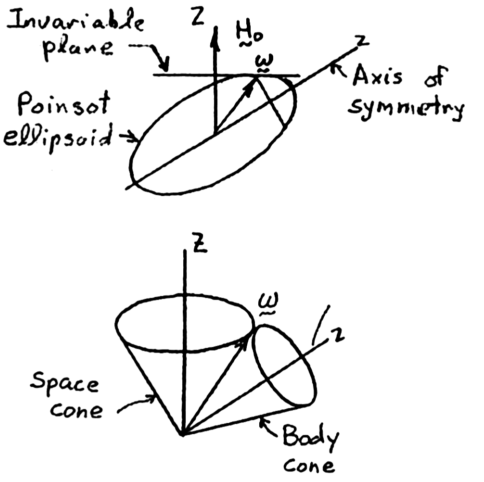
SOLUTION

Let $I_x = I_y = I'$ and $I_z = I$ so that the z axis is the symmetry axis. Then, the equation of the Poinsot ellipsoid (Equation (4) of Problem 18.143) becomes

$$I'\left(\omega_x^2 + \omega_y^2\right) + I\omega_z^2 = 2T = \text{constant}$$

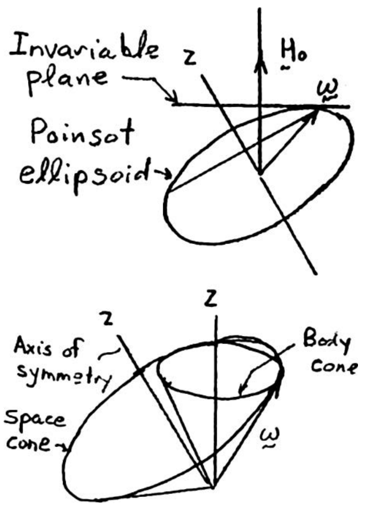
which is the equation of an *ellipsoid of revolution*. It follows that the tip of $\boldsymbol{\omega}$ describes circles on both the Poinsot ellipsoid and on the invariable plane, and that the vector $\boldsymbol{\omega}$ itself describes *circular body and space cones.* The Poinsot ellipsoid, the invariable plane, and the body and space cones are shown below for cases *a* and *b*.

(*a*) $I < I'$



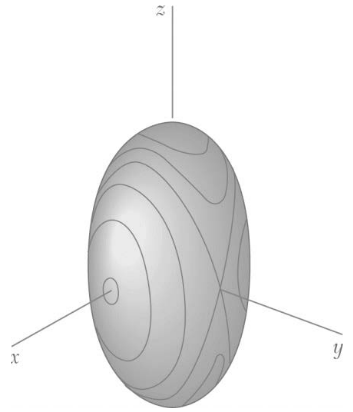
Direct Precession

(*b*) $I > I'$



Retrograde Precession

If you are a student using this Manual, you are using it without permission.*



PROBLEM 18.146*

Refer to Problems 18.143 and 18.144.

(*a*) Show that the curve (called *polhode*) described by the tip of the vector $\boldsymbol{\omega}$ with respect to a frame of reference coinciding with the principal axes of inertia of the rigid body is defined by the equations

$$I_x\omega_x^2 + I_y\omega_y^2 + I_z\omega_z^2 = 2T = \text{constant} \tag{1}$$

$$I_x^2\omega_x^2 + I_y^2\omega_y^2 + I_z^2\omega_z^2 = H_O^2 = \text{constant} \tag{2}$$

and that this curve can, therefore, be obtained by intersecting the Poinsot ellipsoid with the ellipsoid defined by Eq. (2).

(*b*) Further show, assuming $I_x > I_y > I_z$, that the polhodes obtained for various values of H_O have the shapes indicated in the figure.

(*c*) Using the result obtained in part *b*, show that a rigid body under no force can rotate about a fixed centroidal axis if, and only if, that axis coincides with one of the principal axes of inertia of the body, and that the motion will be stable if the axis of rotation coincides with the major or minor axis of the Poinsot ellipsoid (z or x axis in the figure) and unstable if it coincides with the intermediate axis (y axis).

SOLUTION

(*a*) Equation (1) expresses conservation of energy as shown in the solution to Problem 18.143. It is the equation of the Poinsot ellipsoid.

Let $$a_1 = \sqrt{\frac{2T}{I_x}}, \quad b_1 = \sqrt{\frac{2T}{I_y}}, \quad c_1 = \sqrt{\frac{2T}{I_z}}$$

Then $$\frac{\omega_x^2}{a_1^2} + \frac{\omega_y^2}{b_1^2} + \frac{\omega_z^2}{c_1^2} = 1 \tag{3}$$

which is the equation of an ellipsoid.

Equation (2) expresses the constancy of $H_O^2 = (H_O)_x^2 + (H_O)_y^2 + (H_O)_z^2$, the square of the magnitude of the angular momentum vector.

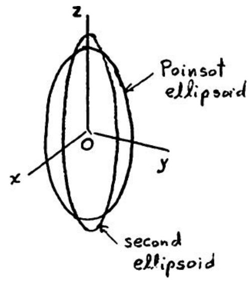
Let $$a_2 = \frac{H_O}{I_x}, \quad b_2 = \frac{H_O}{I_y}, \quad c_2 = \frac{H_O}{I_z}$$

Then $$\frac{\omega_x^2}{a_2^2} + \frac{\omega_y^2}{b_2^2} + \frac{\omega_z^2}{c_2^2} = 1 \tag{4}$$

which is the equation of a second ellipsoid.

Since the coordinates ω_x, ω_y, ω_z of the tip of the vector $\boldsymbol{\omega}$ must satisfy both Equations (1) and (2), the curve described by the tip of $\boldsymbol{\omega}$ is the intersection of the two ellipsoids.

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

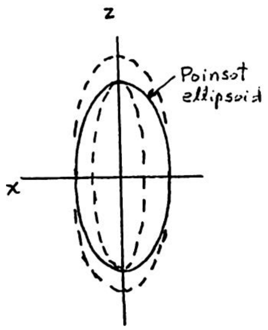


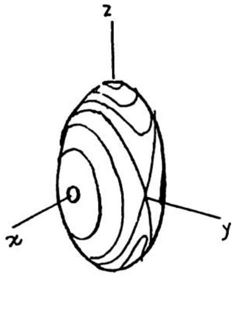
(*b*) Assume $I_x > I_y > I_z$.

Then $$a_1 < b_1 < c_1 \quad \text{and} \quad a_2 < b_2 < c_2.$$

Thus, for both ellipsoids, the minor axis is directed along the *x* axis, the intermediate axis along the *y* axis, and the major axis along the *z* axis. However, because the ratio of the major to minor semiaxis is $\sqrt{\frac{I_x}{I_z}}$ for the Poinsot ellipsoid and is $\frac{I_x}{I_z}$ for the second ellipsoid, the deviation from a spherical shape is more pronounced in the second ellipsoid.

The largest ellipsoid of the second type to be in contact with the Poinsot ellipsoid will lie outside that ellipsoid and touch it at its points of intersection with the *x* axis, and the smallest will lie inside the Poinsot ellipsoid and touch it at its points of intersection with the *z* axis (see left-hand sketch). All ellipsoids of the second type comprised between these two will intersect the Poinsot ellipsoid along the curves called polhodes, as shown in the right-hand figure.





Note that the ellipsoid of the second type, which has the same intermediate axis as the Poinsot ellipsoid, intersects that ellipsoid along two ellipses whose planes contain the *y* axis. These curves are not polhodes, since the tip of $\boldsymbol{\omega}$ will not describe them, but they separate the polhodes into four groups. Two groups loop around the minor axis (*x* axis) and the other two around the major axis (*z* axis).

(*c*) If the body is set to spin about one of the principal axes, the Poinsot ellipsoid will remain in contact with the invariable plane at the same point (on the *x*, *y*, or *z* axis); the rotation is steady. In any other case, the point of contact will be located on one of the polhodes, and the tip of $\boldsymbol{\omega}$ will start describing that polhode, while the Poinsot ellipsoid rolls on the invariable plane.

A rotation about the *minor* or the *major* axis (*x* or *z* axis) is *stable*. If that motion is disturbed, the tip of $\boldsymbol{\omega}$ will move to a very small polhode surrounding that axis and stay close to its original position.

On the other hand, a rotation about the *intermediate* axis (*y* axis) is *unstable*. If that motion is disturbed, the tip of $\boldsymbol{\omega}$ will move to one of the polhodes located near that axis and start describing it, departing completely from its original position and causing the body to tumble.

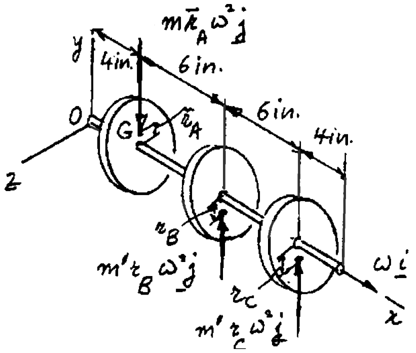
PROBLEM 18.147

Three 25-lb rotor disks are attached to a shaft which rotates at 720 rpm. Disk A is attached eccentrically so that its mass center is $\frac{1}{4}$in. from the axis of rotation, while disks B and C are attached so that their mass centers coincide with the axis of rotation. Where should 2-lb weights be bolted to disks B and C to balance the system dynamically?

SOLUTION

The system is dynamically balanced if the effective forces are equivalent to zero. Let Points A, B, and C be the points where the disks are attached to the shaft and let Point G be the mass center of disk A. Let m be the mass of each rotor and m' the magnitude of each added mass.



Since $\omega = \text{constant},$

$$\dot{H}_G = 0$$

for each disk. We treat the added masses as particles so that their moments of inertia about their mass centers are negligible. The effective force of disk A is.

$$(F_A)_{\text{eff}} = -m\bar{r}_A\omega^2\mathbf{j}$$

The effective forces of the added masses are

$$m' r_B \omega^2 \mathbf{j} \quad \text{and} \quad m' r_C \omega^2 \mathbf{j},$$

respectively for the masses added to disks B and C.

$$\Sigma F_{\text{eff}} = 0: \quad -m\bar{r}_A\omega^2\mathbf{j} + m' r_B\omega^2\mathbf{j} + m' r_C\omega^2\mathbf{j} = 0$$

$$r_B + r_C = \frac{m}{m'}\bar{r}_A \qquad (1)$$

$$\Sigma(M_0)_{\text{eff}} = 0 \quad 4\mathbf{i}\times(-m\bar{r}_A\omega^2\mathbf{j}) + 10\mathbf{i}\times(m' r_B\omega^2\mathbf{j}) + 16\mathbf{i}\times(m' r_C\omega^2\mathbf{j})$$

$$10r_B + 16r_2 = 4\frac{m}{m'}\bar{r}_A \qquad (2)$$

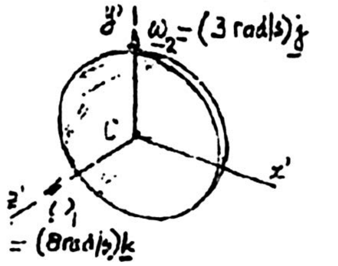
PROBLEM 18.148

A homogeneous disk of mass $m = 5$ kg rotates at the constant rate $\omega_1 = 8$ rad/s with respect to the bent axle *ABC*, which itself rotates at the constant rate $\omega_2 = 3$ rad/s about the *y* axis. Determine the angular momentum $\mathbf{H}_C$ of the disk about its center *C*.

SOLUTION

Using frame $Cx'y'z'$:



$$\bar{I}_{x'} = \bar{I}_{y'} = \frac{1}{4}mr^2$$

$$\bar{I}_{z'} = \frac{1}{2}mr^2$$

$$\mathbf{H}_C = \bar{I}_{y'}\omega_2\mathbf{j} + I_{z'}\omega_1\mathbf{k}$$

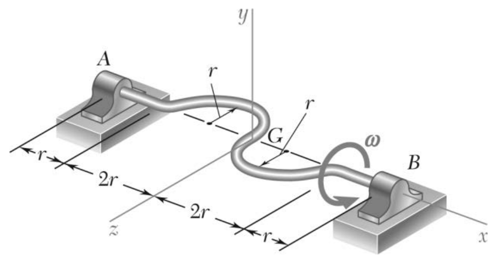
$$= \frac{1}{4}mr^2(\omega_2\mathbf{j} + 2\omega_1\mathbf{k})$$

$$\mathbf{H}_C = \frac{1}{4}(5 \text{ kg})(0.25 \text{ m})^2[(3 \text{ rad/s})\mathbf{j} + 2(8 \text{ rad/s})\mathbf{k}]$$

$$\mathbf{H}_C = (0.234 \text{ kg}\cdot\text{m}^2/\text{s})\mathbf{j} + (1.250 \text{ kg}\cdot\text{m}^2/\text{s})\mathbf{k} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 18.149



A rod of uniform cross section is used to form the shaft shown. Denoting by m the total mass of the shaft and knowing that the shaft rotates with a constant angular velocity **ω**, determine (*a*) the angular momentum $\mathbf{H}_G$ of the shaft about its mass center G, (*b*) the angle formed by $\mathbf{H}_G$ and the axis AB, (*c*) the angular momentum of the shaft about Point A.

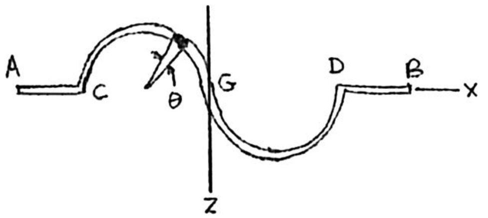
SOLUTION

Length of rod: $L = 2r + 2\pi r = 8.2832r$

Angular velocity: $\boldsymbol{\omega} = \omega\mathbf{i}$

Angular momentum: $\mathbf{H}_G = \bar{I}_x\omega\mathbf{i} - \bar{I}_{xz}\omega\mathbf{k}$

Calculation of $\bar{I}_x$ and $\bar{I}_{xz}$:



Let $\rho = \text{mass per unit length} = \dfrac{m}{L}$.

For portions AC and DB,

$$I_x = 0, \quad I_{xz} = 0$$

For portion CG, use polar coordinate θ.

$$x = -r(1-\cos\theta), \quad z = -r\sin\theta \quad dm = \rho r d\theta$$

$$I_x = \int z^2 dm = \int_0^\pi r^2 \sin^2\theta \rho r d\theta = \frac{\pi}{2}\rho r^3$$

$$I_{xz} = \int xz dm = \int_0^\pi r^2(1-\cos\theta)\sin\theta\rho r d\theta = 2\rho r^3$$

Likewise, for portion GD, $I_x = \dfrac{\pi}{2}\rho r^3, \quad I_{xz} = 2\rho r^3$

Total: $\bar{I}_x = \pi\rho r^3 = \dfrac{\pi m r^3}{L}, \quad \bar{I}_{xz} = 4\rho r^3 = \dfrac{4mr^3}{L}$

(*a*) Angular momentum $\mathbf{H}_G$. $\mathbf{H}_G = \dfrac{\pi m r^3}{L}\omega\mathbf{i} - \dfrac{4mr^3}{L}\omega\mathbf{k} = mr^2\omega(0.37927\mathbf{i} - 0.48291\mathbf{k})$

$$\mathbf{H}_G = mr^2\omega(0.379\mathbf{i} - 0.483\mathbf{k}) \blacktriangleleft$$

$$H_G = mr^2\omega(0.37927^2 + 0.48291^2)^{1/2} = 0.61404\, mr^2\omega$$

If you are a student using this Manual, you are using it without permission.*

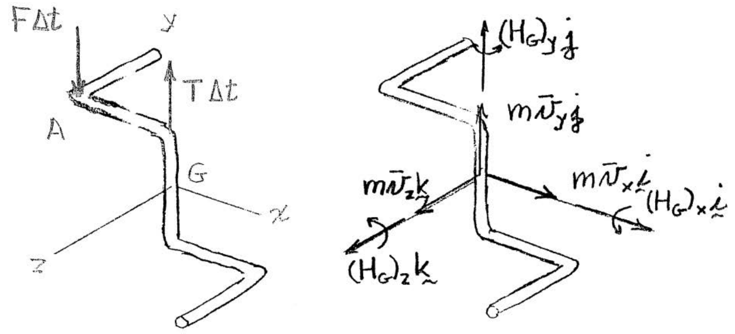
Constraint of the supporting cable: $\bar{v}_y = 0$

Impulse-momentum principle: Before impact, $\bar{\mathbf{v}} = 0$, $\mathbf{H}_G = 0$.



(*a*) Linear momentum: $\mathbf{F}(\Delta t) + T\Delta t\mathbf{j} = m\bar{\mathbf{v}}$ Resolve into components.

$$0 = m\bar{v}_x, \qquad -F\Delta t + T\Delta t\mathbf{j} = 0, \qquad 0 = m\bar{v}_z$$

$$\bar{v}_x = 0, \qquad T\Delta t = F\Delta t, \qquad \bar{v}_z = 0$$

$\bar{\mathbf{v}} = 0$ ◀

(*b*) Angular momentum, moments about *G*: $\mathbf{r}_{A/G} \times \mathbf{F}\Delta t = \mathbf{H}_G$

$$\left(\frac{a}{2}\mathbf{j} - a\mathbf{i}\right) \times [-(F\Delta t)\mathbf{j}] = (aF\Delta t)\mathbf{k} = (H_G)_x\mathbf{i} + (H_G)_y\mathbf{j} + (H_G)_z\mathbf{k}$$

Using expressions for $(H_G)_x$, $(H_G)_y$, and $(H_G)_z$ and resolving into components,

$$\mathbf{i}: \quad 0 = 0.35ma^2\omega_x + 0.3ma^2\omega_y - 0.2ma^2\omega_z$$

$$\mathbf{j}: \quad 0 = 0.3ma^2\omega_x + 0.66667ma^2\omega_y + 0.1ma^2\omega_z$$

$$\mathbf{k}: \quad aF\Delta t = -0.2ma^2\omega_x + 0.1ma^2\omega_y + 0.75ma^2\omega_z$$

Solving, $$\omega_x = 2.5\frac{(F\Delta t)}{ma}, \qquad \omega_y = -1.454\frac{(F\Delta t)}{ma}, \qquad \omega_z = 2.19\frac{(F\Delta t)}{ma}$$

$$\boldsymbol{\omega} = \left(\frac{F\Delta t}{ma}\right)(2.50\mathbf{i} - 1.454\mathbf{j} + 2.19\mathbf{k})$$ ◀

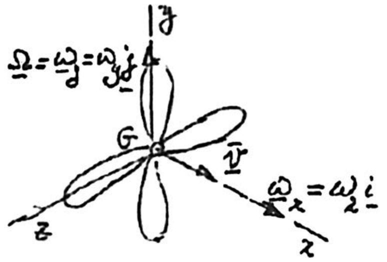
PROBLEM 18.151

A four-bladed airplane propeller has a mass of 160 kg and a radius of gyration of 800 mm. Knowing that the propeller rotates at 1600 rpm as the airplane is traveling in a circular path of 600-m radius at 540 km/h, determine the magnitude of the couple exerted by the propeller on its shaft due to the rotation of the airplane.

SOLUTION

We assume senses shown for $\boldsymbol{\omega}_x, \boldsymbol{\omega}_y$, and $\mathbf{v}$.



$$\bar{v} = 540 \text{ km/h} = 150 \text{ m/s}$$

$$\omega_x = 1600 \text{ rpm}\left(\frac{2\pi \text{ rad}}{60 \text{ s}}\right)$$
$$= 167.55 \text{ rad/s}$$

$$\omega_y = \frac{\bar{v}}{\rho} = \frac{150 \text{ m/s}}{600 \text{ m}} = 0.25 \text{ rad/s}$$

$$\bar{I}_x = m\bar{k}^2 = (160 \text{ kg})(0.8 \text{ m})^2 = 102.4 \text{ kg}\cdot\text{m}^2$$

Angular momentum about G:

$$\mathbf{H}_G = \bar{I}_x\omega_x\mathbf{i} + \bar{I}_y\omega_y\mathbf{j}$$

Eq. (18.22),

$$\dot{\mathbf{H}}_G = (\dot{\mathbf{H}}_G)_{Gxyz} + \boldsymbol{\Omega}\times\mathbf{H}_G = 0 + \omega_y\mathbf{j}\times(\bar{I}_x\omega_x\mathbf{i} + \bar{I}_y\omega_y\mathbf{j})$$

$$\dot{\mathbf{H}}_G = -\bar{I}_x\omega_x\omega_y\mathbf{k} = -(102.4 \text{ kg}\cdot\text{m}^2)(167.55 \text{ rad/s})(0.25 \text{ rad/s})\mathbf{k}$$

$$\dot{\mathbf{H}}_G = -(4289 \text{ N}\cdot\text{m})\mathbf{k} = -(4.29 \text{ kN}\cdot\text{m})\mathbf{k}$$

The couple exerted *on* the propeller, therefore, must be $\mathbf{M} = \dot{\mathbf{H}}_G = -(4.29 \text{ kN}\cdot\text{m})\mathbf{k}$, and the couple exerted *by* the propeller on its shaft is $-\mathbf{M} = (4.29 \text{ kN}\cdot\text{m})\mathbf{k}$.

Magnitude of couple. 4.29 kN · m ◀

PROBLEM 18.153

A homogeneous disk of weight $W = 6$ lb rotates at the constant rate $\omega_1 = 16$ rad/s with respect to arm ABC, which is welded to a shaft DCE rotating at the constant rate $\omega_2 = 8$ rad/s. Determine the dynamic reactions at D and E.

SOLUTION

Angular velocity of shaft DE and arm CBA: $\mathbf{\Omega} = \omega_2 \mathbf{i}$

Angular velocity of disk A: $\boldsymbol{\omega} = \omega_2 \mathbf{i} + \omega_1 \mathbf{j}$

Angular velocity about its mass center A:

$$\mathbf{H}_A = \bar{I}_x \omega_x \mathbf{i} + \bar{I}_y \omega_y \mathbf{j} + \bar{I}_z \omega_z \mathbf{k}$$

$$= \bar{I}_x \omega_2 \mathbf{i} + \bar{I}_y \omega_1 \mathbf{j}$$

$$= \frac{1}{4} m r^2 \omega_2 \mathbf{i} + \frac{1}{2} m r^2 \omega_1 \mathbf{j}$$

Let the reference frame $Oxyz$ be rotating with angular velocity $\mathbf{\Omega} = \omega_2 \mathbf{i}$.

$$\dot{\mathbf{H}}_A = (\dot{\mathbf{H}}_A)_{Oxyz} + \mathbf{\Omega} \times \mathbf{H}_A$$

$$= \frac{1}{4} m r^2 \dot{\omega}_2 \mathbf{i} + \frac{1}{2} m r^2 \dot{\omega}_1 \mathbf{j} + \omega_2 \mathbf{i} \times \mathbf{H}_A$$

$$= \frac{1}{4} m r^2 \dot{\omega}_2 \mathbf{i} + \frac{1}{2} m r^2 \dot{\omega}_1 \mathbf{j} + \frac{1}{2} m r^2 \omega_1 \omega_2 \mathbf{k}$$

Velocity of Point A:

$$\mathbf{v}_A = \omega_2 \mathbf{i} \times \mathbf{r}_{A/O}$$

$$= \omega_2 \mathbf{i} \times (-b\mathbf{k} + c\mathbf{j})$$

$$= b\omega_2 \mathbf{j} + c\omega_2 \mathbf{k}$$

Acceleration of Point A:

$$\mathbf{a}_A = \dot{\omega}_2 \mathbf{j} \times \mathbf{r}_{A/O} + \omega_2 \mathbf{j} \times \mathbf{v}_A$$

$$\mathbf{a}_A = (b\dot{\omega}_2 - c\omega_2^2)\mathbf{j} + (c\dot{\omega}_2 + b\omega_2)\mathbf{k}$$

Consider the system of particles consisting of the shaft, the arm, and the disk. Neglect the mass of the arm.

$$\Sigma \mathbf{F} = m\mathbf{a}_A$$

$$D_y \mathbf{j} + D_z \mathbf{k} + E_y \mathbf{j} + E_z \mathbf{k} = m\mathbf{a}_A$$

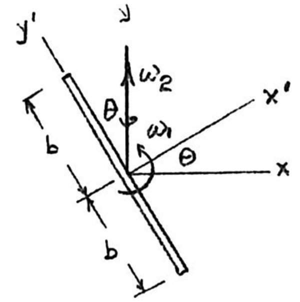
PROBLEM 18.154

A 48-kg advertising panel of length $2a = 2.4$ m and width $2b = 1.6$ m is kept rotating at a constant rate ω_1 about its horizontal axis by a small electric motor attached at A to frame ACB. This frame itself is kept rotating at a constant rate ω_2 about a vertical axis by a second motor attached at C to the column CD. Knowing that the panel and the frame complete a full revolution in 6 s and 12 s, respectively, express, as a function of the angle θ, the dynamic reaction exerted on column CD by its support at D.

SOLUTION

Use principal axes x', y', z' as shown.



Moments of inertia: $\quad \overline{I}_{x'} = \frac{1}{3}m(a^2 + b^2)$

$$\overline{I}_{y'} = \frac{1}{3}ma^2, \quad \overline{I}_{z'} = \frac{1}{3}mb^2$$

Kinematics: $\quad \dot{\theta} = \omega_1$

$$\omega_{x'} = \omega_2 \sin\theta, \quad \omega_{y'} = \omega_2 \cos\theta, \quad \omega_{z'} = \omega_1$$

$$\dot{\omega}_{x'} = \omega_1\omega_2 \cos\theta, \quad \dot{\omega}_{y'} = -\omega_1\omega_2 \sin\theta, \quad \dot{\omega}_{z'} = 0$$

Since the acceleration of the mass center is zero, the resultant force acting on the column CD is zero.

$\mathbf{R} = 0$ ◀

Euler's equations of motion for the plate:

$$\Sigma M_{x'} = \overline{I}_{x'}\dot{\omega}_{x'} - (\overline{I}_{y'} - \overline{I}_{z'})\omega_{y'}\omega_{z'}$$

$$= \overline{I}_{x'}\omega_1\omega_2 \cos\theta - (\overline{I}_{y'} - \overline{I}_{z'})\omega_1\omega_2 \cos\theta$$

$$= (\overline{I}_{x'} + \overline{I}_{z'} - \overline{I}_{y'})\omega_1\omega_2 \cos\theta = \frac{2}{3}mb^2\omega_1\omega_2 \cos\theta$$

$$\Sigma M_{y'} = \overline{I}_{y'}\dot{\omega}_{y'} - (\overline{I}_{z'} - \overline{I}_{x'})\omega_{x'}\omega_{z'}$$

$$= -\overline{I}_y\omega_1\omega_2 \sin\theta - (\overline{I}_z - \overline{I}_x)\omega_1\omega_2 \sin\theta$$

$$= (\overline{I}_{x'} - \overline{I}_{y'} - \overline{I}_{z'})\omega_1\omega_2 \sin\theta = 0$$

$$\Sigma M_{z'} = I_{z'}\dot{\omega}_{z'} - (\overline{I}_{x'} - \overline{I}_y)\omega_{x'}\omega_{y'}$$

$$= 0 - (\overline{I}_{x'} - \overline{I}_y)\omega_2^2 \sin\theta\cos\theta$$

$$= -\frac{1}{3}mb^2\omega_2^2 \sin\theta\cos\theta$$

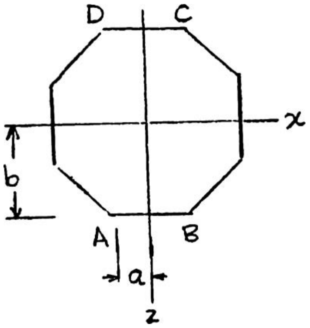
PROBLEM 18.155

A 2500-kg satellite is 2.4 m high and has octagonal bases of sides 1.2 m. The coordinate axes shown are the principal centroidal axes of inertia of the satellite, and its radii of gyration are $k_x = k_z = 0.90$ m and $k_y = 0.98$ m. The satellite is equipped with a main 500-N thruster E and four 20-N thrusters A, B, C, and D, which can expel fuel in the positive y direction. The satellite is spinning at the rate of 36 rev/h about its axis of symmetry G_y, which maintains a fixed direction in space, when thrusters A and B are activated for 2 s. Determine (a) the precession axis of the satellite, (b) its rate of precession, (c) its rate of spin.

SOLUTION

$$\omega_0 = (36 \text{ rev/h})\left(\frac{2\pi \text{ rad}}{\text{rev}}\right)\left(\frac{1 \text{ h}}{3600 \text{ s}}\right)$$
$$= 0.062832 \text{ rad/s}$$
$$m = 2500 \text{ kg}$$
$$I_x = mk_x^2 = (2500)(0.90)^2 = 2025 \text{ kg}\cdot\text{m}^2$$
$$I_z = I_x = 2025 \text{ kg}\cdot\text{m}^2$$
$$I_y = mk_y^2 = (2500)(0.98)^2 = 2401 \text{ kg}\cdot\text{m}^2$$
$$(\mathbf{H}_G)_0 = I_y\omega_0\mathbf{j} = (2401)(0.062832)\mathbf{j} = (150.86 \text{ kg}\cdot\text{m}^2/\text{s})\mathbf{j}$$
$$a = 0.6 \text{ m}, \quad b = 0.6 + 1.2 \cos 45° = 1.4485$$

When thrusters A and B are activated,



$$\mathbf{M}_G = -b(F_A + F_B)\mathbf{i}$$
$$= -(1.4485)(40)\mathbf{i}$$
$$= -(57.941 \text{ N}\cdot\text{m})\mathbf{i}$$

Angular momentum after 2 s:

$$\mathbf{H}_G = (\mathbf{H}_G)_0 + \mathbf{M}_G(\Delta t)$$
$$= 150.86\mathbf{j} + (-57.941)(2)\mathbf{i}$$
$$= -(115.88 \text{ kg}\cdot\text{m}^2/\text{s})\mathbf{i} + (150.86 \text{ kg}\cdot\text{m}^2/\text{s})\mathbf{j}$$
$$\omega_x = \frac{H_x}{I_x} = -\frac{115.88}{2025} = -0.057225 \text{ rad/s} = -32.788 \text{ rev/h}$$
$$\omega_y = \frac{H_y}{I_y} = 36 \text{ rev/h}$$
$$\omega_z = \frac{H_z}{I_z} = 0$$

PROBLEM 18.156

A thin disk of weight $W = 8$ lb rotates with an angular velocity ω_2 with respect to arm OA, which itself rotates with an angular velocity ω_1 about the y axis. Determine (*a*) the couple $M_1\mathbf{j}$ which should be applied to arm OA to give it an angular acceleration $\boldsymbol{\alpha}_1 = (6 \text{ rad/s}^2)\mathbf{j}$ with $\omega_1 = 4$ rad/s, knowing that the disk rotates at the constant rate $\omega_2 = 12$ rad/s, (*b*) the force-couple system representing the dynamic reaction at O at that instant. Assume that arm OA has a negligible mass.

SOLUTION

Angular velocity of arm OA: $\boldsymbol{\Omega} = \omega_1\mathbf{j}$

Angular velocity of disk A: $\boldsymbol{\omega} = \omega_1\mathbf{j} + \omega_2\mathbf{k}$

Angular momentum about its mass center A:

$$\begin{aligned}\mathbf{H}_A &= \bar{I}_x\omega_x\mathbf{i} + \bar{I}_y\omega_y\mathbf{j} + \bar{I}_z\omega_z\mathbf{k}\\ &= \bar{I}_y\omega_1\mathbf{j} + \bar{I}_z\omega_2\mathbf{k}\\ &= \frac{1}{4}mr^2\omega_1\mathbf{j} + \frac{1}{2}mr^2\omega_2\mathbf{k}\end{aligned}$$

Let the reference $Oxyz$ be rotating with angular velocity $\boldsymbol{\Omega} = \omega_2\mathbf{j}$.

$$\begin{aligned}\dot{\mathbf{H}}_A &= (\dot{\mathbf{H}}_A)_{Oxyz} + \boldsymbol{\Omega}\times\mathbf{H}_A\\ &= \frac{1}{4}mr^2\dot{\omega}_1\mathbf{j} + \frac{1}{2}mr^2\dot{\omega}_2\mathbf{k} + \omega_1\mathbf{j}\times\mathbf{H}_A\\ &= \frac{1}{2}mr^2\omega_1\omega_2\mathbf{i} + \frac{1}{4}mr^2\dot{\omega}_1\mathbf{j} + \frac{1}{2}mr^2\dot{\omega}_2\mathbf{k}\end{aligned}$$

Velocity of Point A:

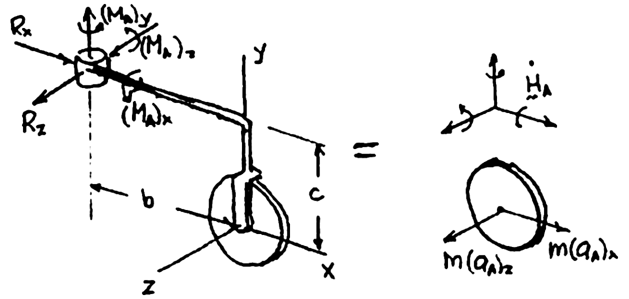
$$\begin{aligned}\mathbf{v}_A &= \omega_1\mathbf{j}\times\mathbf{r}_{A/O}\\ &= \omega_1\mathbf{j}\times(b\mathbf{i} - c\mathbf{j})\\ &= -b\omega_1\mathbf{k}\end{aligned}$$

Acceleration of Point A:

$$\begin{aligned}\mathbf{a}_A &= \dot{\omega}_1\mathbf{j}\times\mathbf{r}_{A/O} + \omega_1\mathbf{j}\times\mathbf{v}_A\\ &= -b\omega_1^2\mathbf{i} - b\dot{\omega}_1\mathbf{k}\end{aligned}$$

If you are a student using this Manual, you are using it without permission.*

Consider the system of particles consisting of the arm OA and disk A. Neglect the mass of the arm.



$$\Sigma \mathbf{F} = m\mathbf{a}_A:$$

$$R_x\mathbf{i} + R_z\mathbf{k} = -mb\omega_1^2\mathbf{i} - mb\dot{\omega}_1\mathbf{k}$$

$$R_x = -mb\omega_1^2$$

$$R_z = -mb\dot{\omega}_1$$

$$\Sigma \mathbf{M}_O = \dot{\mathbf{H}}_O = \dot{\mathbf{H}}_A + \mathbf{r}_{A/O} \times m\mathbf{a}_A$$

$$(M_O)_x\mathbf{i} + (M_O)_y\mathbf{j} + (M_O)_z\mathbf{k} = m\left(\frac{1}{2}r^2\omega_1\omega_2 + bc\dot{\omega}_1\right)\mathbf{i}$$

$$+m\left(\frac{1}{4}r^2 + b^2\right)\dot{\omega}_1\mathbf{j} + m\left(\frac{1}{2}r^2\dot{\omega}_2 - bc\omega_1^2\right)\mathbf{k}$$

Data:

$$W = 8 \text{ lb}$$

$$m = \frac{8}{32.2} = 0.24845 \text{ lb}\cdot\text{s}^2/\text{ft}$$

$$r = 5 \text{ in.} = 0.41667 \text{ ft}$$

$$b = 16 \text{ in.} = 1.33333 \text{ ft}$$

$$c = 10 \text{ in.} = 0.83333 \text{ ft}$$

$$\omega_1 = 4 \text{ rad/s}$$

$$\dot{\omega}_1 = 6 \text{ rad/s}^2$$

$$\omega_2 = 12 \text{ rad/s}$$

$$\dot{\omega}_2 = 0$$

(*a*) Required couple: The required couple is the y-component of the couple at Point O.

$$(\mathbf{M}_O)_y = (0.24845)\left[\frac{1}{4}(0.41667)^2 + (1.33333)^2\right](6)\mathbf{j} \qquad (\mathbf{M}_O)_y = (2.71 \text{ lb}\cdot\text{ft})\mathbf{j} \blacktriangleleft$$

PROBLEM 18.156 (Continued)

(*b*) Dynamic reaction at Point *O*.

$$R_x = -(0.24845)(1.33333)(4)^2 = -5.30 \text{ lb}, \qquad R_y = 0$$

$$R_z = -(0.24845)(1.33333)(6) = -1.988 \text{ lb}$$

$$\mathbf{R} = -(5.30 \text{ lb})\mathbf{i} - (1.988 \text{ lb})\mathbf{k} \blacktriangleleft$$

$$(M_O)_x = (0.24845)\left[\left(\frac{1}{2}\right)(0.41667)^2(4)(12) + (1.33333)(0.83333)(6)\right]$$

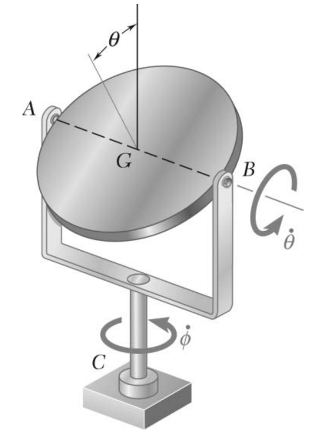
$$= 2.69 \text{ lb}\cdot\text{ft}$$

$$(M_O)_z = (0.24845)[0 - (1.33333)(0.83333)(4)^2]$$

$$= -4.42 \text{ lb}\cdot\text{ft}$$

$$\mathbf{M}_O = (2.69 \text{ lb}\cdot\text{ft})\mathbf{i} - (4.42 \text{ lb}\cdot\text{ft})\mathbf{k} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

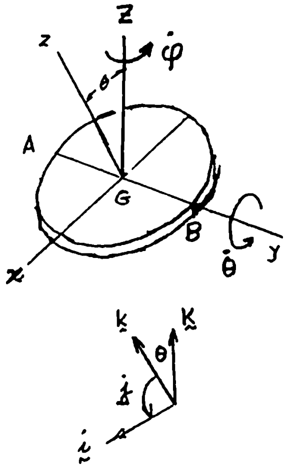


PROBLEM 18.157

A homogeneous disk of mass m connected at A and B to a fork-ended shaft of negligible mass which is supported by a bearing at C. The disk is free to rotate about its horizontal diameter AB and the shaft is free to rotate about a vertical axis through C. Initially, the disk lies in a vertical plane $(\theta_0 = 90°)$ and the shaft has an angular velocity $\dot{\phi}_0 = 8$ rad/s. If the disk is slightly disturbed, determine for the ensuring motion (*a*) the minimum value of $\dot{\phi}$, (*b*) the maximum value of $\dot{\theta}$.

SOLUTION

Place the origin at the center of mass and let *Oxyz* be a principal axis frame of reference with the *y* axis directed along the moving axle *AB*. Let the *Z* axis lie along the fixed axle. Useful unit vectors are **i**, **j** and **k** along the *x*, *y*, *z* axes and **K** along the *Z* axis.



$$\mathbf{K} = -\mathbf{i}\sin\theta + \mathbf{k}\cos\theta$$

Angular velocity:

$$\boldsymbol{\omega} = \dot{\varphi}\mathbf{k} + \dot{\theta}\mathbf{j}$$

$$\boldsymbol{\omega} = -\dot{\varphi}\sin\theta\mathbf{i} + \dot{\theta}\mathbf{j} + \dot{\varphi}\cos\theta\mathbf{k}$$

Moments of inertia:

$$I_x = e_1 I_y, \qquad I_z = e_2 I_y$$

<u>Angular momentum about *O*</u>.

$$\mathbf{H}_O = I_x\omega_x\mathbf{i} + I_y\omega_y\mathbf{j} + I_z\omega_z\mathbf{k}$$

$$= I_y(-e_1\dot{\varphi}\sin\theta\,\mathbf{i} + \dot{\theta}\,\mathbf{j} + e_2\dot{\varphi}\cos\theta\,\mathbf{k})$$

The moment about the fixed *Z* axis is zero, hence, $\mathbf{H}_O \cdot \mathbf{K} = \text{constant}$.

$$\mathbf{H}_O \cdot \mathbf{K} = I_y(e_1\sin^2\theta + e_2\cos^2\theta)\dot{\varphi} = I_y C_1$$

$$\dot{\varphi} = \frac{C_1}{e_1\sin^2\theta + e_2\cos^2\theta}$$

$$C_1 = (e_1\sin^2\theta_0 + e_2\cos^2\theta_0)\dot{\varphi}_0$$

Twice the kinetic energy:

$$2T = I_x\omega_x^2 + I_y\omega_y^2 + I_z\omega_z^2 = \text{constant}$$

$$2T = I_y[(e_1\sin^2\theta + e_2\cos^2\theta)\dot{\varphi}^2 + \dot{\theta}^2]$$

$$= I_y(C_1\dot{\varphi} + \dot{\theta}^2)$$

$$= I_y C_2$$

$$\dot{\theta}^2 = C_2 - C_1\dot{\varphi}$$

$$C_2 = \dot{\theta}_0^2 + C_1\dot{\varphi}_0$$

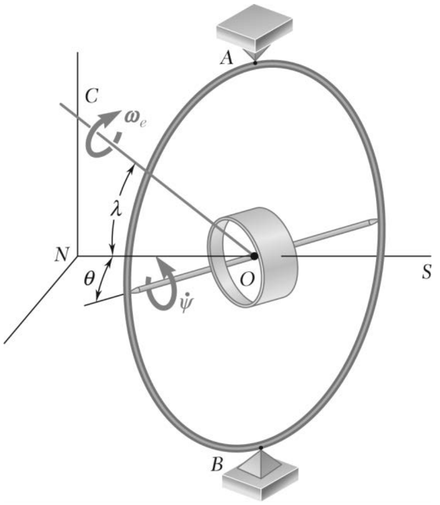
PROBLEM 18.158



The essential features of the gyrocompass are shown. The rotor spins at the rate $\dot{\psi}$ about an axis mounted in a single gimbal, which may rotate freely about the vertical axis *AB*. The angle formed by the axis of the rotor and the plane of the meridian is denoted by θ, and the latitude of the position on the earth is denoted by λ. We note that line *OC* is parallel to the axis of the earth, and we denote by $\boldsymbol{\omega}_e$ the angular velocity of the earth about its axis.

(*a*) Show that the equations of motion of the gyrocompass are

$$I'\ddot{\theta} + I\omega_z\omega_e\cos\lambda\sin\theta - I'\omega_e^2\cos^2\lambda\sin\theta\cos\theta = 0$$

$$I\dot{\omega}_z = 0$$

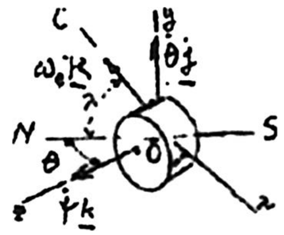
where ω_z is the rectangular component of the total angular velocity $\boldsymbol{\omega}$ along the axis of the rotor, and I and I' are the moments of inertia of the rotor with respect to its axis of symmetry and a transverse axis through O, respectively.

(*b*) Neglecting the term containing ω_e^2, show that for small values of θ, we have

$$\ddot{\theta} + \frac{I\omega_z\omega_e\cos\lambda}{I'}\theta = 0$$

and that the axis of the gyrocompass oscillates about the north-south direction.

SOLUTION



(*a*) <u>Angular momentum about *O*.</u>

We select a frame of reference *Oxyz* attached to the gimbal. The angular velocity of *Oxyz* with respect to a Newtonian frame is $\boldsymbol{\Omega} = \omega_e\mathbf{K} + \dot{\theta}\mathbf{j}$

where $\quad \mathbf{K} = -\cos\lambda\sin\theta\mathbf{i} + \sin\lambda\mathbf{j} + \cos\lambda\cos\theta\mathbf{k}$

Thus, $\quad \boldsymbol{\Omega} = -\omega_e\cos\lambda\sin\theta\mathbf{i} + (\dot{\theta} + \omega_e\sin\lambda)\mathbf{j} + \omega_e\cos\lambda\cos\theta\mathbf{k} \qquad (1)$

The angular velocity $\boldsymbol{\omega}$ of the rotor is obtained by adding its spin $\dot{\psi}\mathbf{k}$ to $\boldsymbol{\Omega}$. Setting

$$\dot{\psi} + \omega_e\cos\lambda\cos\theta = \omega_z.$$

We have $\quad \boldsymbol{\omega} = -\omega_e\cos\lambda\sin\theta\mathbf{i} + (\dot{\theta} + \omega_e\sin\lambda)\mathbf{j} + \omega_z\mathbf{k} \qquad (2)$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

The angular momentum $\mathbf{H}_O$ of the rotor is

$$\mathbf{H}_O = I_x\omega_z\mathbf{i} + I_y\omega_y\mathbf{j} + I_z\omega_z\mathbf{k}$$

where $I_x = I_y = I'$ and $I_z = I$. Recalling Eq. (2), we write

$$\mathbf{H}_O = -I'\omega_e\cos\lambda\sin\theta\mathbf{i} + I'(\dot{\theta} + \omega_e\sin\lambda)\mathbf{j} + I\omega_z\mathbf{k} \qquad (3)$$

<u>Equations of motion</u>.

Eq. (18.28): $\Sigma\mathbf{M}_O = (\dot{\mathbf{H}}_O)_{Oxyz} + \mathbf{\Omega}\times\mathbf{H}_O$ or, from Eqs. (1) and (3):

$$\Sigma\mathbf{M}_O = -I'\omega_e\cos\lambda\cos\theta\dot{\theta}\mathbf{i} + I'\ddot{\theta}\mathbf{j} + I\dot{\omega}_z\mathbf{k} + \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -\omega_e\cos\lambda\sin\theta & \dot{\theta} + \omega_e\sin\lambda & \omega_e\cos\lambda\cos\theta \\ -I'\omega_e\cos\lambda\sin\theta & I'(\dot{\theta} + \omega_e\sin\lambda) & I\omega_z \end{vmatrix} \qquad (4)$$

We observe that the rotor is free to spin about the *z* axis and free to rotate about the *y* axis. Therefore, the *y* and *z* components of $\Sigma\mathbf{M}_O$ must be zero. It follows that the coefficients of **j** and **k** at the right-hand member of Eq. (4) must also be zero.

Setting the coefficient of **j** in the right-hand member of Eq. (4) equal to zero,

$$I'\ddot{\theta} + (-I'\omega_e\cos\lambda\sin\theta)(\omega_e\cos\lambda\cos\theta) - (-\omega_e\cos\lambda\sin\theta)I\omega_z = 0$$

$$I'\ddot{\theta} + I\omega_z\omega_e\cos\lambda\sin\theta - I'\omega_e^2\cos^2\lambda\sin\theta\cos\theta = 0 \qquad (5) ◀$$

Q. E. D

Setting the coefficient of **k** equal to zero,

$$I\dot{\omega}_z + (-\omega_e\cos\lambda\sin\theta)I'(\theta + \omega_e\sin\lambda) - (-I'\omega_e\cos\lambda\sin\theta)(\dot{\theta} + \omega_e\sin\lambda) = 0$$

Observing that the last two terms cancel out, we have

$$I\dot{\omega}_z = 0 \qquad \text{Q. E. D.} \qquad (6) ◀$$

(*b*) It follows from Eq. (6) that $\omega_z = \text{constant}$ (7)

Rewrite Eq. (5) as follows: $I'\ddot{\theta} + (I\omega_z - I'\omega_e\cos\lambda\cos\theta)\omega_e\cos\lambda\sin\theta = 0$

It is evident that $\omega_z >>> \omega_e$. We can therefore neglect the second term in the parenthesis and write

$$I'\ddot{\theta} + I\omega_z\omega_e\cos\lambda\sin\theta = 0$$

or

$$\ddot{\theta} + \frac{I\omega_z\omega_e\cos\lambda}{I'}\sin\theta = 0 \qquad (8)$$

If you are a student using this Manual, you are using it without permission.*

PROBLEM 18.158 (Continued)

where the coefficient of sin θ is a constant. The rotor, therefore, oscillates about the line *NS* as a simple pendulum. For small oscillations, $\sin\theta \approx \theta,$ and Eq. (8) yields

$$\ddot{\theta} + \frac{I\omega_z\omega_e \cos\lambda}{I'}\theta = 0 \qquad \text{Q. E. D.} \qquad (9) ◀$$

Eq. (9) is the equation of simple harmonic motion with period

$$\tau = 2\pi\sqrt{\frac{I'}{I\omega_z\omega_e \cos\lambda}} \qquad (10)$$

Since its rotor oscillates about the line *NS*, the gyrocompass can be used to determine the direction of that line. We should note, however, that for values of λ close to 90° or –90°, the period of oscillation becomes very large and the line about which the rotor oscillates cannot be determined. The gyrocompass, therefore, cannot be used in the polar regions.

CHAPTER 19

PROBLEM 19.1

Determine the maximum velocity and maximum acceleration of a particle which moves in simple harmonic motion with an amplitude of 3 mm and a frequency of 20 Hz.

SOLUTION

Frequency: $f = 20\text{ Hz}$

$$\omega_n = 2\pi f = (2\pi)(20) = 125.66\text{ rad/s}$$

Amplitude: $x_m = 3\text{ mm}$

Simple harmonic motion: $x = x_m \sin(\omega_n t + \phi)$

$$v = \dot{x} = \omega_n x_m \cos(\omega_n t + \phi)$$

$$a = \dot{v} = \ddot{x} = -\omega_n^2 x_m \sin(\omega_n t + \phi)$$

Maximum velocity: $v_m = \omega_n x_m = (125.66\text{ rad/s})(3\text{ mm})$

$$= 377\text{ mm/s}$$

$$v_m = 0.377\text{ m/s} \blacktriangleleft$$

Maximum acceleration: $a_m = \omega_n^2 x_m = (125.66\text{ rad/s})^2(3\text{ mm})$

$$= 47.3 \times 10^3\text{ mm/s}^2$$

$$a_m = 47.3\text{ m/s}^2 \blacktriangleleft$$

PROBLEM 19.2

A particle moves in simple harmonic motion. Knowing that the amplitude is 15 in. and the maximum acceleration is 15 ft/s^2, determine the maximum velocity of the particle and the frequency of its motion.

SOLUTION

Simple harmonic motion.

$$x = x_m \sin(\omega_n t + \phi)$$

$$x_m = 15 \text{ in.} = 1.25 \text{ ft}$$

$$\dot{x} = v = x_m \omega_n \cos(\omega_n t + \phi)$$

$$\ddot{x} = a = -x_m \omega_n^2 \sin(\omega_n t + \phi)$$

$$a_m = -x_m \omega_n^2$$

$$|a_m| = 15 \text{ ft/s}^2 = (1.25 \text{ ft})\omega_n^2$$

Natural frequency

$$\omega_n = 3.4641 \text{ rad/s}$$

$$f_n = \frac{\omega_n}{2\pi} = 0.55133 \text{ Hz}$$

$$f_n = 0.551 \text{ Hz} \blacktriangleleft$$

Maximum velocity

$$v_m = x_m \omega_n = (1.25 \text{ ft})(3.4641 \text{ rad/s})$$

$$= 4.3301 \text{ ft/s}$$

$$v_m = 4.33 \text{ ft/s} \blacktriangleleft$$

PROBLEM 19.3

Determine the amplitude and maximum velocity of a particle which moves in simple harmonic motion with a maximum acceleration of 15 ft/s^2 and a frequency of 8 Hz.

SOLUTION

Simple harmonic motion $\quad x = x_m \sin(\omega_n t + \phi)$

$$\omega_n = 2\pi f_n = 2\pi(8\text{ Hz}) = 16\pi \text{ rad/s}$$

$$\dot{x} = v = x_m \omega_n \cos(\omega_n t + \phi)$$

$$v_m = x_m \omega_n$$

$$\ddot{x} = a = -x_m \omega_n^2 \sin(\omega_n t + \phi)$$

$$a_m = x_m \omega_n^2$$

$$15 \text{ ft/s}^2 = x_m (16\pi \text{ rad/s})^2$$

Maximum displacement. $\quad x_m = 0.005937 \text{ ft} = 0.0712 \text{ in.}$

$$x_m = 0.0712 \text{ in.} \blacktriangleleft$$

Maximum velocity. $\quad v_m = x_m \omega_n = (0.005937 \text{ ft})(16\pi \text{ rad/s})$

$$= 0.2984 \text{ ft/s} = 3.58 \text{ in./s}$$

$$v_m = 3.58 \text{ in./s} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 19.4

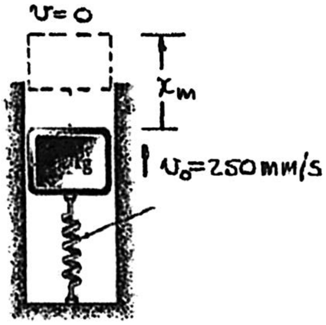
A 32-kg block is attached to a spring and can move without friction in a slot as shown. The block is in its equilibrium position when it is struck by a hammer, which imparts to the block an initial velocity of 250 mm/s. Determine (*a*) the period and frequency of the resulting motion, (*b*) the amplitude of the motion and the maximum acceleration of the block.

SOLUTION



(*a*)

$$x = x_m \sin(\omega_n t + \phi)$$

$$\omega_n = \sqrt{\frac{k}{m}} = \sqrt{\frac{12\times 10^3 \text{ N/m}}{32 \text{ kg}}}$$

$$\omega_n = 19.365 \text{ rad/s}$$

$$\tau_n = \frac{2\pi}{\omega_n}$$

$$\tau_n = \frac{2\pi}{19.365} \qquad \tau_n = 0.324 \text{ s} \blacktriangleleft$$

$$f_n = \frac{1}{\tau_n} = \frac{1}{0.324} = 3.08 \text{ Hz} \blacktriangleleft$$

(*b*) At $t = 0$, $x_0 = 0$, $\dot{x}_0 = v_0 = 250$ mm/s

Thus, $x_0 = 0 = x_m \sin(\omega_n(0) + \phi)$

and $\phi = 0$

$$\dot{x}_0 = v_0 = x_m\omega_n \cos(\omega_n(0) + 0) = x_m\omega_n$$

$$v_0 = 0.250 \text{ m/s} = x_m(19.365 \text{ rad/s})$$

$$x_m = \frac{(0.250 \text{ m/s})}{(19.365 \text{ rad/s})}$$

$$x_m = 12.91\times 10^{-3} \text{ m} \qquad x_m = 12.91 \text{ mm} \blacktriangleleft$$

$$a_m = x_m\omega_n^2 = (12.91\times 10^{-3} \text{ m})(19.365 \text{ rad/s})^2 \qquad a_m = 4.84 \text{ m/s}^2 \blacktriangleleft$$

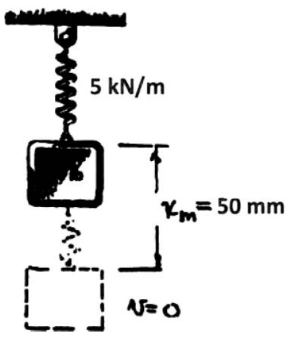
PROBLEM 19.5

A 12-kg block is supported by the spring shown. If the block is moved vertically downward from its equilibrium position and released, determine (*a*) the period and frequency of the resulting motion, (*b*) the maximum velocity and acceleration of the block if the amplitude of its motion is 50 mm.

SOLUTION



(*a*) Simple harmonic motion. $x = x_m \sin(\omega_n t + \phi)$

Natural frequency. $\omega_n = \sqrt{\dfrac{k}{m}}$ $\quad k = 5 \text{ kN/m} = 5000 \text{ N/m}$

$$\omega_n = \sqrt{\frac{(5000 \text{ N/m})}{12 \text{ kg}}}$$

$$\omega_n = 20.412 \text{ rad/s}$$

$$\tau_n = \frac{2\pi}{\omega_n}$$

$$\tau_n = \frac{2\pi}{20.412} = 0.30781 \text{ s}$$

$\tau_n = 0.308 \text{ s}$ ◀

$f_n = \dfrac{1}{\tau_n} = \dfrac{1}{0.30781} = 3.25 \text{ Hz}$ ◀

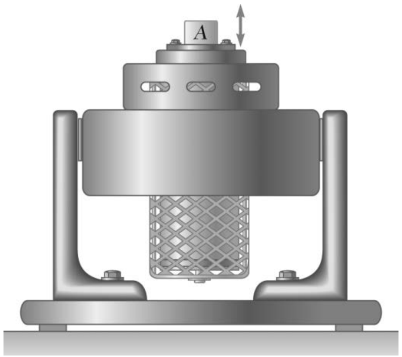
(*b*) $x_m = 50 \text{ mm} = 0.05 \text{ m}$

$$x = 0.05 \sin(20.412t + \phi)$$

Maximum velocity. $v_m = x_m \omega_n = (0.05 \text{ m})(20.412 \text{ rad/s})$ $\quad v_m = 1.021 \text{ m/s}$ ◀

Maximum acceleration. $a_m = x_m \omega_n^2 = (0.05 \text{ m})(20.412 \text{ rad/s})^2$ $\quad a_m = 20.8 \text{ m/s}^2$ ◀

All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



PROBLEM 19.6

An instrument package A is bolted to a shaker table as shown. The table moves vertically in simple harmonic motion at the same frequency as the variable-speed motor which drives it. The package is to be tested at a peak acceleration of 150 ft/s². Knowing that the amplitude of the shaker table is 2.3 in., determine (*a*) the required speed of the motor in rpm, (*b*) the maximum velocity of the table.

SOLUTION

In simple harmonic motion,

$$a_{max} = x_{max}\omega_n^2$$

$$150 \text{ ft/s}^2 = \left(\frac{2.3}{12}\text{ ft}\right)\omega_n^2$$

$$\omega_n^2 = (782.6 \text{ rad/s})^2$$

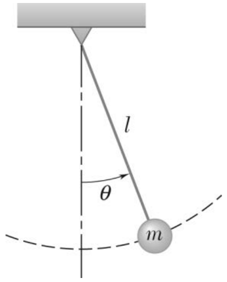
$$\omega_n = 27.98 \text{ rad/s}$$

$$f_n = \frac{\omega_n}{2\pi} = \frac{27.98}{2\pi} = 4.452 \text{ Hz (cycles per second)}$$

(*a*) Motor speed. $(4.452 \text{ rev/s})(60 \text{ s/min})$ speed = 267 rpm ◀

(*b*) Maximum velocity. $v_{max} = x_{max}\omega_n = \left(\frac{2.3}{12}\text{ ft}\right)(27.98 \text{ rad/s})$ $v_{max} = 5.36 \text{ ft/s}$ ◀

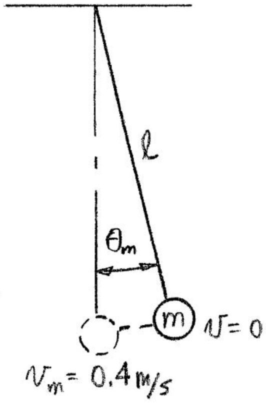
PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



PROBLEM 19.7

A simple pendulum consisting of a bob attached to a cord oscillates in a vertical plane with a period of 1.3 s. Assuming simple harmonic motion and knowing that the maximum velocity of the bob is 0.4 m/s, determine (*a*) the amplitude of the motion in degrees, (*b*) the maximum tangential acceleration of the bob.

SOLUTION



(*a*) Simple harmonic motion $\theta = \theta_m \sin(\omega_n t + \phi)$

$$\omega_n = \frac{2\pi}{\tau_n} = \frac{2\pi}{(1.3\text{ s})}$$

$$= 4.8332 \text{ rad/s}$$

$$\dot{\theta} = \theta_m \omega_n \cos(\omega_n t + \phi)$$

$$\dot{\theta}_m = \theta_m \omega_n$$

$$v_m = l\dot{\theta}_m = l\theta_m \omega_n$$

Thus, $$\theta_m = \frac{v_m}{l\omega_n} \quad (1)$$

For a simple pendulum, $$\omega_n = \sqrt{\frac{g}{l}}$$

Thus, $$l = \frac{g}{\omega_n^2} = \frac{9.81 \text{ m/s}^2}{(4.8332 \text{ rad/s})^2}$$

$$= 0.41995 \text{ m}$$

Amplitude from (1), $$\theta_m = \frac{v_m}{l\omega_n} = \frac{0.4 \text{ m/s}}{(0.42 \text{ m})(4.833 \text{ rad/s})}$$

$$= 0.19707 \text{ rad}$$

$$= 11.291°$$

$\theta_m = 11.29°$ ◀

(*b*) Maximum tangential acceleration $a_t = l\ddot{\theta}$

The maximum tangential acceleration occurs when $\ddot{\theta}$ is maximum.

$$\ddot{\theta} = -\theta_m \omega_n^2 \sin(\omega_n t + \phi)$$

$$\ddot{\theta}_m = \theta_m \omega_n^2$$

$$(a_t)_m = l\theta_m \omega_n^2$$

$$(a_t)_m = (0.41995 \text{ m})(0.19707 \text{ rad})(4.8332 \text{ rad/s})^2$$

$$= 1.933 \text{ m/s}^2$$

$(a_t)_m = 1.933 \text{ m/s}^2$ ◀

PROBLEM 19.8

A simple pendulum consisting of a bob attached to a cord of length $l = 800$ mm oscillates in a vertical plane. Assuming simple harmonic motion and knowing that the bob is released from rest when $\theta = 6°$, determine (*a*) the frequency of oscillation, (*b*) the maximum velocity of the bob.

SOLUTION

(*a*) Frequency.

$$\omega_n = \sqrt{\frac{g}{l}} = \sqrt{\frac{(9.81\text{ m/s}^2)}{(0.8\text{ m})}}$$

$$\omega_n = 3.502\text{ rad/s}$$

$$f_n = \frac{\omega_n}{2\pi} = \frac{(3.502\text{ rad/s})}{2\pi}$$

$f_n = 0.557$ Hz ◀

(*b*) Simple harmonic motion.

$$\theta = \theta_m \sin(\omega_n t + \phi)$$

where

$$\theta_m = 6° = 0.10472\text{ rad}$$

Maximum velocity.

$$\dot{\theta} = \theta_m \omega_n \cos(\omega_n t + \phi)$$

$$\dot{\theta}_m = \theta_m \omega_n$$

$$v_m = l\dot{\theta}_m = l\theta_m\omega_n = (0.8\text{ m})(0.10472)(3.502)$$

$$v_m = 293.4 \times 10^{-3}\text{ m/s}$$

$v_m = 293$ mm/s ◀

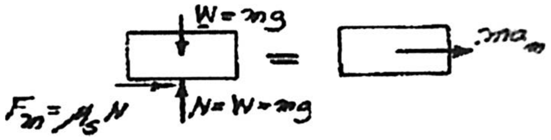
PROBLEM 19.9

An instrument package B is placed on the shaking table C as shown. The table is made to move horizontally in simple harmonic motion with a frequency of 3 Hz. Knowing that the coefficient of static friction is $\mu_s = 0.40$ between the package and the table, determine the largest allowable amplitude of the motion if the package is not to slip on the table. Given the answers in both SI and U.S. customary units.

SOLUTION

<u>Maximum allowable acceleration of *B*.</u>



$$\mu_s = 0.40$$

$\xrightarrow{+} \Sigma F = ma$:

$$F_m = ma_m$$

$$\mu_s mg = ma_m$$

$$a_m = \mu_s g \qquad a_m = 0.40g$$

<u>Simple harmonic motion.</u>

$$f_n = 3\text{ Hz} = \frac{\omega_n}{2\pi}$$

$$\omega_n = 6\pi\text{ rad/s}$$

$$a_m = x_m \omega_n^2$$

$$0.40g = x_m (6\pi\text{ rad/s})^2$$

$$x_m = 1.1258 \times 10^{-3} g$$

<u>Largest allowable amplitude.</u>

<u>SI</u>: $x_m = 1.1258 \times 10^{-3}(9.81) = 11.044 \times 10^{-3}\text{ m}$ $\qquad x_m = 11.04\text{ mm}$ ◀

<u>U.S.</u>: $x_m = 1.1258 \times 10^{-3}(32.2) = 0.03625\text{ ft}$ $\qquad x_m = 0.435\text{ in.}$ ◀

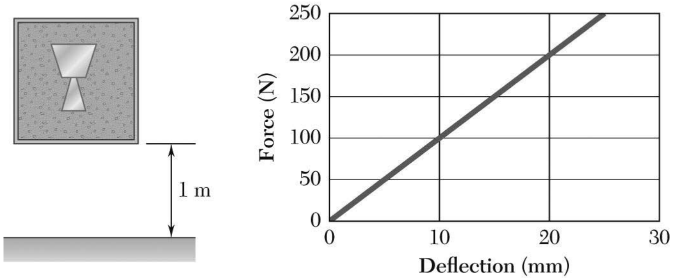
PROBLEM 19.10

A 5-kg fragile glass vase is surrounded by packing material in a cardboard box of negligible weight. The packing material has negligible damping and a force-deflection relationship as shown. Knowing that the box is dropped from a height of 1 m and the impact with the ground is perfectly plastic, determine (*a*) the amplitude of vibration for the vase, (*b*) the maximum acceleration the vase experiences in g's.

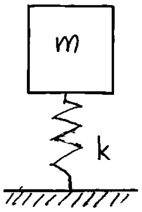


SOLUTION

Velocity at end of free fall: $v = \sqrt{2gh}$

$$v = \sqrt{(2)(9.81\text{ m/s}^2)(1\text{ m})} = 4.4294\text{ m/s}$$

Assume that the spring is unstretched during the free fall. Use a simple spring-mass model for the motion of the vase and the packing material.



$$m = 5\text{ kg}$$

$$k = \frac{100\text{ N}}{10\text{ mm}} \quad \text{(slope from graph)}$$

$$k = 10\text{ N/m} = 10000\text{ N/m}$$

Natural frequency: $\omega_n = \sqrt{\frac{k}{m}} = \sqrt{\frac{10000\text{ N/m}}{5\text{ kg}}} = 44.721\text{ rad/s}$

Simple harmonic motion: $x = x_m \sin(\omega_n t + \phi)$

$$v = \dot{x} = \omega_n x_m \cos(\omega_n t + \phi)$$

Let $t = 0$ at the instant when the box bottom hits the ground.

Then, at $t = 0$, $x = 0$ and $v = 4.4294$ m/s

from which $\phi = 0$

and $\omega_n x_m = 4.4294$ m/s

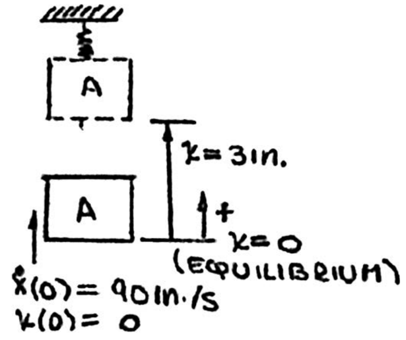
PROBLEM 19.12

In Problem 19.11, determine the position, velocity, and acceleration of the block 0.90 s after it has been struck by the hammer.

SOLUTION



Simple harmonic motion. $x = x_m \sin(\omega_n t + \phi)$

Natural frequency. $\omega_n = \sqrt{\dfrac{k}{m}}, \quad k = 2 \text{ lb/in.} = 24 \text{ lb/ft}$

$$\omega_n = \sqrt{\dfrac{24 \text{ lb/ft}}{\left(\frac{3 \text{ lb}}{32.2 \text{ ft/s}^2}\right)}}$$

$$\omega_n = 16.05 \text{ rad/s}$$

$$x(0) = 0 = x_m \sin(0 + \phi)$$

$$\phi = 0$$

$$\dot{x}(0) = x_m \omega_n \cos(0 + 0) \qquad \dot{x}(0) = \frac{90}{12} = 7.5 \text{ ft/s}$$

$$7.5 = x_m (16.05) \qquad x_m = 0.4673 \text{ ft}$$

$$x = (0.4673)\sin(16.05t)(\text{ft/s})$$

Simple harmonic motion.

$$x = x_m \sin(\omega_n t + \phi)$$

$$\dot{x} = x_m \omega_n \cos(\omega_n t + \phi)$$

$$\ddot{x} = -x_m \omega_n^2 \sin(\omega_n t + \phi)$$

At 0.90 s:

$$x = (0.4673)\sin[(16.05)(0.90)] = 0.445 \text{ ft} \qquad \mathbf{x} = 0.445 \text{ ft} \uparrow \blacktriangleleft$$

$$\dot{x} = (0.4673)(16.05)\cos[(16.05)(0.90)] = -2.27 \text{ ft/s} \qquad \mathbf{v} = 2.27 \text{ ft/s} \downarrow \blacktriangleleft$$

$$\ddot{x} = -(0.4673)(16.05)^2 \sin[(16.05)(0.90)] = -114.7 \text{ ft/s}^2 \qquad \mathbf{a} = 114.7 \text{ ft/s}^2 \downarrow \blacktriangleleft$$

PROBLEM 19.13

The bob of a simple pendulum of length $l = 40$ in. is released from rest when $\theta = +5°$. Assuming simple harmonic motion, determine 1.6 s after release (*a*) the angle θ, (*b*) the magnitudes of the velocity and acceleration of the bob.

SOLUTION

For simple harmonic motion and $l = 40\text{ in.} = 3.333\text{ ft}$:

$$\omega_n = \sqrt{\frac{g}{l}} = \sqrt{\frac{32.2\text{ ft/s}^2}{3.333\text{ ft}}} = 3.1082\text{ rad/s}$$

Angular displacement: $\theta = \theta_m \sin(\omega_n t + \phi)$

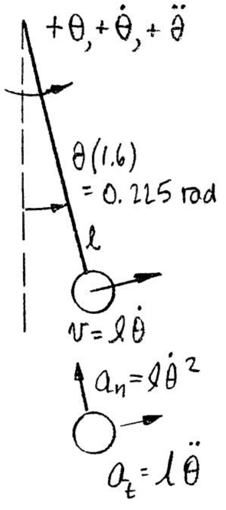
Initial conditions: $\theta(0) = 5° = 0.08727\text{ rad}, \quad \text{and} \quad \dot{\theta}(0) = 0$:

$$\dot{\theta}(0) = 0 = \theta_m \omega_n \cos(0 + \phi) \qquad \phi = \frac{\pi}{2}$$

$$\theta_m = \theta(0) = \frac{5\pi}{180} = 0.08727\text{ rad}$$

$$\theta = \frac{5\pi}{180}\sin\left[(3.1082\text{ rad/s})t + \frac{\pi}{2}\right]$$

$$= (0.08727\text{ rad})\sin\left[(3.1082\text{ rad/s})t + \frac{\pi}{2}\right]$$



(*a*) At $t = 1.6$ s.

$$\theta = \frac{5\pi}{180}\sin\left[(3.1082\text{ rad/s})(1.6\text{ s}) + \frac{\pi}{2}\right]$$

$$= 0.022496\text{ rad} = 1.288°$$

$\theta = 1.288°$ ◀

(*b*) Velocity:

$$\dot{\theta} = \theta_m \omega_n \cos(\omega_n t + \phi)$$

$$= \frac{5\pi}{180}(3.1082\text{ rad/s})\cos\left[(3.1082\text{ rad/s})(1.6\text{ s}) + \frac{\pi}{2}\right]$$

$$= 0.262074\text{ rad/s}$$

$$v = l\dot{\theta} = (3.3333\text{ ft})(0.262074\text{ rad/s}) = 0.874\text{ ft/s}$$

$v = 0.874\text{ ft/s}$ ◀

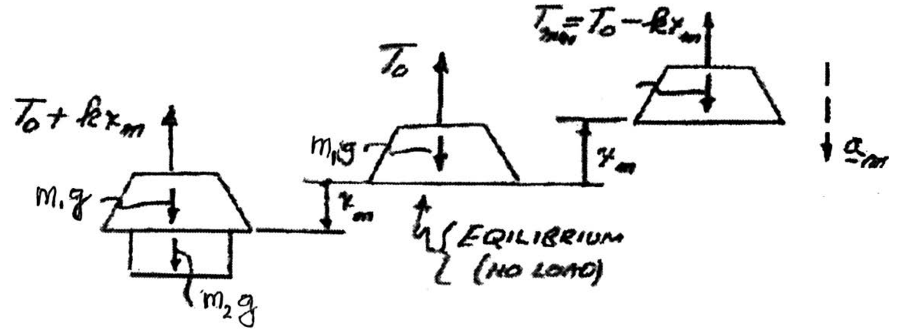
PROBLEM 19.14

A 150-kg electromagnet is at rest and is holding 100 kg of scrap steel when the current is turned off and the steel is dropped. Knowing that the cable and the supporting crane have a total stiffness equivalent to a spring of constant 200 kN/m, determine (*a*) the frequency, the amplitude, and the maximum velocity of the resulting motion, (*b*) the minimum tension which will occur in the cable during the motion, (*c*) the velocity of the magnet 0.03 s after the current is turned off.

SOLUTION



<u>Data</u>: $m_1 = 150$ kg $\quad m_2 = 100$ kg $\quad k = 200 \times 10^3$ N/m

From the first two sketches, $\quad T_0 + kx_m = (m_1 + m_2)g \quad (1)$

$$T_0 = m_1 g \quad (2)$$

Subtracting Eq. (2) from Eq. (1), $\quad kx_m = m_2 g$

$$x_m = \frac{m_2 g}{k} = \frac{(100)(9.81)}{200 \times 10^3} = 4.905 \times 10^{-3} \text{ m} = 4.91 \text{ mm}$$

Natural circular frequency: $\quad \omega_n = \sqrt{\frac{k}{m_1}} = \sqrt{\frac{200 \times 10^3}{150}} = 36.515$ rad/s

Natural frequency: $\quad f_n = \frac{\omega_n}{2\pi} = \frac{36.515}{2\pi} \qquad f_n = 5.81$ Hz

Maximum velocity: $\quad v_m = \omega_n x_m = (36.515)(4.905 \times 10^{-3}) = 0.1791$ m/s

(*a*) Resulting motion: amplitude $x_m = 4.91$ mm ◀

frequency $f_n = 5.81$ Hz ◀

maximum velocity $v_m = 0.1791$ m/s ◀

PROBLEM 19.15

A variable-speed motor is rigidly attached to beam BC. The rotor is slightly unbalanced and causes the beam to vibrate with a frequency equal to the motor speed. When the speed of the motor is less than 600 rpm or more than 1200 rpm, a small object placed at A is observed to remain in contact with the beam. For speeds between 600 rpm and 1200 rpm, the object is observed to "dance" and actually to lose contact with the beam. Determine the amplitude of the motion of A when the speed of the motor is (*a*) 600 rpm, (*b*) 1200 rpm. Give answers in both SI and U.S. customary units.

SOLUTION

At both 600 rpm and 1200 rpm, the maximum acceleration is just equal to g.

(*a*) $\omega = 600 \text{ rpm} = 62.832 \text{ rad/s}$

Eq. (19.15): $a_m = x_m\omega^2 \qquad x_m = \dfrac{g}{(62.832)^2}$

SI: $x_m = \dfrac{9.81}{(62.832)^2} = 2.4849 \times 10^{-3} \text{ m}$ $\qquad x_m = 2.48 \text{ mm}$ ◀

US: $x_m = \dfrac{32.2}{(62.832)^2} = 0.008156 \text{ ft}$ $\qquad x_m = 0.0979 \text{ in.}$ ◀

(*b*) $\omega = 1200 \text{ rpm} = 125.664 \text{ rad/s}$

Eq. (19.15): $a_m = x_m\omega^2 \qquad x_m = \dfrac{g}{(125.664)^2}$

SI: $x_m = \dfrac{9.81}{(125.664)^2} = 621.2 \times 10^{-6} \text{ m}$ $\qquad x_m = 0.621 \text{ mm}$ ◀

US: $x_m = \dfrac{32.2}{(125.664)^2} = 0.002039 \text{ ft}$ $\qquad x_m = 0.0245 \text{ in.}$ ◀

PROBLEM 19.16

A small bob is attached to a cord of length 1.2 m and is released from rest when $\theta_A = 5°$. Knowing that $d = 0.6$ m, determine (*a*) the time required for the bob to return to Point *A*, (*b*) the amplitude θ_C.

SOLUTION

As the pendulum moves between Points *A* and *B*, the length of the pendulum is $l = l_{AB} = 1.2$ m.

$$\omega_n = \omega_{n1} = \sqrt{\frac{g}{l_{AB}}} = \sqrt{\frac{9.81\text{ m/s}^2}{1.2\text{ m}}} = 2.8592\text{ rad/s}$$

$$\tau_1 = \frac{2\pi}{\omega_{n1}} = \frac{2\pi}{2.8592\text{ rad/s}} = 2.1975\text{ s}$$

The falling from *A* to *B* is one quarter period.

$$\tau_{AB} = \frac{1}{4}\tau_1 = 0.54938\text{ s.}$$

As the pendulum moves between Points *B* and *C*, the length of the pendulum is
$l = l_{BC} = 1.2\text{ m} - 0.6\text{ m} = 0.6\text{ m}$.

$$\omega_n = \omega_{n2} = \sqrt{\frac{g}{l_{BC}}} = \sqrt{\frac{9.81\text{ m/s}^2}{0.6\text{ m}}} = 4.0435\text{ rad/s}$$

$$\tau_2 = \frac{2\pi}{\omega_{n2}} = \frac{2\pi}{4.0435\text{ rad/s}} = 1.55389\text{ s}$$

The motion from *B* to *C* and back to *B* is one half period

$$\tau_{BCB} = \frac{1}{2}\tau_2 = 0.77695\text{ s}$$

As the pendulum moves from *B* to *A*, the length is again 1.2 meters.

$$\tau_{BA} = \frac{1}{4}\tau_1 = 0.54938\text{ s}$$

(*a*) Time required to return to *A*.

$$\tau = \tau_{AB} + \tau_{BCB} + \tau_{BA}$$
$$\tau = 1.87571\text{ s}$$

$\tau = 1.876$ s ◀

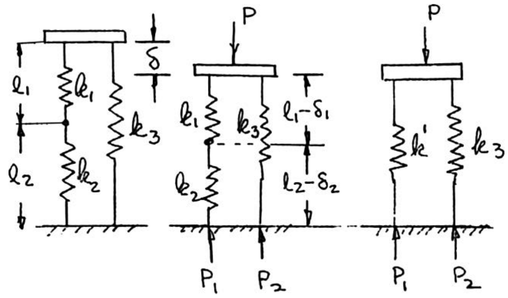
PROBLEM 19.20

A 13.6-kg block is supported by the spring arrangement shown. If the block is moved from its equilibrium position 44 mm vertically downward and released, determine (*a*) the period and frequency of the resulting motion, (*b*) the maximum velocity and acceleration of the block.

SOLUTION



Determine the constant k of a single spring equivalent to the three springs shown.

Springs 1 and 2: $\delta = \delta_1 + \delta_2$, and $\dfrac{P_1}{k'} = \dfrac{P_1}{k_1} + \dfrac{P_1}{k_2}$

Hence, $k' = \dfrac{k_1 k_2}{k_1 + k_2}$

where k' is the spring constant of a single spring equivalent of springs 1 and 2.
Springs k' and 3: (Deflection in each spring is the same).

So $P = P_1 + P_2$, and $P = k\delta$, $P_1 = k'\delta$, $P_2 = k_3\delta$

Now $k\delta = k'\delta + k_3\delta$

$$k = k' + k_3 = \frac{k_1 k_2}{k_1 + k_2} + k_3$$

or $$k = \frac{(3.5\text{ kN/m})(2.1\text{ kN/m})}{(3.5\text{ kN/m}) + (2.1\text{ kN/m})} + 2.8\text{ kN/m} = 4.11\text{ kN/m} = 4.11\times10^3\text{ N/m}$$

(*a*) Period and frequency: $\tau_n = \dfrac{2\pi}{\sqrt{\frac{k}{m}}} = \dfrac{2\pi}{\sqrt{\frac{4.11\times10^3\text{ N/m}}{13.6\text{ kg}}}}$ $t_n = 0.361\text{ s}$ ◀

$f_n = \dfrac{1}{\tau_n} = \dfrac{1}{0.3614\text{ s}}$ $f_n = 2.77\text{ Hz}$ ◀

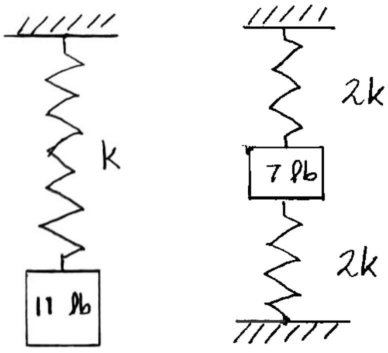
PROBLEM 19.21

A 11-lb block, attached to the lower end of a spring whose upper end is fixed, vibrates with a period of 7.2 s. Knowing that the constant k of a spring is inversely proportional to its length (e.g., if you cut a 10 lb/in. spring in half, the remaining two springs each have a spring constant of 20 lb/in.), determine the period of a 7-lb block which is attached to the center of the same spring if the upper and lower ends of the spring are fixed.

SOLUTION

<u>Equivalent spring constant</u>.

$$k' = 2k + 2k = 4k \qquad \text{(Deflection of each spring is the same.)}$$



For case ①,

$$\tau_{n1} = 7.2 \text{ s}$$

$$\omega_{n1} = \frac{2\pi}{\tau_{n1}} = \frac{2\pi}{7.2} = 0.87266 \text{ rad/s}$$

$$\omega_n^2 = \frac{k}{m_1}$$

$$k = m_1\omega_{n1}^2 = \left(\frac{11}{32.2}\right)(0.87266)^2 = 0.26015 \text{ lb/ft}$$

For case ②,

$$\omega_{n2}^2 = \frac{4k}{m_2} = \frac{(4)(0.26015)}{\frac{7}{32.2}} = 4.7868 \text{ (rad/s)}^2$$

$$\omega_{n2} = 2.1879 \text{ rad/s}$$

$$\tau_n = \frac{2\pi}{\omega_{n2}} = \frac{2\pi}{2.1879}$$

$\tau_{n2} = 2.87 \text{ s}$ ◀

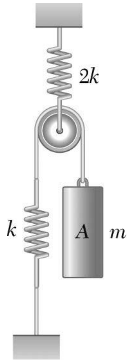
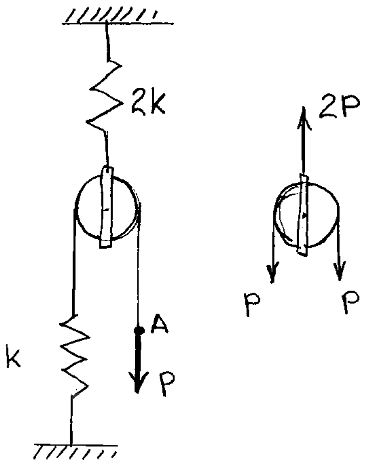
PROBLEM 19.22



Block A of mass m is supported by the spring arrangement as shown. Knowing that the mass of the pulley is negligible and that the block is moved vertically downward from its equilibrium position and released, determine the frequency of the motion.

SOLUTION

We first determine the constant k_{eq} of a single spring equivalent to the spring and pulley system supporting the block by finding the total displacement δ_A of the end of the cable under a given static load **P**. Owing to the force $2P$ in the upper spring the pulley moves down a distance



$$\delta_1 = \frac{2P}{2k}$$

Owing to the force P in the lower spring, Point A moves down an additional distance

$$\delta_2 = \frac{P}{k}$$

The total displacement is

$$\delta_A = \delta_1 + \delta_2 = \frac{2P}{2k} + \frac{P}{k} = \frac{2P}{k}$$

But $\delta_A = \dfrac{P}{k_{eq}}$ so that

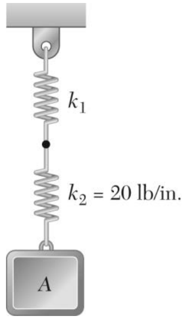
$$k_{eq} = \frac{k}{2}$$

Natural frequency:

$$\omega_n = \sqrt{\frac{k_{eq}}{m}}$$

$$\omega_n = \sqrt{\frac{k}{2\,m}} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. If you are a student using this Manual, you are using it without permission.*



PROBLEM 19.23

The period of vibration of the system shown is observed to be 0.2 s. After the spring of constant $k_2 = 20$ lb/in. is removed and block A is connected to the spring of constant k_1, the period is observed to be 0.12 s. Determine (*a*) the constant k_1 of the remaining spring, (*b*) the weight of block A.

SOLUTION

Equivalent spring constant for springs in series.

$$k_e = \frac{k_1 k_2}{(k_1 + k_2)}$$

For k_1 and k_2,

$$\tau = \frac{2\pi}{\sqrt{\frac{k_e}{m_A}}} = \frac{2\pi}{\sqrt{\frac{(k_1 k_2)}{(m_A)(k_1+k_2)}}}$$

For k_1 alone,

$$\tau' = \frac{2\pi}{\sqrt{\frac{k_1}{m_A}}}$$

(*a*)

$$\frac{\tau}{\tau'} = \sqrt{\frac{(k_1 + k_2)(k_1)}{(k_1 k_2)}} = \sqrt{\frac{k_1 + k_2}{k_2}}$$

$$k_2 \left(\frac{\tau}{\tau'}\right)^2 = k_1 + k_2$$

$$\frac{\tau}{\tau'} = \frac{0.2 \text{ s}}{0.12 \text{ s}} = 1.6667$$

$$k_2 = 20 \text{ lb/in.}$$

$$(20 \text{ lb/in.})(1.6667)^2 = k_1 + 20 \text{ lb/in.}$$

$k_1 = 35.6$ lb/in. ◀

(*b*)

$$\tau' = \frac{2\pi}{\sqrt{\frac{k_1}{m_A}}} \qquad m_A = \frac{W_A}{g}$$

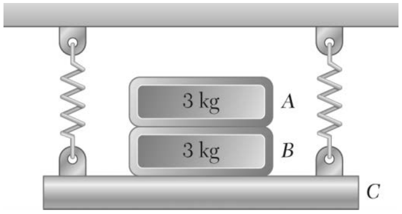
$$m_A = \frac{(\tau')^2 k_1}{(2\pi)^2}$$

$$k_1 = 35.6 \text{ lb/in.} = 426.7 \text{ lb/ft}$$

$$W_A = \frac{(32.2 \text{ ft/s}^2)(0.12 \text{ s})^2 (426.7 \text{ lb/ft})}{(2\pi)^2}$$

$W_A = 5.01$ lb ◀

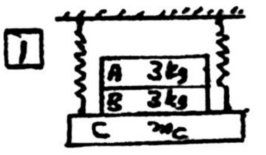
PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



PROBLEM 19.24

The period of vibration of the system shown is observed to be 0.8 s. If block A is removed, the period is observed to be 0.7 s. Determine (a) the mass of block C, (b) the period of vibration when both blocks A and B have been removed.

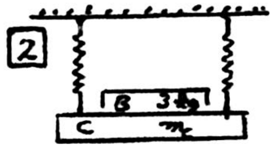
SOLUTION



$$m_1 = m_C + 6 \text{ kg} \qquad \tau_1 = 0.8 \text{ s}$$

$$\omega_1 = \frac{2\pi}{\tau_1} = \frac{2\pi}{0.8 \text{ s}} = \frac{2\pi}{0.8} \text{ rad/s}$$

$$\omega_1^2 = \frac{k}{m_1}; \quad k = m_1\omega_1^2 = (m_C + 6)\left(\frac{2\pi}{0.8}\right)^2 \qquad (1)$$



$$m_2 = m_C + 3 \text{ kg} \quad \tau_2 = 0.7 \text{ s}$$

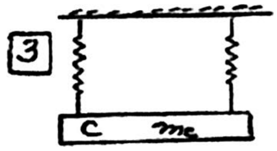
$$\omega_2 = \frac{2\pi}{\tau_2} = \frac{2\pi}{0.7 \text{ s}} = \frac{2\pi}{0.7} \text{ rad/s}$$

$$\omega_2^2 = \frac{k}{m_2}; \quad k = m_2\omega_2^2 = (m_C + 3)\left(\frac{2\pi}{0.7}\right)^2 \qquad (2)$$

Equating the expressions found for k in Eqs. (1) and (2):

$$(m_C + 6)\left(\frac{2\pi}{0.8}\right)^2 = (m_C + 3)\left(\frac{2\pi}{0.7}\right)^2$$

$$\frac{m_C + 6}{m_C + 3} = \left(\frac{0.8}{0.7}\right)^2; \quad \text{Solve for } m_C: \qquad m_C = 6.80 \text{ kg} \blacktriangleleft$$



$$\omega_3 = \frac{2\pi}{\tau_3}$$

$$\omega_3^2 = \frac{k}{m_C}; \quad k = m_C\omega_3^2 = m_C\left(\frac{2\pi}{\tau_3}\right)^2 \qquad (3)$$

Equating expressions for k from Eqs. (2) and (3),

$$(m_C + 3)\left(\frac{2\pi}{0.7}\right)^2 = m_C\left(\frac{2\pi}{\tau_3}\right)^2$$

Recall $m_C = 6.8$ kg:

$$(6.8 + 3)\left(\frac{2\pi}{0.7}\right)^2 = 6.8\left(\frac{2\pi}{\tau_3}\right)^2$$

$$\left(\frac{\tau_3}{0.7}\right)^2 = \frac{6.8}{9.8}; \quad \frac{\tau_3}{0.7} = 0.833 \qquad \tau_3 = 0.583 \text{ s} \blacktriangleleft$$

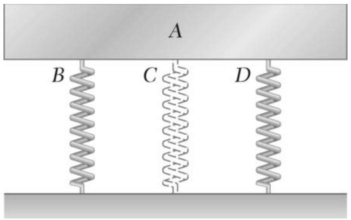
PROBLEM 19.25



The 100-lb platform A is attached to springs B and D, each of which has a constant $k = 120$ lb/ft. Knowing that the frequency of vibration of the platform is to remain unchanged when an 80-lb block is placed on it and a third spring C is added between springs B and D, determine the required constant of spring C.

SOLUTION

Frequency of the original system.

Springs B and D are in parallel. $k_e = k_B + k_D = 2(120 \text{ lb/ft}) = 240 \text{ lb/ft}$

$$\omega_n^2 = \frac{k_e}{m_A} = \frac{240 \text{ lb/ft}}{\left(\frac{100 \text{ lb}}{32.2 \text{ ft/s}^2}\right)}$$

$$\omega_n^2 = 77.28 \,(\text{rad/s})^2$$

Frequency of new system.

Springs A, B, and C are in parallel. $k_e' = k_B + k_D + k_C = (2)(120) + k_e$

$$(\omega_n')^2 = \frac{k_e'}{m_A + m_B} = \frac{(240 + k_C)(32.2 \text{ ft/s}^2)}{(100 \text{ lb} + 80 \text{ lb})}$$

$$(\omega_n')^2 = (0.1789)(240 + k_C)$$

$$\omega_n^2 = (\omega_n')^2$$

$$77.28 = (0.1789)(240 + k_C)$$

$$k_C = 191.97 \text{ lb/ft}$$

$k_C = 192.0$ lb/ft ◀

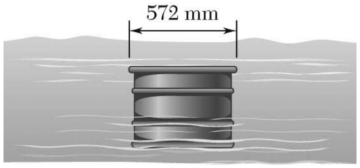
PROBLEM 19.26



The period of vibration for a barrel floating in salt water is found to be 0.58 s when the barrel is empty and 1.8 s when it is filled with 55 gallons of crude oil. Knowing that the density of the oil is 900 kg/m^3, determine (*a*) the mass of the empty barrel, (*b*) the density of the salt water, ρ_{sw}. [*Hint*: the force of the water on the bottom of the barrel can be modeled as a spring with constant $k = \rho_{sw} g A$.]

SOLUTION

Area of bottom of barrel: $A = \dfrac{\pi D^2}{4} = \dfrac{\pi(0.572\text{ m})^2}{4} = 0.2570\text{ m}^2$

Mass of oil: $m_{\text{oil}} = (55\text{ gal})\left(\dfrac{1\text{ m}^3}{264.172\text{ gal}}\right)(900\text{ kg/m}^3) = 187.378\text{ kg}$

Barrel empty: $\tau_1 = 0.58\text{ s}$

$$\omega_{n1} = \frac{2\pi}{\tau_1} = \frac{2\pi}{0.58\text{ s}} = 10.833\text{ rad/s}$$

$$\omega_{n1} = \sqrt{\frac{k}{m_b}} \qquad (1)$$

Barrel full: $\tau_2 = 1.8\text{ s}$

$$\omega_{n2} = \frac{2\pi}{\tau_2} = \frac{2\pi}{1.8\text{ s}} = 3.4907\text{ rad/s}$$

$$\omega_{n2} = \sqrt{\frac{k}{m}} = \sqrt{\frac{k}{m_{\text{oil}} + m_b}} \qquad (2)$$

(*a*) Mass m_b of empty barrel.

Divide Eq. (1) by Eq. (2) and square both sides.

$$\frac{\omega_{n1}^2}{\omega_{n2}^2} = \frac{(10.833)^2}{(3.4907)^2} = 9.6310 = \frac{m_{\text{oil}} + m_b}{m_b}$$

$$9.6310\, m_b = m_{\text{oil}} + m_b$$

$$m_b = \frac{m_{\text{oil}}}{9.6310 - 1} = \frac{187.378\text{ kg}}{8.6310} = 21.710\text{ kg}$$

$m_b = 21.7\text{ kg}$ ◀

Spring constant: $k = m_b \omega_{n1}^2 = (21.710)(10.833)^2 = 2.5477 \times 10^3\text{ N/m}$

PROBLEM 19.33*

Expanding the integrand in Equation (19.19) of Section 19.4 into a series of even powers of $\sin\phi$ and integrating, show that the period of a simple pendulum of length l may be approximated by the formula

$$\tau = 2\pi\sqrt{\frac{l}{g}}\left(1+\frac{1}{4}\sin^2\frac{\theta_m}{2}\right)$$

where θ_m is the amplitude of the oscillations.

SOLUTION

Using the Binomial Theorem, we write

$$\frac{1}{\sqrt{1-\sin^2\left(\frac{\theta_m}{2}\right)\sin^2\phi}} = \left[1-\sin^2\left(\frac{\theta_m}{2}\right)\sin\phi\right]^{-1/2}$$

$$= 1+\frac{1}{2}\sin^2\frac{\theta_m}{2}\sin^2\phi+\cdots$$

Neglecting terms of order higher than 2 and setting $\sin^2\phi = \frac{1}{2}(1-\cos 2\phi)$, we have

$$\tau_n = 4\sqrt{\frac{l}{g}}\int_0^{\pi/2}\left\{1+\frac{1}{2}\sin^2\frac{\theta_m}{2}\left[\frac{1}{2}(1-\cos 2\phi)\right]\right\}d\phi$$

$$= 4\sqrt{\frac{l}{g}}\int_0^{\pi/2}\left\{1+\frac{1}{4}\sin^2\frac{\theta_m}{2}-\frac{1}{4}\sin^2\frac{\theta_m}{2}\cos 2\phi\right\}d\phi$$

$$= 4\sqrt{\frac{l}{g}}\left[\phi+\frac{1}{4}\left(\sin^2\frac{\theta_m}{2}\right)\phi-\frac{1}{8}\sin^2\frac{\theta_m}{2}\sin 2\phi\right]_0^{\pi/2}$$

$$= 4\sqrt{\frac{l}{g}}\left[\frac{\pi}{2}+\frac{1}{4}\left(\sin^2\frac{\theta_m}{2}\right)\frac{\pi}{2}+0\right]$$

$$\tau_n = 2\pi\sqrt{\frac{l}{g}}\left(1+\frac{1}{4}\sin^2\frac{\theta_m}{2}\right) ◀$$

If you are a student using this Manual, you are using it without permission.*

PROBLEM 19.34*

Using the formula given in Problem 19.33, determine the amplitude θ_m for which the period of a simple pendulum is $\frac{1}{2}$ percent longer than the period of the same pendulum for small oscillations.

SOLUTION

For small oscillations, $$(\tau_n)_0 = 2\pi\sqrt{\frac{l}{g}}$$

We want $$\tau_n = 1.005(\tau_n)_0$$
$$= 1.005\ 2\pi\sqrt{\frac{l}{g}}$$

Using the formula of Problem 19.33, we write

$$\tau_n = (\tau_n)_0\left(1 + \frac{1}{4}\sin^2\frac{\theta_m}{2}\right)$$
$$= 1.005(\tau_n)_0$$
$$\sin^2\frac{\theta_m}{2} = 4[1.005 - 1] = 0.02$$
$$\sin\frac{\theta_m}{2} = \sqrt{0.02}$$
$$\frac{\theta_m}{2} = 8.130°$$

$\theta_m = 16.26°$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 19.35*

Using the data of Table 19.1, determine the period of a simple pendulum of length $l = 750$ mm (*a*) for small oscillations, (*b*) for oscillations of amplitude $\theta_m = 60°$, (*c*) for oscillations of amplitude $\theta_m = 90°$.

SOLUTION

(*a*) $\tau_n = 2\pi\sqrt{\frac{l}{g}}$ (Equation 19.18 for small oscillations):

$$\tau_n = 2\pi\sqrt{\frac{0.750\text{ m}}{9.81\text{ m/s}^2}}$$

$$= 1.737\text{ s} \qquad \tau_n = 1.737\text{ s} \blacktriangleleft$$

(*b*) For large oscillations (Eq. 19.20),

$$\tau_n = \left(\frac{2K}{\pi}\right)\left(2\pi\sqrt{\frac{l}{g}}\right)$$

$$= \frac{2K}{\pi}(1.737\text{ s})$$

For $\theta_m = 60°$, $K = 1.686$ (Table 19.1)

$$\tau_n(60°) = \frac{2(1.686)(1.737\text{ s})}{\pi}$$

$$= 1.864\text{ s} \qquad \tau_n = 1.864\text{ s} \blacktriangleleft$$

(*c*) For $\theta_m = 90°$, $K = 1.854$ $\qquad \tau_n = \frac{2(1.854)(1.737\text{ s})}{\pi} = 2.05\text{ s} \blacktriangleleft$

If you are a student using this Manual, you are using it without permission.*

PROBLEM 19.36*

Using the data of Table 19.1, determine the length in inches of a simple pendulum which oscillates with a period of 2 s and an amplitude of 90°.

SOLUTION

For large oscillations (Eq. 19.20),

$$\tau_n = \left(\frac{2K}{\pi}\right)\left(2\pi\sqrt{\frac{l}{g}}\right)$$

for $\theta_m = 90°$

$$K = 1.854 \text{ (Table 19.1)}$$

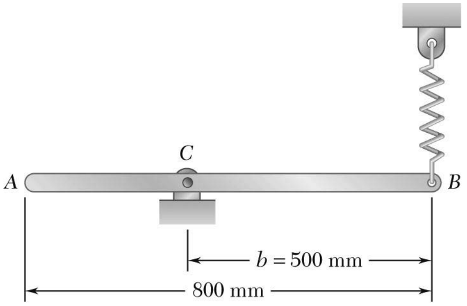
$$(2 \text{ s}) = (2)(1.854)(2)\sqrt{\frac{l}{32.2 \text{ ft/s}^2}}$$

$$l = \frac{(2 \text{ s})^2(32.2 \text{ ft/s}^2)}{[(4)(1.854)]^2}$$

$$= 2.342 \text{ ft}$$

$l = 28.1$ in. ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

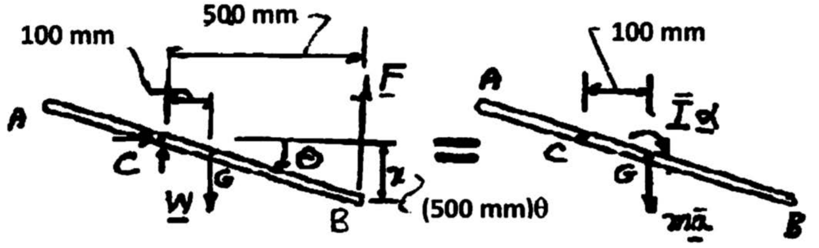


PROBLEM 19.37

The uniform rod shown has mass 6 kg and is attached to a spring of constant $k = 700$ N/m. If end B of the rod is depressed 10 mm and released, determine (a) the period of vibration, (b) the maximum velocity of end B.

SOLUTION

$$k = 700 \text{ N/m}$$
$$W = mg$$



where
$$F = k(x + \delta_{st})$$
$$= k(0.5\theta + \delta_{st})$$
$$m\bar{a} = m\bar{r}\alpha = 6(0.1\text{ m})\ddot{\theta} = 0.6\ddot{\theta}$$
$$\bar{I}\alpha = \frac{1}{12}(6)(0.8\text{ m})^2\ddot{\theta}$$
$$= 0.32\ddot{\theta}$$

(a) Equation of motion.

$$+\circlearrowright \Sigma M_C = \bar{I}\alpha + m\bar{a}d: \quad W(0.1\text{ m}) - F(0.5\text{ m}) = \bar{I}\alpha + m\bar{a}(0.1\text{ m})$$
$$W(0.1) - k(0.5\theta + \delta_{st})(0.5\text{ m}) = 0.32\ddot{\theta} + 0.6\ddot{\theta}(0.1)$$

But in equilibrium, we have $+\circlearrowright W(0.1\text{ m}) - k\delta_{st}(0.5\text{ m}) = 0$

Thus,
$$-k(0.5)^2\theta = [0.32 + 0.06]\ddot{\theta}$$
$$-(700\text{ N/m})(0.5)^2\theta = 0.38\ddot{\theta}$$
$$\ddot{\theta} + (460.53)\theta = 0$$

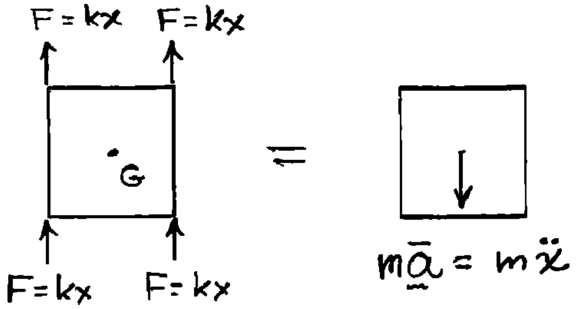
PROBLEM 19.43

A square plate of mass m is held by eight springs, each of constant k. Knowing that each spring can act in either tension or compression, determine the frequency of the resulting vibration (a) if the plate is given a small vertical displacement and released, (b) if the plate is rotated through a small angle about G and released.

SOLUTION

(a) Small vertical displacement.

Let the plate be displaced downward a distance x from the equilibrium position. Each corner moves downward a distance x and the four vertical springs exert additional forces kx for each spring. The horizontal springs exert negligible change.



$$+\downarrow \Sigma F = ma: \quad -4kx = m\ddot{x}$$

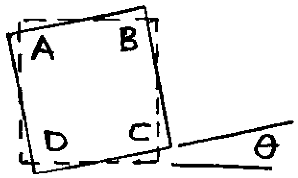
$$\ddot{x} + \frac{4k}{m}x = 0$$

$$\omega_n^2 = \frac{4k}{m}$$

Frequency: $$f = \frac{\omega_n}{2\pi} = \frac{1}{2\pi}\sqrt{\frac{4k}{m}}$$ $$f = 0.318\sqrt{\frac{k}{m}} \blacktriangleleft$$

(b) Small rotation about G.

Let the plate be rotated through a small counterclockwise angle θ from the equilibrium position. The corners A, B, C, and D move as indicated below:



A: $(l/2)\theta\downarrow + (l/2)\theta \longleftarrow$

B: $(l/2)\theta \longleftarrow + (l/2)\theta\uparrow$

C: $(l/2)\theta\uparrow + (l/2)\theta \longleftarrow$

D: $(l/2)\theta \longrightarrow + (l/2)\theta\downarrow$

The additional force exerted by each of the eight springs is $F = (kl/2)\theta$ and directed as shown on the free body diagram. The eight forces reduce to four clockwise couples, each of magnitude Fl. For a square plate

$$\bar{I} = \frac{1}{6}ml^2$$

If you are a student using this Manual, you are using it without permission.*

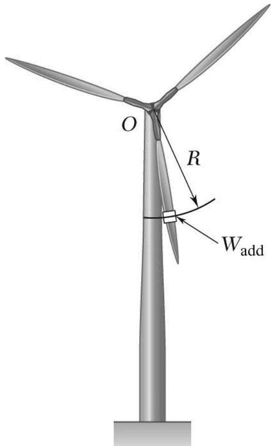
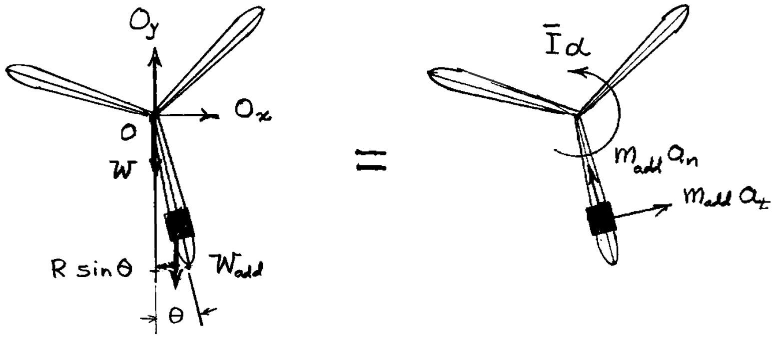
PROBLEM 19.46



A three-bladed wind turbine used for research is supported on a shaft so that it is free to rotate about O. One technique to determine the centroidal mass moment of inertia of an object is to place a known weight at a known distance from the axis of rotation and to measure the frequency of oscillations after releasing it from rest with a small initial angle. In this case, a weight of $W_{add} = 50$ lb is attached to one of the blades at a distance $R = 20$ ft from the axis of rotation. Knowing that when the blade with the added weight is displaced slightly from the vertical axis, the system is found to have a period of 7.6 s, determine the centroidal mass moment of inertia of the 3-bladed rotor.

SOLUTION

Let the turbine rotor be turned counterclockwise through a small angle θ. The moment of the added weight about Point O is



$$M = -W_{add} R \sin\theta$$

$$+\circlearrowleft \Sigma M_0 = \Sigma (M_0)_{eff}: \quad -W_{add} R \sin\theta = \bar{I}\alpha + m_{add} R a_a$$

$$= (\bar{I} + m_{add} R^2)\alpha$$

$$= (\bar{I} + m_{add} R^2)\ddot{\theta}$$

$$\ddot{\theta} + \frac{W_{add} R}{\bar{I} + m_{add} R^2} \sin\theta = 0$$

Using $\sin\theta \approx \theta$ gives

$$\ddot{\theta} + \frac{W_{add} R}{\bar{I} + m_{add} R^2} \theta = 0$$

$$\ddot{\theta} + \omega_n^2 \theta = 0 \qquad \omega_n^2 = \frac{W_{add} R}{\bar{I} + m_{add} R^2}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 19.46 (Continued)

Solving for $\bar{I}$,

$$\bar{I} = \frac{W_{\text{add}} R}{\omega_n^2} - m_{\text{add}} R^2 \quad (1)$$

Data: $R = 20 \text{ ft}, \quad W_{\text{add}} = 50 \text{ lb}$

$$m_{\text{add}} = \frac{W_{\text{add}}}{g} = \frac{50 \text{ lb}}{32.2 \text{ ft/s}^2} = 1.5528 \text{ lb} \cdot \text{s}^2/\text{ft}$$

Period and frequency: $\tau = 7.6 \text{ s}$

$$f = \frac{1}{\tau} = \frac{1}{7.6} \text{Hz}$$

$$\omega_n = 2\pi f = \frac{2\pi}{7.6} = 0.82673 \text{ rad/s}$$

From Eq. (1),

$$\bar{I} = \frac{(50 \text{ lb})(20 \text{ ft})}{(0.82673 \text{ rad/s})^2} - (1.5528 \text{ lb} \cdot \text{s}^2/\text{ft})(20 \text{ ft})^2$$

$$= 1463.10 - 621.12$$

$$\bar{I} = 842 \text{ lb} \cdot \text{s}^2 \cdot \text{ft} \blacktriangleleft$$

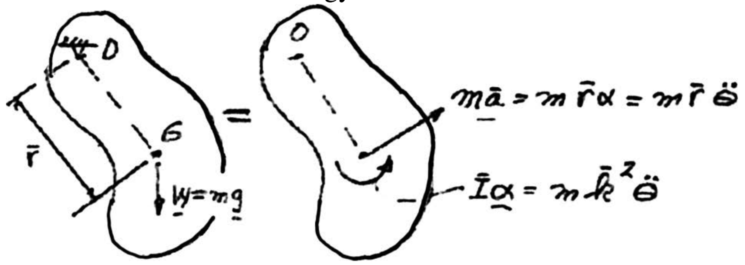
PROBLEM 19.47

A connecting rod is supported by a knife-edge at Point *A*; the period of its small oscillations is observed to be 0.87 s. The rod is then inverted and supported by a knife-edge at Point *B* and the period of small oscillations is observed to be 0.78 s. Knowing that $r_a + r_b = 10$ in. determine (*a*) the location of the mass center *G*, (*b*) the centroidal radius of gyration $\bar{k}$.

SOLUTION

Consider general pendulum of centroidal radius of gyration $\bar{k}$.



Equation of motion. $\circlearrowleft + \Sigma M_0 = \Sigma (M_0)_{\text{eff}}: \quad -mg\bar{r}\sin\theta = (m\bar{r}\ddot{\theta})\bar{r} + m\bar{k}^2\ddot{\theta}$

$$\ddot{\theta} + \left[\frac{g\bar{r}}{\bar{r}^2 + \bar{k}^2}\right]\sin\theta = 0$$

For small oscillations, $\sin\theta \approx \theta$, we have

$$\ddot{\theta} + \left[\frac{g\bar{r}}{\bar{r}^2 + \bar{k}^2}\right]\theta = 0$$

$$\omega_n^2 = \frac{g\bar{r}}{\bar{r}^2 + \bar{k}^2}$$

$$\tau = \frac{2\pi}{\omega_n} = 2\pi\sqrt{\frac{\bar{r}^2 + \bar{k}^2}{g\bar{r}}}$$

For rod suspended at *A*,

$$\tau_A = 2\pi\sqrt{\frac{r_a^2 + \bar{k}^2}{g r_a}}$$

$$g\tau_A^2 r_a = 4\pi^2\left(r_a^2 + \bar{k}^2\right) \qquad (1)$$

For rod suspended at *B*,

$$\tau_B = 2\pi\sqrt{\frac{r_b^2 + \bar{k}^2}{g r_b}}$$

$$g\tau_B^2 r_b = 4\pi^2\left(r_b^2 + \bar{k}^2\right) \qquad (2)$$

PROBLEM 19.50 (Continued)

Natural frequency. $$\omega_n^2 = \frac{\left(\frac{L}{2} + \frac{m_C}{m_R} d\right) g}{\frac{L^2}{3} + \frac{m_C}{m_R} d^2} = \frac{\left(\frac{3L}{2} + d\right) g}{(L^2 + d^2)}$$

(*a*) To maximize the frequency, we need to take the derivative with respect to *d* and set it equal to zero.

$$\frac{1}{g}\frac{d\left(\omega_n^2\right)}{d(d)} = \frac{(L^2 + d^2)(1) - \left(\frac{3L}{2} + d\right)(2d)}{(L^2 + d^2)^2} = 0$$

$$d^2 + L^2 - 3Ld - 2d^2 = 0$$

$$d^2 + 3Ld - L^2 = 0$$

Solve for *d* knowing that $L = 0.75$ m $\quad d = 0.22708 \quad \text{or} \quad -2.4771$

$$d = 0.22708 \text{ m}$$

$d = 227$ mm ◀

$$\omega_n^2 = \frac{\left(\frac{3(0.75)}{2} + 0.22708\right)9.81}{(0.75^2 + 0.22708^2)}$$

$$= 21.6$$

$\omega_n = 4.6476$ rad/s

(*b*) Period of oscillation. $$\tau_n = \frac{2\pi}{\omega_n} = \frac{2\pi}{4.6476}$$

$\tau_n = 1.352$ s ◀

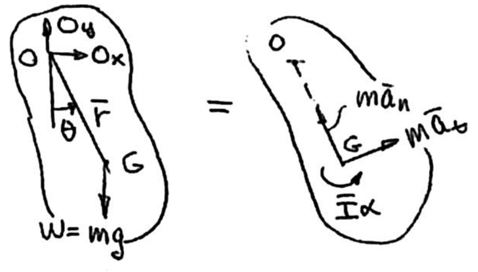
PROBLEM 19.52

A *compound pendulum* is defined as a rigid slab which oscillates about a fixed Point O, called the center of suspension. Show that the period of oscillation of a compound pendulum is equal to the period of a simple pendulum of length OA, where the distance from A to the mass center G is $GA = \bar{k}^2/\bar{r}$. Point A is defined as the center of oscillation and coincides with the center of percussion defined in Problem 17.66.

SOLUTION

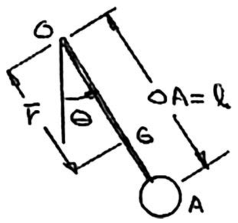


$$+\circlearrowleft \Sigma M_0 = \Sigma(M_0)_{\text{eff}}: \quad -W\bar{r}\sin\theta = \bar{I}\alpha + m\bar{a}_t\bar{r}$$

$$-mg\bar{r}\sin\theta = m\bar{k}^2\ddot{\theta} + m\bar{r}^2\ddot{\theta}$$

$$\ddot{\theta} + \frac{g\bar{r}}{\bar{r}^2 + \bar{k}^2}\sin\theta = 0 \qquad (1)$$

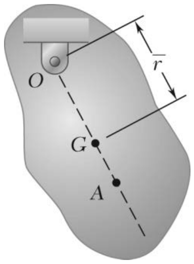
For a simple pendulum of length $OA = l$,



$$\ddot{\theta} + \frac{g}{l}\theta = 0 \qquad (2)$$

Comparing Equations (1) and (2), $\quad l = \dfrac{\bar{r}^2 + \bar{k}^2}{\bar{r}} \qquad GA = l - \bar{r} = \dfrac{\bar{k}^2}{\bar{r}}$ Q.E.D. ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



PROBLEM 19.53

A rigid slab oscillates about a fixed Point O. Show that the smallest period of oscillation occurs when the distance $\bar{r}$ from Point O to the mass center G is equal to $\bar{k}$.

SOLUTION

See Solution to Problem 19.52 for derivation of

$$\ddot{\theta} + \frac{g\bar{r}}{\bar{r}^2 + \bar{k}^2}\sin\theta = 0$$

For small oscillations, $\sin\theta \approx \theta$ and

$$\tau_n = \frac{2\pi}{\omega_n} = 2\pi\sqrt{\frac{\bar{r}^2 + \bar{k}^2}{g\bar{r}}} = \frac{2\pi}{\sqrt{g}}\sqrt{\bar{r} + \frac{\bar{k}^2}{\bar{r}}}$$

For smallest τ_n, we must have $\bar{r} + \frac{\bar{k}^2}{\bar{r}}$ as a minimum:

$$\frac{d\left(\bar{r} + \frac{\bar{k}^2}{\bar{r}}\right)}{d\bar{r}} = 1 - \frac{\bar{k}^2}{\bar{r}^2} = 0$$

$$\bar{r}^2 = \bar{k}^2$$

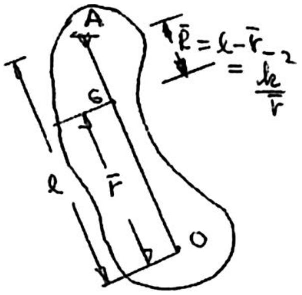
$\bar{r} = \bar{k}$ Q.E.D. ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 19.54

Show that if the compound pendulum of Problem 19.52 is suspended from *A* instead of *O*, the period of oscillation is the same as before and the new center of oscillation is located at *O*.

SOLUTION



Same derivation as in Problem 19.52 with $\bar{r}$ replaced by $\bar{R}$.

Thus, $$\ddot{\theta} + \frac{g\bar{R}}{\bar{R}^2 + \bar{k}}\theta = 0$$

Length of the equivalent simple pendulum is

$$L = \frac{\bar{R}^2 + \bar{k}^2}{\bar{R}} = \bar{R} + \frac{\bar{k}^2}{\bar{R}}$$

$$L = (l - \bar{r}) + \frac{\bar{k}^2}{\frac{\bar{k}^2}{\bar{r}}} = l$$

Thus, the length of the equivalent simple pendulum is the same as in Problem 19.52. It follows that the period is the same and that the new center of oscillation is at *O*. Q.E.D.

PROBLEM 19.55

The 8-kg uniform bar AB is hinged at C and is attached at A to a spring of constant $k = 500$ N/m. If end A is given a small displacement and released, determine (a) the frequency of small oscillations, (b) the smallest value of the spring constant k for which oscillations will occur.

SOLUTION

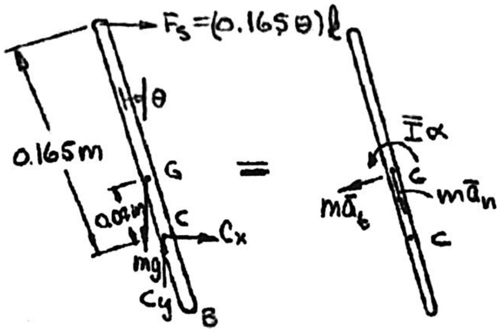
$$\bar{I} = \frac{1}{12}ml^2 = \left(\frac{1}{12}\right)(8)(0.250)^2$$

$$\bar{I} = 0.04167 \text{ kg}\cdot\text{m}^2$$

$$\alpha = \ddot{\theta}$$

$$a_t = 0.04\alpha = 0.04\ddot{\theta}$$

$$\sin\theta \approx \theta$$



Equation of motion.

$$+\circlearrowleft \Sigma M_C = \Sigma(M_C)_{\text{eff}}: \quad -(0.165)^2 k\theta + 0.04mg\theta = \bar{I}\ddot{\theta} + (0.04)^2 m\ddot{\theta}$$

$$(0.04167 + 0.01280)\ddot{\theta} + (0.02722k - 0.32g)\theta = 0 \qquad (1)$$

(a) Frequency if $k = 500$ N · m.

$$0.05447\ddot{\theta} + (10.47)\theta = 0$$

$$f_n = \frac{\omega_n}{2\pi} = \frac{\left(\sqrt{\frac{10.47}{0.05447}}\right)}{2\pi}$$

$f_n = 2.21$ Hz ◀

(b) For $\tau_n \longrightarrow \infty$ or $\omega_n \longrightarrow 0$, oscillations will not occur.

From Equation (1),

$$\omega_n^2 = \frac{0.02722k - 0.32g}{(0.05447)} = 0$$

$$k = \frac{0.32g}{0.02722} = \frac{(0.32)(9.81)}{(0.02722)}$$

$k = 115.3$ N/m ◀

All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 19.58

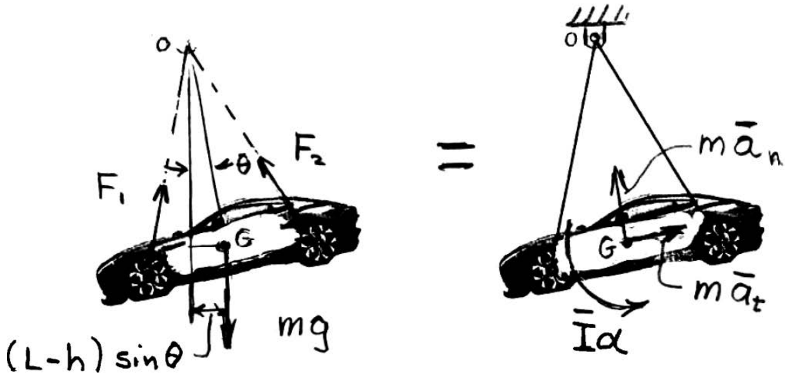
A 1300-kg sports car has a center of gravity G located a distance h above a line connecting the front and rear axles. The car is suspended from cables that are attached to the front and rear axles as shown. Knowing that the periods of oscillation are 4.04 s when $L = 4$ m and 3.54 s when $L = 3$ m, determine h and the centroidal radius of gyration.

SOLUTION

Let the mass center of the car be displaced a small distance x to the right. The mass center is moves on a circular arc of radius $L - h$, so that $x = (L - h)\sin\theta$, where θ is the counterclockwise rotation of the car. From kinematics

$$\alpha = \ddot{\theta} \qquad \bar{a}_t = (L-h)\ddot{\theta}$$

The moment of the weight force about O is



$$M_0 = -mg(L-h)\sin\theta$$

$$+\circlearrowleft M_0 = \bar{I}\alpha + (L-h)m\bar{a}_t$$

$$-mg(L-h)\sin\theta = \bar{I}\ddot{\theta} + m(L-h)^2\ddot{\theta}$$

Dividing by m and transposing terms yields

$$[\bar{k}^2 + (L-h)^2]\ddot{\theta} + g(L-h)\sin\theta = 0$$

For small angle θ, $\quad \sin\theta \approx \theta$

$$\ddot{\theta} + \frac{g(L-h)}{\bar{k}^2 + (L-h)^2}\theta = 0$$

$$\ddot{\theta} + \omega_n^2\theta = 0 \qquad \omega_n^2 = \frac{g(L-h)}{\bar{k}^2 + (L-h)^2}$$

$$\bar{k}^2 + (L-h)^2 = \frac{g}{\omega_n^2}(L-h)$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

Using the two different values (L_1 and L_2) for L,

$$\bar{k}^2 + (L_1 - h)^2 = \frac{g}{\omega_{n1}^2}(L_1 - h) \qquad (1)$$

$$\bar{k}^2 + (L_2 - h)^2 = \frac{g}{\omega_{n2}^2}(L_2 - h) \qquad (2)$$

Subtracting Eq. (2) from Eq. (1) to eliminate $\bar{k}^2$,

$$(L_1 - h)^2 - (L_2 - h)^2 = \frac{gL_1}{\omega_{n1}^2} - \frac{gL_2}{\omega_{n2}^2} - \left(\frac{g}{\omega_{n1}^2} - \frac{g}{\omega_{n2}^2}\right)h$$

$$\left(L_1^2 - L_2^2\right) - 2(L_1 - L_2)h = A - Bh$$

where $$A = \frac{gL_1}{\omega_{n1}^2} - \frac{gL_2}{\omega_{n2}^2}$$

and $$B = \frac{g}{\omega_{n1}^2} - \frac{g}{\omega_{n2}^2}$$

$$h = \frac{L_1^2 - L_2^2 - A}{2(L_1 - L_2) - B}$$

Data: $L_1 = 4$ m, $L_2 = 3$ m, $g = 9.81 \text{ m/s}^2$

$$\omega_{n1} = \frac{2\pi}{\tau_1} = \frac{2\pi}{4.04 \text{ s}} = 1.55524 \text{ rad/s}$$

$$\omega_{n2} = \frac{2\pi}{\tau_2} = \frac{2\pi}{3.54 \text{ s}} = 1.77491 \text{ rad/s}$$

$$A = \frac{(9.81)(4)}{(1.55524)^2} - \frac{(9.81)(3)}{(1.77491)^2} = 6.8812 \text{ m}^2$$

$$B = \frac{9.81}{(1.55524)^2} - \frac{9.81}{(1.77491)^2} = 0.94190 \text{ m}$$

$$h = \frac{(4)^2 - (3)^2 - 6.8812}{2(4-3) - 0.94190} = 0.11228 \text{ m}$$

$h = 0.1123$ m ◀

$$L_1 - h = 3.88772 \text{ m} \qquad L_2 - h = 2.88772 \text{ m}$$

From Eq. (1), $$\bar{k}^2 + (3.88772)^2 = \frac{(9.81)(3.88772)}{(1.55524)^2}$$

$$\bar{k}^2 = 0.65336 \text{ m}^2$$

$\bar{k} = 0.808$ m ◀

Checking, using Eq. (2), $$\bar{k}^2 + (2.88772)^2 = \frac{(9.81)(2.88772)}{(1.77491)^2}$$

$$\bar{k}^2 = 0.65339 \text{ m}^2$$

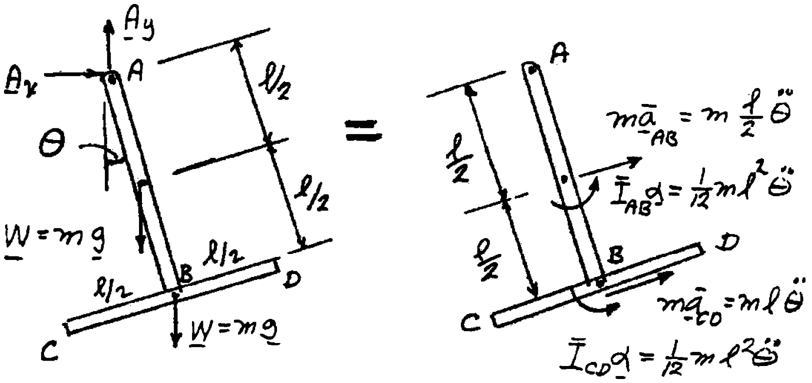
PROBLEM 19.61

Two uniform rods, each of mass m and length l, are welded together to form the T-shaped assembly shown. Determine the frequency of small oscillations of the assembly.

SOLUTION

Let the assembly be rotated counterclockwise through the small angle θ about the fixed Point A.



Equation of motion. $\circlearrowleft + \Sigma M_A = \Sigma(M_A)_{\text{eff}}: \quad -mg\dfrac{l}{2}\sin\theta - mgl\sin\theta = \bar{I}_{AB}\alpha + m\bar{a}_{AB}\dfrac{l}{2} + \bar{I}_{CD}\alpha + m\bar{a}_{CD}l$

$$-\frac{3}{2}mgl\sin\theta = \frac{1}{12}ml^2\ddot{\theta} + m\left(\frac{l}{2}\right)^2\ddot{\theta} + \frac{1}{12}ml^2\ddot{\theta} + ml^2\ddot{\theta}$$

$$-\frac{3}{2}mgl\sin\theta = \frac{17}{12}ml^2\ddot{\theta}$$

$$\ddot{\theta} + \frac{18}{17}\frac{g}{l}\sin\theta = 0$$

For small oscillations, $\sin\theta \approx \theta$

$$\ddot{\theta} + \frac{18}{17}\frac{g}{l}\theta = 0$$

$$\omega_n^2 = \frac{18}{17}\frac{g}{l} \qquad \omega_n = \sqrt{\frac{18g}{17l}}$$

Frequency. $f = \dfrac{\omega_n}{2\pi} \quad f = \dfrac{1}{2\pi}\sqrt{\dfrac{18g}{17l}}$ $\qquad f = 0.1638\sqrt{\dfrac{g}{l}}$ ◀

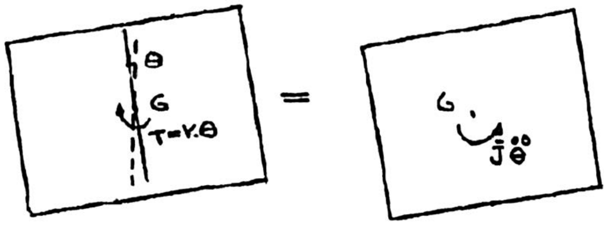
PROBLEM 19.63

A horizontal platform P is held by several rigid bars which are connected to a vertical wire. The period of oscillation of the platform is found to be 2.2 s when the platform is empty and 3.8 s when an object A of unknown moment of inertia is placed on the platform with its mass center directly above the center of the plate. Knowing that the wire has a torsional constant $K = 27\ \text{N}\cdot\text{m/rad}$, determine the centroidal moment of inertia of object A.

SOLUTION



Equation of motion. $\Sigma M_G = \bar{I}\alpha: \quad -K\theta = \bar{I}\ddot{\theta}$

$$\ddot{\theta} + \frac{K}{\bar{I}}\theta = 0 \qquad \omega_n^2 = \frac{K}{\bar{I}}$$

Case 1. The platform is empty.

$$\omega_{n1} = \frac{2\pi}{\tau_1} = \frac{2\pi}{2.2} = 2.856 \text{ rad/s}$$

$$\bar{I}_1 = \frac{K}{\omega_{n1}^2} = \frac{27}{(2.856)^2} = 3.31 \text{ kg}\cdot\text{m}^2$$

Case 2. Object A is on the platform.

$$\omega_{n2} = \frac{2\pi}{\tau_2} = \frac{2\pi}{3.8} = 1.653 \text{ rad/s}$$

$$\bar{I}_2 = \frac{K}{\omega_{n2}^2} = \frac{27}{(1.653)^2} = 9.8814 \text{ kg}\cdot\text{m}^2$$

Moment of inertia of object A. $\bar{I}_A = \bar{I}_2 - \bar{I}_1$

$$\bar{I}_A = 6.57 \text{ kg}\cdot\text{m}^2 \blacktriangleleft$$

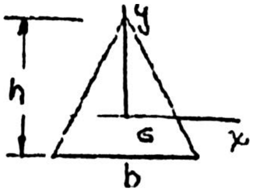
 	**PROBLEM 19.66** A 1.8-kg uniform plate in the shape of an equilateral triangle is suspended at its center of gravity from a steel wire which is known to have a torsional constant $K = 35\ \text{mN}\cdot\text{m/rad}$. If the plate is rotated 360° about the vertical and then released, determine (*a*) the period of oscillation, (*b*) the maximum velocity of one of the vertices of the triangle.

SOLUTION

Mass moment of inertia of plate about a vertical axis:



$$h = \frac{\sqrt{3}}{2}b \qquad A = \frac{1}{2}bh = \frac{\sqrt{3}}{4}b^2$$

For area,

$$\bar{I}_x = \bar{I}_y = \frac{1}{36}bh^3 = \frac{\sqrt{3}b^4}{96}$$

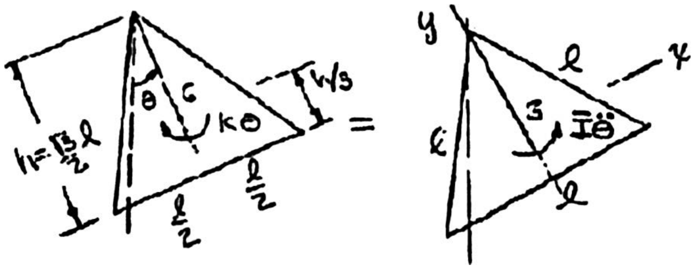
$$\bar{I}_z = \bar{I}_x + \bar{I}_y = \frac{\sqrt{3}}{48}b^4$$

For mass,

$$\bar{I} = \frac{m}{A}(\bar{I}_z)_{\text{area}}$$

$$= \left(\frac{4\,m}{\sqrt{3}b}\right)\left(\frac{\sqrt{3}}{48}b^4\right) = \frac{1}{12}mb^2$$

$$\bar{I} = \frac{1}{12}(1.8)(0.150)^2 = 3.375\times10^{-3}\ \text{kg}\cdot\text{m}^2$$



Equation of motion. $\quad +\ \Sigma M_G = \Sigma(M_G)_{\text{eff}}: \quad -K\theta = \bar{I}\ddot{\theta}$

$$\ddot{\theta} + \frac{K}{\bar{I}}\theta = 0$$

Frequency.

$$\omega_n^2 = \frac{K}{\bar{I}} = \frac{35\times10^{-3}}{3.375\times10^{-3}} = 10.37$$

$$\omega_n = 3.2203\ \text{rad/s}$$

PROBLEM 19.68

The centroidal radius of gyration $\bar{k}_y$ of an airplane is determined by suspending the airplane by two 12-ft-long cables as shown. The airplane is rotated through a small angle about the vertical through G and then released. Knowing that the observed period of oscillation is 3.3 s, determine the centroidal radius of gyration $\bar{k}_y$.

SOLUTION

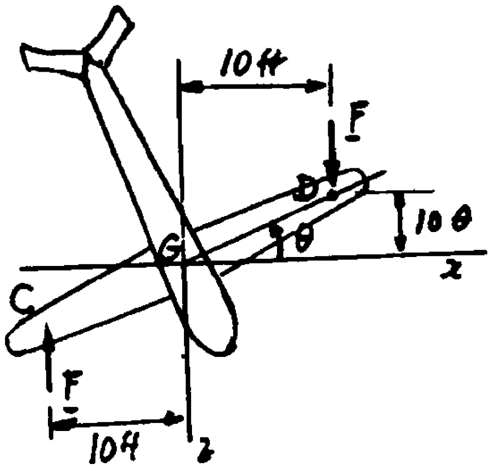
Let the airplane rotate through the small angle θ about a vertical axis. Suspension Points C and D on the airplane each move horizontally a distance (10 ft) sin $\theta \approx$ (10 ft) θ. Let φ be the angle between a cable and the vertical direction. Then, $\sin\varphi = (10\text{ ft})\theta/(12\text{ ft}) = \frac{5}{6}\theta.$

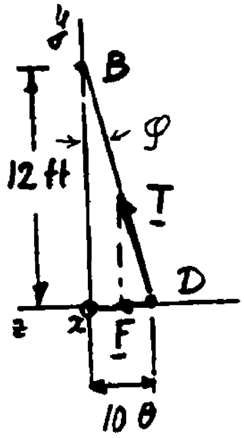
$$+\uparrow \Sigma F = 0: \quad 2T\cos\varphi - W = 0$$

$$T = \frac{W}{2\cos\varphi} \approx \frac{W}{2}$$

Let F be the horizontal component of T.

$$F = T\sin\varphi \approx \frac{W}{2}\cdot\frac{5}{6}\theta = \frac{5}{12}W\theta$$





The two forces F form a couple of moment

$$M = -(20\text{ ft})F = -(20)\left(\frac{5}{12}\right)W\theta$$

Equation of motion:

$$+\circlearrowleft \Sigma M_y = \bar{I}_y\alpha: \quad -20\left(\frac{5W}{12}\theta\right) = \frac{W}{g}\bar{k}_y^2\ddot{\theta}$$

$$\ddot{\theta} + \frac{(20)(5)g}{12\bar{k}_y^2}\theta = 0$$

PROBLEM 19.70

Two blocks, each of weight 3 lb, are attached to links which are pin-connected to bar *BC* as shown. The weights of the links and bar are negligible, and the blocks can slide without friction. Block *D* is attached to a spring of constant $k = 4$ lb/in. Knowing that block *A* is moved 0.5 in. from its equilibrium position and released, determine the magnitude of the maximum velocity of block *D* during the resulting motion.

SOLUTION

$$T = \frac{1}{2}m(b^2 + c^2)\dot{\theta}^2$$

$$V = \frac{1}{2}kc^2\theta^2$$

$$\omega_n^2 = \frac{kc^2}{m(b^2 + c^2)}$$

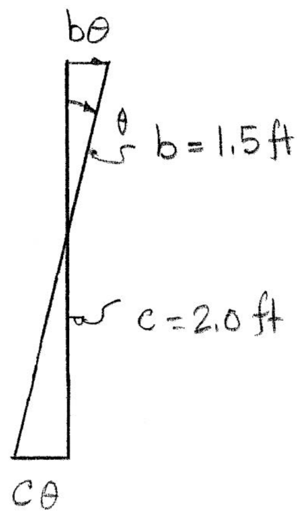
$$k = 48 \text{ lb/ft}$$

$$m = \frac{3 \text{ lb}}{32.2 \text{ ft/s}^2} = 0.093167 \text{ lb} \cdot \text{s}^2/\text{ft}$$

$$\omega_n^2 = \frac{(48)(2)^2}{(0.093167)(1.5^2 + 2^2)} = 329.73$$

$$\omega_n = 18.158 \text{ rad/s}$$

$$\theta_0 = \frac{\frac{0.5 \text{ in.}}{12 \text{ in./ft}}}{1.5 \text{ ft}} = 0.0277 \text{ rad}$$



$$|v_D|_m = c\omega_n\theta_0$$

$$= (2)(18.158)(0.02778) = 1.009 \text{ ft}$$

$|v_D|_m = 12.11$ in./s ◀

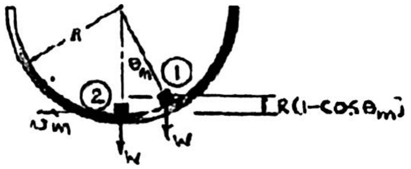
PROBLEM 19.72

Determine the period of small oscillations of a small particle which moves without friction inside a cylindrical surface of radius *R*.

SOLUTION



Datum at ②:

Position ①

$$T_1 = 0$$

$$V_1 = WR(1-\cos\theta_m)$$

Small oscillations:

$$(1-\cos\theta_m) = 2\sin^2\frac{\theta_m}{2} \approx \frac{\theta_m^2}{2}$$

$$V_1 = \frac{WR\theta_m^2}{2}$$

Position ②

$$v_m = R\dot{\theta}_m \quad T_2 = \frac{1}{2}mv_m^2 = \frac{1}{2}mR^2\dot{\theta}_m^2$$

$$V_2 = 0$$

Conservation of energy. $T_1 + Y_1 = T_2 + V_2$

$$0 + WR\frac{\theta_m^2}{2} = \frac{1}{2}mR^2\dot{\theta}_m^2 + 0 \qquad \dot{\theta}_m = \omega_n\theta_m$$

$$W = mg$$

$$mgR\frac{\theta_m^2}{2} = \frac{1}{2}mR^2\omega_n^2\theta_m^2$$

$$\omega_n = \sqrt{\frac{g}{R}}$$

Period of oscillations. $$\tau_n = \frac{2\pi}{\omega_n} = 2\pi\sqrt{\frac{R}{g}} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 19.75

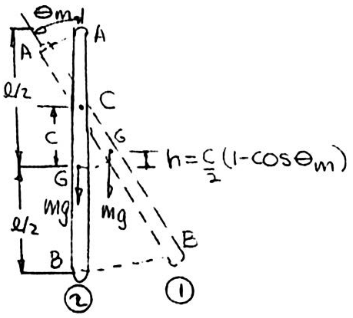
A uniform rod AB can rotate in a vertical plane about a horizontal axis at C located at a distance c above the mass center G of the rod. For small oscillations, determine the value of c for which the frequency of the motion will be maximum.

SOLUTION



Find ω_n as a function of c.

Datum at ②:

Position ①

$$T_1 = 0 \qquad V_1 = mgh$$

$$V_1 = mgc(1-\cos\theta_m)$$

$$1-\cos\theta_m = 2\sin^2\frac{\theta_m}{2} \approx \frac{\theta_m^2}{2}$$

$$V_1 = mgc\frac{\theta_m^2}{2}$$

Position ②

$$T_2 = \frac{1}{2}I_C\dot{\theta}_m^2$$

$$I_C = \overline{I} + mc^2 = \frac{1}{12}ml^2 + mc^2$$

$$T_2 = \frac{1}{2}m\left(\frac{l^2}{12}+c^2\right)\dot{\theta}_m^2 \qquad V_2 = 0$$

$$T_1 + V_1 = T_2 + V_2 \quad 0 + mgc\frac{\theta_m^2}{2} = m\left(\frac{l^2}{12}+c^2\right)\frac{\dot{\theta}_m^2}{2} + 0$$

$$\dot{\theta}_m = \omega_n\theta_m$$

$$gc = m\left(\frac{l^2}{12}+c^2\right)\omega_n^2$$

$$\omega_n^2 = \frac{gc}{\left(\frac{l^2}{12}+c^2\right)}$$

Maximum c, when

$$\frac{d\omega_n^2}{dc} = 0 = \frac{g\left(\frac{l^2}{12}+c^2\right) - 2c^2 g}{\left(\frac{l^2}{12}+c^2\right)} = 0$$

$$\frac{l^2}{12} - c^2 = 0 \qquad\qquad c = \frac{l}{\sqrt{12}} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. PROBLEM 19.76

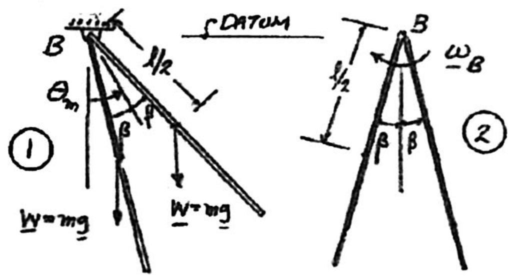
A homogeneous wire of length $2l$ is bent as shown and allowed to oscillate about a frictionless pin at B. Denoting by τ_0 the period of small oscillations when $\beta = 0$, determine the angle β for which the period of small oscillations is $2\tau_0$.

SOLUTION

We denote by m the mass of half the wire.



Position ① Maximum deflections:

$$T_1 = 0, \quad V_1 = -mg\frac{l}{2}\cos(\theta_m - \beta) - mg\frac{l}{2}\cos(\theta_m + \beta)$$

$$= -mg\frac{l}{2}(\cos\theta_m \cos\beta + \sin\theta_m \sin\beta + \cos\theta_m \cos\beta - \sin\theta_m \sin\beta)$$

$$V_1 = -mgl\cos\beta\cos\theta_m$$

For small oscillations, $\cos\theta_m \approx 1 - \frac{1}{2}\theta_m^2$

$$V_1 = -mgl\cos\beta + \frac{1}{2}mgl\cos\beta\,\theta_m^2$$

Position ② Maximum velocity:

$$T_2 = \frac{1}{2}I_B\dot{\theta}_m^2 \quad \text{but} \quad I_B = 2\left(\frac{1}{3}ml^2\right)$$

Thus, $T_2 = \frac{1}{2}\left(\frac{2}{3}ml^2\right)\dot{\theta}_m^2$

$$V_2 = -2mg\left(\frac{l}{2}\cos\beta\right) = -mgl\cos\beta$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

Conservation of energy. $T_1 + V_1 = T_2 + V_2$

$$-mgl\cos\beta + \frac{1}{2}mgl\cos\beta\,\theta_m^2 = \frac{1}{3}ml^2\dot{\theta}_m^2 - mgl\cos\beta$$

Setting $\dot{\theta}_m = \theta_m\omega_n$, $\frac{1}{2}mgl\cos\beta\,\theta_m^2 = \frac{1}{3}ml^2\,\theta_m^2\omega_n^2$

$$\omega_n^2 = \frac{3}{2}\frac{g}{l}\cos\beta \qquad \tau = \frac{2\pi}{\omega_n} = 2\pi\sqrt{\frac{2l}{3g\cos\beta}} \qquad (1)$$

But for $\beta = 0$, $\tau_0 = 2\pi\sqrt{\frac{2l}{3g}}$

For $\tau = 2\tau_0$, $2\pi\sqrt{\frac{2l}{3g\cos\beta}} = 2\left(2\pi\sqrt{\frac{2l}{3g}}\right)$

Squaring and reducing,

$$\frac{1}{\cos\beta} = 4 \qquad \cos\beta = \frac{1}{4}$$

$\beta = 75.5°$ ◀

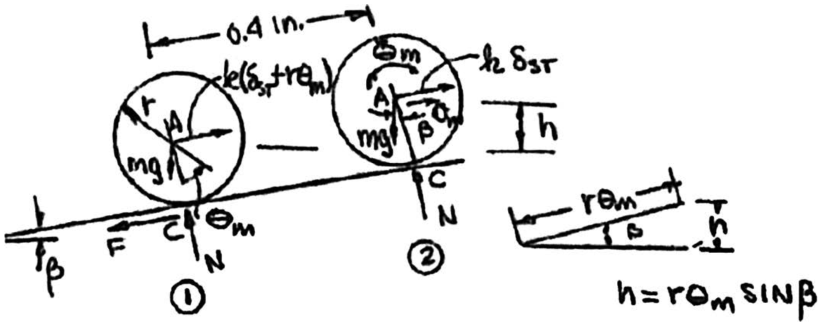
PROBLEM 19.79

A 15-lb uniform cylinder can roll without sliding on an incline and is attached to a spring *AB* as shown. If the center of the cylinder is moved 0.4 in. down the incline and released, determine (*a*) the period of vibration, (*b*) the maximum velocity of the center of the cylinder.

SOLUTION



(*a*) Position ①

$$T_1 = 0 \quad V_1 = \frac{1}{2}k(\delta_{\text{st}} + r\theta_m)^2$$

Position ②

$$T_2 = \frac{1}{2}\bar{I}\dot{\theta}_m^2 + \frac{1}{2}m\bar{v}_m^2$$

$$V_2 = mgh + \frac{1}{2}k(\delta_{\text{st}})^2$$

Conservation of energy.

$$T_1 + V_1 = T_2 + V_2: \quad 0 + \frac{1}{2}k(\delta_{\text{st}} + r\theta_m)^2 = \frac{1}{2}\bar{I}\dot{\theta}_m^2 + \frac{1}{2}m\bar{v}_m^2 + mgh + \frac{1}{2}k(\delta_{\text{st}})^2$$

$$k\delta_{\text{st}}^2 + 2k\delta_{\text{st}}r\theta_m + kr^2\theta_m^2 = \bar{I}\dot{\theta}_m^2 + mv_m^2 + 2mgh + k\delta_{\text{st}}^2 \qquad (1)$$

When the disk is in equilibrium,

$$\circlearrowleft + \Sigma M_c = 0 = mg\sin\beta r - k\delta_{\text{st}}r$$

Also,

$$h = r\sin\beta\,\theta_m$$

Thus,

$$mgh - k\delta_{\text{st}}r = 0 \qquad (2)$$

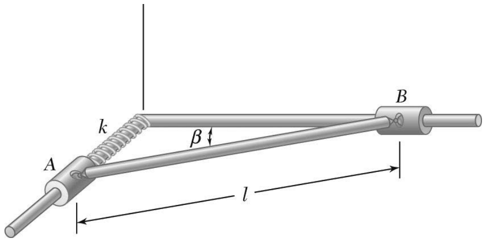
PROBLEM 19.81

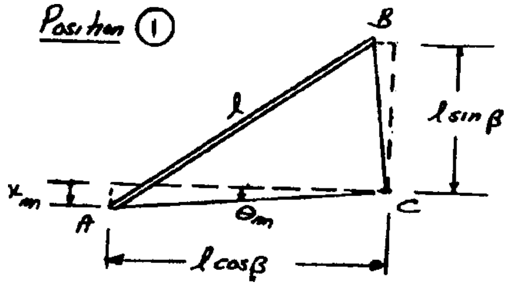


A slender rod *AB* of mass *m* and length *l* is connected to two collars of negligible mass in a horizontal plane as shown. Collar *A* is attached to a spring of constant *k*. Knowing that the collars can slide freely on their respective rods and the system is in equilibrium in the position shown, determine the period of vibration if collar *A* is given a small displacement and released.

SOLUTION

Moment of inertia: $\bar{I} = \frac{1}{12}ml^2$

Position ① Maximum deflection: Let collar *A* be moved a small distance x_m as shown. Since the movement is horizontal, there is no change in gravitational potential energy.



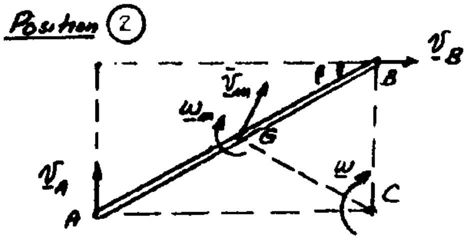
$$x_m = (l\cos\beta)\theta_m$$

$$V_1 = \frac{1}{2}kx_m^2 = \frac{1}{2}k(l\cos\beta\theta_m)^2$$

$$V_1 = \frac{1}{2}kl^2\cos^2\beta\theta_m^2$$

$$T_1 = 0$$

Position ② Maximum velocity: The instantaneous center of rotation lies at Point *C*, the intersection of lines perpendicular, respectively, to $\mathbf{v}_A$ and $\mathbf{v}_B$.



$$\bar{v}_m = (GC)\omega_m = \frac{1}{2}l\omega_m$$

$$T_2 = \frac{1}{2}m\bar{v}_m^2 + \frac{1}{2}\bar{I}\,\omega_m^2$$

$$= \frac{1}{2}m\left(\frac{1}{2}l\omega_m\right)^2 + \frac{1}{2}\left(\frac{1}{12}ml^2\right)\omega_m^2$$

$$T_2 = \frac{1}{6}ml^2\omega_m^2$$

But, $\omega_m = -\dot{\theta}_m$

so that

$$T_2 = \frac{1}{6}ml^2\dot{\theta}_m^2$$

$$V_2 = 0$$

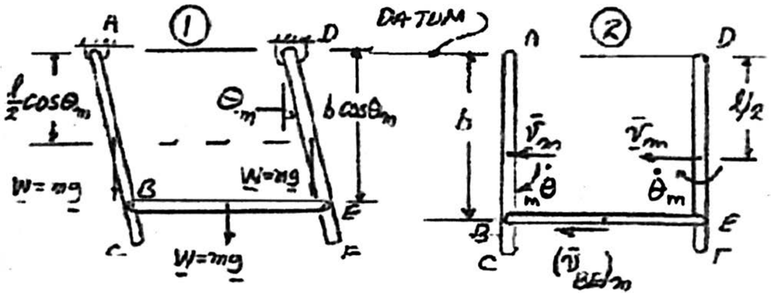
PROBLEM 19.84

Three identical rods are connected as shown. If $b = \frac{3}{4}l$, determine the frequency of small oscillations of the system.

SOLUTION

$l =$ length of each rod

$m =$ mass of each rod



Kinematics:

$$\bar{v}_m = \frac{l}{2}\dot{\theta}_m$$

$$(\bar{v}_{BE})_m = b\dot{\theta}_m$$

Position ①

$$T_1 = 0$$

$$V_1 = -2mg\frac{l}{2}\cos\theta_m - mgb\cos\theta_m$$

$$V_1 = -mg(l+b)\cos\theta_m$$

Position ②

$$V_2 = -2mg\frac{l}{2} - mgb$$

$$= -mg(l+b)$$

$$T_2 = 2\left[\frac{1}{2}\bar{I}\dot{\theta}_m^2 + \frac{1}{2}m\bar{v}_m^2\right] + \frac{1}{2}m(\bar{v}_{BE})_m^2$$

$$= \frac{1}{12}ml^2\dot{\theta}_m^2 + m\left(\frac{l}{2}\dot{\theta}_m\right)^2 + \frac{1}{2}m(b\dot{\theta}_m)^2$$

$$T_2 = \left(\frac{1}{3}l^2 + \frac{1}{2}b^2\right)m\dot{\theta}_m^2$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 19.84 (Continued)

Conservation of energy. $T_1 + V_1 = T_2 + V_2$: $0 - mg(l+b)\cos\theta_m = \left(\frac{1}{3}l^2 + \frac{1}{2}b^2\right)m\dot{\theta}_m^2 - mg(l+b)$

$$mg(l+b)(1-\cos\theta_m) = \left(\frac{1}{3}l^2 + \frac{1}{2}b^2\right)m\dot{\theta}_m^2$$

For small oscillations, $(1-\cos\theta_m) = \frac{1}{2}\theta_m^2$

$$\frac{1}{2}mg(l+b)\theta_m^2 = \left(\frac{1}{3}l^2 + \frac{1}{2}b^2\right)m\dot{\theta}_m^2$$

But for simple harmonic motion, $\dot{\theta}_m = \omega_n\theta_m$: $\frac{1}{2}mg(l+b)\theta_m^2 = \left(\frac{1}{3}l^2 + \frac{1}{2}b^2\right)m(\omega_n\theta_m)^2$

$$\omega_n^2 = \frac{1}{2}g\frac{l+b}{\frac{1}{3}l^2 + \frac{1}{2}b^2}$$

or

$$\omega_n^2 = 3g\frac{l+b}{2l^2 + 3b^2} \qquad (1)$$

For $b = \frac{3}{4}l$, we have

$$\omega_n^2 = 3g\frac{l + \frac{3}{4}l}{2l^2 + 3\left(\frac{3}{4}l\right)^2}$$

$$= 3g\frac{\frac{7}{4}l}{\frac{59}{16}l^2}$$

$$= 1.4237\frac{g}{l}$$

$$\omega_n = 1.1932\sqrt{\frac{g}{l}}$$

$$f_n = \frac{\omega_n}{2\pi}$$

$$= \frac{1.1932}{2\pi}\sqrt{\frac{g}{l}}$$

$f_n = 0.1899\sqrt{\frac{g}{l}}$ ◀

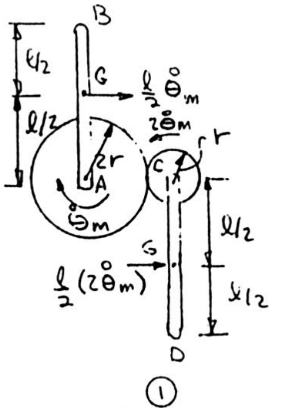
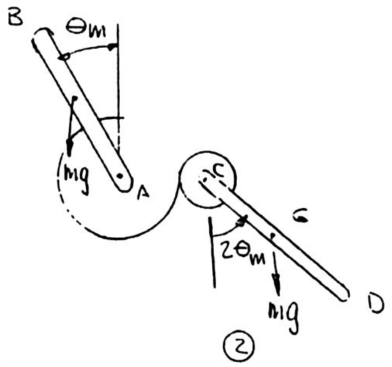
PROBLEM 19.88

Two uniform rods AB and CD, each of length l and mass m, are attached to gears as shown. Knowing that the mass of gear C is m and that the mass of gear A is $4m$, determine the period of small oscillations of the system.

SOLUTION





Kinematics: $2r\theta_A = r\theta_C \qquad 2\theta_A = \theta_C$

$$2\dot{\theta}_A = \dot{\theta}_C$$

Let $\theta_A = \theta_m \qquad 2\theta_m = (\theta_C)_m$

$$2\dot{\theta}_m = (\dot{\theta}_C)_m$$

<u>*Position* ①</u>

$$T_1 = \frac{1}{2}\bar{I}_A\dot{\theta}_m^2 + \frac{1}{2}\bar{I}_C(2\dot{\theta}_m)^2 + \frac{1}{2}\bar{I}_{AB}\dot{\theta}_m^2 + \frac{1}{2}\bar{I}_{CD}(2\dot{\theta}_m)^2 + \frac{1}{2}m_{AB}\left(\frac{l}{2}\dot{\theta}_m\right)^2 + \frac{1}{2}m_{CD}\left(\frac{l}{2}2\dot{\theta}_m\right)^2$$

$$\bar{I}_A = \frac{1}{2}(4m)(2r)^2 = 8mr^2$$

$$\bar{I}_C = \frac{1}{2}(m)(r^2) = \frac{1}{2}mr^2$$

$$\bar{I}_{AB} = \frac{1}{12}ml^2 \qquad \bar{I}_{CD} = \frac{1}{12}ml^2$$

$$T_1 = \frac{1}{2}m\left[8r^2 + \left(\frac{r^2}{2}\right)4 + \frac{l^2}{12} + \frac{l^2}{3} + \frac{l^2}{4} + l^2\right]\dot{\theta}_m^2$$

$$T_1 = \frac{1}{2}m\left[10r^2 + \frac{5}{3}l^2\right]\dot{\theta}_m^2 \qquad V_1 = 0$$

PROBLEM 19.89

An inverted pendulum consisting of a rigid bar *ABC* of length *l* and mass *m* is supported by a pin and bracket at *C*. A spring of constant *k* is attached to the bar at *B* and is undeformed when the bar is in the vertical position shown. Determine (*a*) the frequency of small oscillations, (*b*) the smallest value of *a* for which these oscillations will occur.

SOLUTION

Moment of inertia: $\bar{I} = \frac{1}{12}ml^2$

Position ① Maximum deflection. Let rod *AC* rotate through angle θ_m. The spring stretches an amount

$$x_m = a\sin\theta_m$$

and the center of gravity moves down an amount

$$-y_m = \frac{l}{2}(1-\cos\theta_m)$$

$$V_1 = \frac{1}{2}kx_m^2 + mgy_m$$

$$= \frac{1}{2}k(a\sin\theta_m)^2 - mg\frac{l}{2}(1-\cos\theta_m)$$

$$\approx \frac{1}{2}ka^2\theta_m^2 - mg\left(\frac{l}{2}\right)\left(\frac{1}{2}\theta_m^2\right)$$

$$= \frac{1}{2}\left(ka^2 - \frac{1}{2}mgl\right)\theta_m^2$$

$$T_1 = 0$$

Position ② Maximum velocity:

For simple harmonic motion, $\dot{\theta} = -\omega_n\theta_m$

Velocity of the mass center of the rod: $\bar{v} = \frac{l}{2}\dot{\theta}$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 19.89 (Continued)

Kinetic energy:

$$T_2 = \frac{1}{2}m\bar{v}^2 + \frac{1}{2}\bar{I}\dot{\theta}^2$$

$$= \frac{1}{2}\left[m\left(\frac{l\dot{\theta}}{2}\right)^2 + \frac{1}{12}ml^2\dot{\theta}^2\right]$$

$$= \frac{1}{2}\left[\frac{1}{3}ml^2\dot{\theta}^2\right]$$

$$= \frac{1}{2}\left(\frac{1}{3}ml^2\omega_n^2\theta_m^2\right)$$

$$V_2 = 0$$

Conservation of energy:

$$T_1 + V_1 = T_2 + V_2$$

$$0 + \frac{1}{2}\left(ka^2 - \frac{1}{2}mgl\right)\theta_m^2 = \frac{1}{2}\left(\frac{1}{3}ml^2\omega_n^2\theta_m^2\right)$$

$$\omega_n^2 = \frac{6\,ka^2 - 3mgl}{2ml^2}$$

(*a*) Frequency:

$$f = 2\pi\omega_n$$

$$f = 2\pi\sqrt{(6ka^2 - 3mgl)/2ml^2} \quad \blacktriangleleft$$

(*b*) Smallest value of *a* for oscillations. *f* is real for $6\,ka^2 > 3mgl$

$$a > \sqrt{\frac{mgl}{2k}} \qquad a_{\min} = \sqrt{\frac{mgl}{2k}} \quad \blacktriangleleft$$

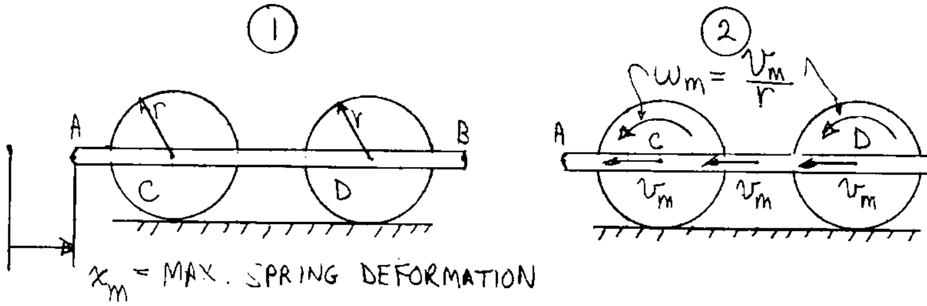
PROBLEM 19.90

Two 12-lb uniform disks are attached to the 20-lb rod AB as shown. Knowing that the constant of the spring is 30 lb/in. and that the disks roll without sliding, determine the frequency of vibration of the system.

SOLUTION



Position 1: $T_1 = 0, \qquad V_1 = \frac{1}{2}kx_m^2$

Position 2: $V_2 = 0, \qquad T_2 = \frac{1}{2}m_{AB}v_m^2 + 2\left(\frac{1}{2}\bar{I}\,\omega_m^2 + \frac{1}{2}m_{\text{disk}}\bar{v}_m^2\right)$

$$T_2 = \frac{1}{2}m_{AB}v_m^2 + \left(\frac{1}{2}m_{\text{disk}}r^2\right)\left(\frac{v_m}{r}\right)^2 + m_{\text{disk}}v_m^2$$

$$T_2 = \frac{1}{2}(m_{AB} + 3m_{\text{disk}})v_m^2$$

Conservation of energy

$$T_1 + V_1 = T_2 + V_2: \qquad 0 + \frac{1}{2}kx_m^2 = \frac{1}{2}(m_{AB} + 3m_{\text{disk}})v_m^2$$

But for simple harmonic motion, $\quad v_m = \omega_n x_m$:

$$\frac{1}{2}kx_m^2 = \frac{1}{2}(m_{AB} + 3m_{\text{disk}})(\omega_n x_m)^2$$

$$\omega_n^2 = \frac{k}{m_{AB} + 3m_{\text{disk}}}$$

Note: Result is independent of r

Data: $k = 30$ lb/in. $\quad W_{AB} = 20$ lb $\quad W_{\text{disk}} = 12$ lb $\quad m_{AB} = \frac{W_{AB}}{g} \quad m_{\text{disk}} = \frac{W_{\text{disk}}}{g}$

$$\omega_n^2 = \frac{30(12)\text{ lb/ft}}{20\text{ lb}/32.2 + 3(12/32.2)} = 207 \qquad \omega_n = 14.387\text{ rad/s}$$

$$f = \frac{\omega_n}{2\pi} = \frac{14.387\text{ rad/s}}{2\pi}$$

$f = 2.29$ Hz ◀

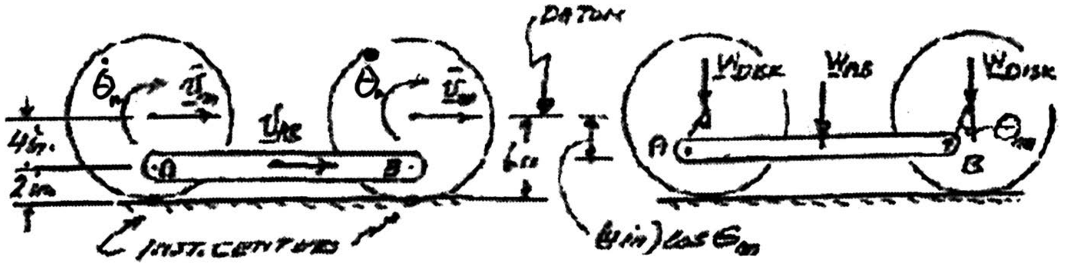
PROBLEM 19.91

The 20-lb rod AB is attached to two 8-lb disks as shown. Knowing that the disks roll without sliding, determine the frequency of small oscillations of the system.

SOLUTION

Position ② *Position* ①

$r = 6\text{ in.}$



Masses and moments of inertia.

$$m_A = m_B = \frac{8}{32.2} = 0.24845\text{ lb}\cdot\text{s}^2/\text{ft}$$

$$\bar{I}_A = \bar{I}_B = \frac{1}{2}m_A r_A^2 = \frac{1}{2}(0.24845)\left(\frac{6}{12}\right)^2$$

$$= 0.031056\text{ lb}\cdot\text{s}\cdot\text{ft}$$

$$m_{AB} = \frac{20}{32.2} = 0.62112\text{ lb}\cdot\text{s}^2/\text{ft}$$

Kinematics:

$$\bar{v}_m = r_A\dot{\theta}_m = \frac{6}{12}\dot{\theta}_m = 0.5\dot{\theta}_m$$

$$v_{AB} = \left(\frac{2}{12}\right)\dot{\theta}_m = \frac{1}{6}\dot{\theta}_m$$

Position ① (Maximum displacement)

$$T_1 = 0$$

$$V_1 = -W_{AB}\left(\frac{4}{12}\cos\theta_m\right) = -\frac{80}{12}\cos\theta_m$$

Position ② (Maximum speed)

$$T_2 = \frac{1}{2}m_A v_m^2 + \frac{1}{2}\bar{I}_A\dot{\theta}_m^2 + \frac{1}{2}m_B v_m^2 + \frac{1}{2}\bar{I}_B\dot{\theta}_m^2 + \frac{1}{2}m_{AB}v_{AB}^2$$

$$= 2\left[\frac{1}{2}(0.24845)(0.5\dot{\theta}_m)^2 + \frac{1}{2}(0.031056)\dot{\theta}_m^2\right] + \frac{1}{2}(0.62112)\left(\frac{1}{6}\dot{\theta}_m\right)^2$$

$$= 0.101795\dot{\theta}_m^2$$

$$V_2 = -W_{AB}\left(\frac{4}{12}\right) = -\frac{80}{12}$$

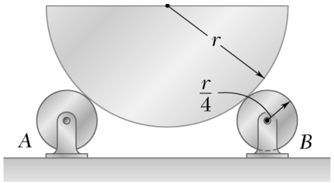
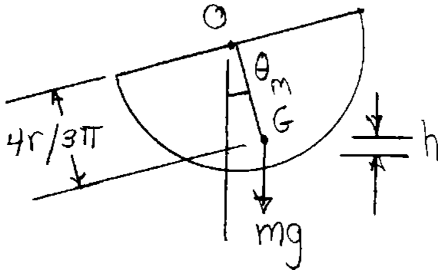
PROBLEM 19.92



A half section of a uniform cylinder of radius r and mass m rests on two casters A and B, each of which is a uniform cylinder of radius $r/4$ and mass $m/8$. Knowing that the half cylinder is rotated through a small angle and released and that no slipping occurs, determine the frequency of small oscillations.

SOLUTION



$$V_1 = mgh = mg\left(\frac{4r}{3\pi}\right)(1-\cos\theta)$$

$$1-\cos\theta \approx \frac{\theta_m^2}{2}$$

$$V_1 = 2mgr\,\frac{\theta_m^2}{3\pi}$$

$$T_2 = \frac{1}{2}I_A\omega_A^2 + \frac{1}{2}I_B\omega_B^2 + \frac{1}{2}\left(\frac{1}{2}mr^2\right)\omega^2$$

Where $\quad I_A = I_B = \frac{1}{2}\left(\frac{m}{8}\right)\left(\frac{r}{4}\right)^2 = \frac{mr^2}{256}$

and $\quad \omega_A = \omega_B = 4\omega$

$$\therefore\ T_2 = \left(\frac{mr^2}{16} + \frac{mr^2}{4}\right)\omega^2 = \frac{5mr^2\omega^2}{16}$$

$$V_1 = T_2, \qquad \frac{2\cancel{m}gr\cancel{\theta_m^2}}{3\pi} = \frac{5\cancel{m}r^2\omega_n^2\cancel{\theta_m^2}}{16}$$

$$\omega_n^2 = \frac{32g}{15\pi r},$$

$$f_n = \left(\frac{1}{2\pi}\right)\sqrt{\frac{32g}{15\pi r}}$$

$$f_n = 0.1312\sqrt{\frac{g}{r}}\ ◀$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 19.93

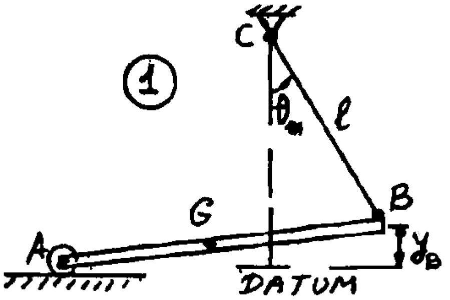
The motion of the uniform rod *AB* is guided by the cord *BC* and by the small roller at *A*. Determine the frequency of oscillation when the end *B* of the rod is given a small horizontal displacement and released.

SOLUTION

Position ①. (Maximum deflection):

Let θ_m be the small angle between the cord *CB* and the vertical. As the rod is moved from the equilibrium position the center of gravity *G* moves up an amount $\bar{y}_m$.



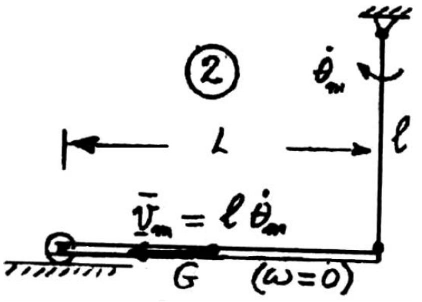
$$y_B = l(1-\cos\theta_m) \approx l\left(1-1+\frac{1}{2}\theta_m^2\right) = \frac{1}{2}l\theta_m^2$$

$$\bar{y}_m = y_G = \frac{1}{2}y_B = \frac{1}{4}l\theta_m^2$$

$$V_1 = mg\bar{y}_m = \frac{1}{4}mgl\theta_m^2$$

$$T_1 = 0,$$

Position ②. (Maximum velocity): At the equilibrium position the motion of the rod is a translation.



$$\bar{v}_m = l\omega = l\dot{\theta}_m$$

$$T_2 = \frac{1}{2}m\bar{v}_m^2 = \frac{1}{2}ml^2\dot{\theta}_m^2$$

$$V_2 = 0$$

Conservation of energy: $T_1 + V_1 = T_2 + V_2$: $\frac{1}{4}mgl\theta_m^2 = \frac{1}{2}ml^2\dot{\theta}_m^2$

For simple harmonic motion; $\dot{\theta}_m = \omega_n\theta_m$ so that

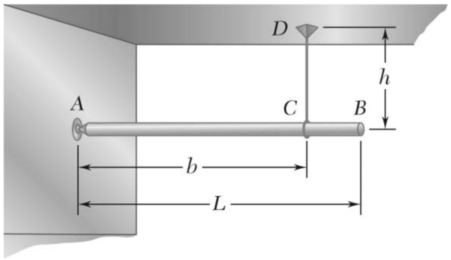
$$\frac{1}{4}mgl\theta_m^2 = \frac{1}{2}ml^2\omega_n^2\theta_m^2$$

Natural frequency: $\omega_n^2 = \frac{g}{2l}$

$$f = \frac{\omega_n}{2\pi} = \frac{1}{2\pi}\sqrt{\frac{g}{2l}}$$

$$f = 0.1125\sqrt{\frac{g}{l}} \quad ◀$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. If you are a student using this Manual, you are using it without permission.*

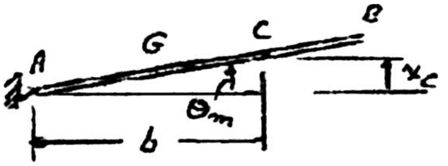


PROBLEM 19.94

A uniform rod of length L is supported by a ball-and-socket joint at A and by a vertical wire CD. Derive an expression for the period of oscillation of the rod if end B is given a small horizontal displacement and then released.

SOLUTION

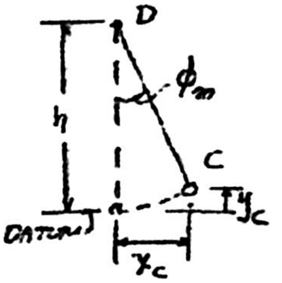
<u>*Position* ①</u> (Maximum deflection)



Looking from above:

Horizontal displacement of C: $x_C = b\theta_m$

Looking from right: $\phi_m = \dfrac{x_C}{h} = \dfrac{b}{h}\theta_m$



$$y_C = h(1-\cos\phi_m) \approx \frac{1}{2}h\phi_m^2$$

$$y_C = \frac{1}{2}h\left(\frac{b}{h}\theta_m\right)^2 = \frac{1}{2}\frac{b^2}{h}\theta_m^2$$

$$\bar{y}_m = y_G = \frac{AG}{AC} - y_C = \frac{\frac{1}{2}L}{b}\left(\frac{1}{2}\frac{b^2}{h}\theta_m^2\right)$$

$$\bar{y}_m = \frac{1}{4}\cdot\frac{bL}{h}\theta_m^2$$

We have $T_1 = 0$

$$V_1 = mgy_m = \frac{1}{4}\frac{mgbL}{h}\theta_m^2$$

<u>*Position* ②</u> (Maximum velocity)

Looking from above: $T_2 = \dfrac{1}{2}\bar{I}\dot{\theta}_m^2 + \dfrac{1}{2}m\bar{v}_m^2$

$$= \frac{1}{2}\left(\frac{1}{12}mL^2\right)\dot{\theta}_m^2 + \frac{1}{2}m\left(\frac{L}{2}\dot{\theta}\right)^2$$

$$T_2 = \frac{1}{6}mL^2\dot{\theta}_m^2$$

$$V_2 = 0$$

<u>Conservation of energy</u>. $T_1 + V_1 = T_2 + V_2$: $\quad 0 + \dfrac{1}{4}\dfrac{mgbL}{h}\theta_m^2 = \dfrac{1}{6}mL^2\dot{\theta}_m^2$

If you are a student using this Manual, you are using it without permission.*

Potential energy:

$$V = W_C y_C + W_{BC}\bar{y}_{BC} + W_{BA}\bar{y}_{BA} + \frac{1}{2}k_A x_A^2 + \frac{1}{2}k_B x_B^2$$

$$= W_C l_{BC}\sin\theta + W_{BC}\left(\frac{1}{2}l_{BC}\sin\theta\right) - W_{BA}\left[\frac{1}{2}l_{BA}(1-\cos\theta)\right]$$

$$+\frac{1}{2}k_A(l_{BA}\sin\theta+\delta_A)^2 + \frac{1}{2}k_C(l_{BC}\sin\theta+\delta_C)^2$$

$$= W_C l_{BC}\sin\theta + \frac{1}{2}W_{BC}l_{BC}\sin\theta - \frac{1}{2}W_{BA}l_{BA}(1-\cos\theta)$$

$$+\frac{1}{2}k_A l_{BA}^2\sin^2\theta + k_A l_{BA}\delta_A\sin\theta + \frac{1}{2}k_A\delta_A^2$$

$$+\frac{1}{2}k_C l_{BC}^2\sin^2\theta + k_C l_{BC}\delta_C\sin\theta + \frac{1}{2}k_C\delta_C^2 \tag{1}$$

where δ_A and δ_C are the spring elongations at the equilibrium position.

In the static equilibrium position,

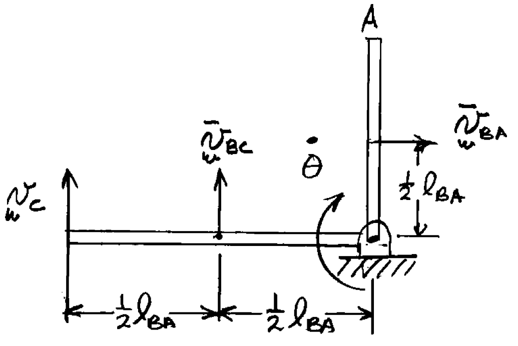
$$+\circlearrowleft\Sigma M_B = 0: \quad W_C l_{BC} + \frac{1}{2}W_{BC}l_{BC} + (k_A\delta_A)l_{BA} + (k_C\delta_C)l_{BC} = 0 \tag{2}$$

Substiting Eq. (2) into Eq. (1) gives

$$V = -\frac{1}{2}W_{BA}l_{BA}(1-\cos\theta) + \frac{1}{2}k_A l_{BA}^2\sin^2\theta$$

$$+\frac{1}{2}k_C l_{BC}^2\sin^2\theta + \frac{1}{2}k_A\delta_A^2 + \frac{1}{2}k_C\delta_C^2 \tag{3}$$

Kinematics for position with $\theta = 0$.



$$v_C = l_{BC}\dot{\theta}$$

$$\bar{v}_{BC} = \frac{1}{2}l_{BC}\dot{\theta}$$

$$\bar{v}_{BA} = \frac{1}{2}l_{BA}\dot{\theta}$$

Kinetic energy:

$$T = \frac{1}{2}m_C v_C^2 + \frac{1}{2}m_{BC}\bar{v}_{BC}^2 + \frac{1}{2}\bar{I}_{BC}\dot{\theta}^2 + \frac{1}{2}m_{BA}\bar{v}_{BA}^2 + \frac{1}{2}\bar{I}_{BA}\dot{\theta}^2$$

$$= \frac{1}{2}m_C\, l_{BC}^2\dot{\theta}^2 + \frac{1}{2}m_{BC}\left(\frac{1}{2}l_{BC}\dot{\theta}\right)^2 + \frac{1}{2}\left(\frac{1}{12}m_{BC}l_{BC}^2\right)\dot{\theta}^2$$

$$+\frac{1}{2}m_{BA}\left(\frac{1}{2}l_{BA}\dot{\theta}\right)^2 + \frac{1}{2}\left(\frac{1}{12}m_{BA}l_{BA}^2\right)\dot{\theta}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

$$= \frac{1}{2}\left(m_C l_{BC}^2 + \frac{1}{3} m_{BC} l_{BC}^2 + \frac{1}{3} m_B l_{BA}^2 \right) \dot{\theta}^2 \qquad (4)$$

Conservation of energy: $T_1 + V_1 = T_2 + V_2$ (5)

Position ①. (Maximum deflection) $\theta = \theta_m$

$$T_1 = 0 \qquad (6)$$

$$V_1 = -\frac{1}{2} W_{AB} l_{AB} (1 - \cos\theta_m) + \frac{1}{2} k_A l_{BA}^2 \sin^2\theta_m$$
$$+ \frac{1}{2} k_C l_{BC}^2 \sin^2\theta_m + \frac{1}{2} k_A \delta_A^2 + \frac{1}{2} k_C \delta_C^2$$

For small angle θ_m, $\sin\theta_m \approx \theta_m$

$$1 - \cos\theta_m = 2\sin^2\frac{\theta_m}{2} \approx \frac{1}{2}\theta_m^2$$

$$V_1 \approx \frac{1}{2}\left(-\frac{1}{2} W_{BA} l_{BA} + k_A l_{BA}^2 + k_C l_{BC}^2 \right) \theta_m^2$$
$$+ \frac{1}{2} k_A \delta_A^2 + \frac{1}{2} k_C \delta_C^2 \qquad (7)$$

Position ②: Maximum velocity. $\theta = 0$

For simple harmonic motion $\dot{\theta} = \omega_n \theta_m$ (8)

$$T_2 = \frac{1}{2}\left(m_{BC} l_{BC}^2 + \frac{1}{3} m_{BC} l_{BC}^2 + \frac{1}{3} m_{BA} l_{BA}^2 \right) \omega_n^2 \theta_m^2 \qquad (9)$$

Substituting Eqs. (6), (7), (8), and (9) into Eq. (5) and noting that the terms containing δ_A and δ_C cancel,

$$0 + \frac{1}{2}\left(-\frac{1}{2} W_{BA} l_{BC} + k_A l_{BA}^2 + k_C l_{BC}^2 \right) \theta_m^2$$
$$= \frac{1}{2}\left(m_C l_{BC}^2 + \frac{1}{3} m_{BC} l_{BC}^2 + \frac{1}{3} m_{BA} l_{BA}^2 \right) \omega_n^2 \theta_m^2 + 0$$

Applying the numerical data: $-\frac{1}{2} W_{BA} l_{BA} + k_A l_{BA}^2 + k_C l_{BC}^2$

$$= -\frac{1}{2}(2.3544)(0.2) + (350)(0.2)^2 + (260)(0.3)^2$$
$$= -0.23544 + 14.0 + 23.4 = 37.165 \text{ N} \cdot \text{m}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 19.98*

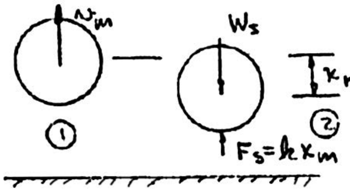
As a submerged body moves through a fluid, the particles of the fluid flow around the body and thus acquire kinetic energy. In the case of a sphere moving in an ideal fluid, the total kinetic energy acquired by the fluid is $\frac{1}{4}\rho V v^2$, where ρ is the mass density of the fluid, V is the volume of the sphere, and v is the velocity of the sphere. Consider a 500-g hollow spherical shell of radius 80 mm, which is held submerged in a tank of water by a spring of constant 500 N/m. (*a*) Neglecting fluid friction, determine the period of vibration of the shell when it is displaced vertically and then released. (*b*) Solve Part *a,* assuming that the tank is accelerated upward at the constant rate of 8 m/s^2.

SOLUTION

This is not a damped vibration. However, the kinetic energy of the fluid must be included.



(*a*) <u>*Position* ②</u>

$$T_2 = 0$$

$$V_2 = \frac{1}{2}kx_m^2$$

<u>*Position* ①</u>

$$T_1 = T_{\text{spere}} + T_{\text{fluid}} = \frac{1}{2}m_s v_m^2 + \frac{1}{4}\rho V v_m^2$$

$$V_1 = 0$$

<u>Conservation of energy and simple harmonic motion</u>.

$$T_1 + V_1 = T_2 + V_2: \qquad \frac{1}{2}m_s v_m^2 + \frac{1}{4}\rho V v_m^2 + 0 = 0 + \frac{1}{2}kx_m^2$$

$$v_m = \dot{x}_m = x_m \omega_n$$

$$\frac{1}{2}\left(m_s + \frac{1}{2}\rho V\right)x_m^2\omega_n^2 = \frac{1}{2}kx_m^2$$

$$\omega_n^2 = \frac{k}{m_s + \frac{1}{2}\rho V}$$

$$\omega_n^2 = \frac{500 \text{ N/m}}{(0.5 \text{ kg}) + \left(\frac{1}{2}\rho V\right)}$$

$$\frac{1}{2}\rho V = \frac{1}{2}(1000 \text{ kg/m}^3)\left(\frac{4}{3}\pi(0.08 \text{ m})^3\right)$$

$$\frac{1}{2}\rho V = 1.0723 \text{ kg}$$

$$\omega_n^2 = \frac{500 \text{ N/m}}{(0.5 \text{ kg}) + (1.0723 \text{ kg})} = 318 \text{ s}^{-2}$$

<u>Period of vibration</u>.

$$\tau_n = \frac{2\pi}{\omega_n} = \frac{2\pi}{\sqrt{318}} \qquad \tau_n = 0.352 \text{ s} \blacktriangleleft$$

(*b*) Acceleration does not change mass. $\tau_n = 0.352$ s ◀

PROBLEM 19.99

A 20-kg block is attached to a spring of constant $k = 8$ N/m and can move without friction in a vertical slot as shown. The block is acted upon by a periodic force of magnitude $P = P_m \sin \omega_f t$, where $P_m = 100$ N. Determine the amplitude of the motion of the block if (*a*) $\omega_f = 10$ rad/s, (*b*) $\omega_f = 19$ rad/s, (*c*) $\omega_f = 30$ rad/s.

SOLUTION

Equation of motion: $m\ddot{x} + kx = P_m \sin \omega_f t$

The steady state response is

$$x_m = \frac{P_m / k}{1 - \left(\frac{\omega_f}{\omega_n}\right)^2}$$

where

$$\omega_n = \sqrt{\frac{k}{m}} = \sqrt{\frac{8000 \text{ N/m}}{20 \text{ kg}}} = 20 \text{ rad/s}$$

and

$$P_m / k = \frac{100 \text{ N}}{8000 \text{ N/m}} = 0.0125 \text{ m}$$

(*a*) $\omega_f = 10$ rad/s:

$$\frac{\omega_f}{\omega_n} = \frac{10}{20} = 0.5$$

$$x_m = \frac{0.0125}{1 - (0.5)^2} = 0.01667 \text{ m}$$

$x_m = 166.7$ mm ◀ (in-phase)

(*b*) $\omega_f = 19$ rad/s:

$$\frac{\omega_f}{\omega_n} = \frac{19}{20} = 0.95$$

$$x_m = \frac{0.0125}{1 - (0.95)^2} = 0.1282 \text{ m}$$

$x_m = 128.2$ mm ◀ (in-phase)

(*c*) $\omega_f = 30$ rad/s:

$$\frac{\omega_f}{\omega_n} = \frac{30}{20} = 1.5$$

$$x_m = \frac{0.0125}{1 - (1.5)^2} = -0.0100 \text{ m}$$

$x_m = 10.00$ mm ◀ (out-of-phase)

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 19.100

A 20-kg block is attached to a spring of constant $k = 8$ kN/m and can move without friction in a vertical slot as shown. The block is acted upon by a periodic force of magnitude $P = P_m \sin \omega_f t$, where $P_m = 10$ N. Knowing that the amplitude of the motion is 3 mm, determine the value of ω_f.

SOLUTION

Equation of motion: $$m\ddot{x} + kx = P_m \sin \omega_f t$$

The steady state response is $$x_m = \frac{P_m/k}{1-\left(\frac{\omega_f}{\omega_n}\right)^2}$$

where $$\omega_n = \sqrt{\frac{k}{m}} = \sqrt{\frac{8000 \text{ N/m}}{20 \text{ kg}}} = 20 \text{ rad/s}$$

and $$P_m/k = \frac{10 \text{ N}}{8000 \text{ N/m}} = 0.00125 \text{ m}$$

Solve for ω_f/ω_n: $$\frac{\omega_f}{\omega_n} = \left(1 - \frac{P_m}{kx_m}\right)^{1/2}$$

The amplitude is 3 mm so that $x_m = \pm 0.003$ m.

so that $$\frac{P_m}{kx_m} = \frac{0.00125 \text{ m}}{\pm 0.003} = \pm 0.41667$$

For the in-phase motion,

$$\frac{\omega_f}{\omega_n} = (1 - 0.41667)^{1/2} = 0.76376$$

$$\omega_f = (0.76376)(20 \text{ rad/s})$$

$\omega_f = 15.28$ rad/s ◀

For the out-of-phase motion, $$\frac{\omega_f}{\omega_n} = (1 + 0.41667)^{1/2} = 1.19024$$

$$\omega_f = (1.19024)(20 \text{ rad/s})$$

$\omega_f = 23.8$ rad/s ◀

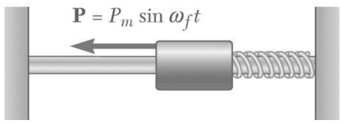
PROBLEM 19.101



A 9-lb collar can slide on a frictionless horizontal rod and is attached to a spring of constant k. It is acted upon by a periodic force of magnitude $P = P_m \sin \omega_f t$, where $P_m = 2$ lb and $\omega_f = 5$ rad/s. Determine the value of the spring constant k knowing that the motion of the collar has an amplitude of 6 in. and is (*a*) in phase with the applied force, (*b*) out of phase with the applied force.

SOLUTION

Eq. (19.33): $$x_m = \frac{\frac{P_m}{k}}{1 - \left(\frac{\omega_f}{\omega_n}\right)^2} \qquad \omega_n^2 = \frac{k}{m}$$

$$x_m = \frac{P_m}{k - m\omega_f^2}$$

$$k = \frac{P_m}{x_m} + m\omega_f^2$$

Data: $$P_m = 2 \text{ lb}, \qquad m = \frac{W}{g} = \frac{9}{32.2} = 0.2795 \text{ lb} \cdot \text{s}^2/\text{ft}$$

$$\omega_f = 5 \text{ rad/s}$$

$$k = \frac{P_m}{x_m} + (0.2795)(5)^2$$

$$= \frac{P_m}{x_m} + 6.9876$$

(*a*) (In phase) $$x_m = 6 \text{ in.} = 0.5 \text{ ft}$$

$$k = \frac{2}{0.5} + 6.9876$$

$k = 10.99$ lb/ft ◀

(*b*) (Out of phase) $$x_m = -6 \text{ in.} = -0.5 \text{ ft}$$

$$k = \frac{2}{-0.5} + 6.9876$$

$k = 2.99$ lb/ft ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. PROBLEM 19.102

A collar of mass m which slides on a frictionless horizontal rod is attached to a spring of constant k and is acted upon by a periodic force of magnitude $P = P_m \sin \omega_f t.$ Determine the range of values of ω_f for which the amplitude of the vibration exceeds two times the static deflection caused by a constant force of magnitude P_m.

SOLUTION

Circular natural frequency. $\omega_n = \sqrt{\dfrac{k}{m}}$

For forced vibration, the equation of motion is

$$m\ddot{x} + kx = P_m \sin(\omega_f t + \varphi)$$

The amplitude of vibration is

$$x_m = \frac{\frac{P_m}{k}}{\left|1 - \left(\frac{\omega_f}{\omega_n}\right)^2\right|} = \frac{\delta_{\text{st}}}{\left|\left(1 - \frac{\omega_f}{\omega_n}\right)^2\right|}$$

For $\omega_f < \omega_n$ and $x_m = 2\,\delta_{\text{st}}$, we have

$$2\,\delta_{\text{st}} = \frac{\delta_{\text{st}}}{1 - \left(\frac{\omega_f}{\omega_n}\right)^2} \quad \text{or} \quad 1 - \left(\frac{\omega_f}{\omega_n}\right)^2 = \frac{1}{2}$$

$$\omega_f^2 = \frac{1}{2}\omega_n^2 = \frac{1}{2}\frac{k}{m} \qquad \omega_f = \sqrt{\frac{k}{2m}} \tag{1}$$

For $\sqrt{\dfrac{k}{2m}} < \omega_f \le \omega_n,$ $|x_m|$ exceeds $2\delta_{\text{st}}$

For $\omega_f > \omega_n$ and $x_m = 2\delta_{\text{st}}$, we have

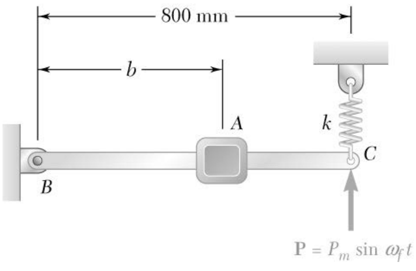
$$2\delta_{\text{st}} = \frac{\delta_{\text{st}}}{(\omega_f - \omega_n)^2 - 1} \quad \text{or} \quad \frac{\omega_f^2}{\omega_n^2} - 1 = \frac{1}{2}$$

$$\omega_f^2 = \frac{3}{2}\omega_n^2 = \frac{3}{2}\frac{k}{m} \qquad \omega_f = \sqrt{\frac{3k}{2m}} \tag{2}$$

For $\omega_n \le \omega_f \le \sqrt{\dfrac{3k}{2m}}$ $|x_m|$ exceeds $2\delta_{\text{st}}$

From Eqs. (1) and (2), Range: $\sqrt{\dfrac{k}{2m}} < \omega_f < \sqrt{\dfrac{3k}{2m}}$ ◀

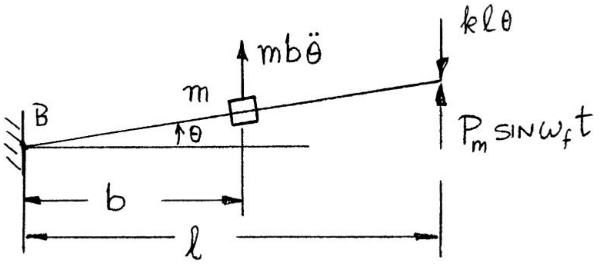
If you are a student using this Manual, you are using it without permission.*



PROBLEM 19.103

A small 20-kg block A is attached to the rod BC of negligible mass which is supported at B by a pin and bracket and at C by a spring of constant $k = 2$ kN/m. The system can move in a vertical plane and is in equilibrium when the rod is horizontal. The rod is acted upon at C by a periodic force **P** of magnitude $P = P_m \sin \omega_f t$, where $P_m = 6$ N. Knowing that $b = 200$ mm, determine the range of values of ω_f for which the amplitude of vibration of block A exceeds 3.5 mm.

SOLUTION



$$+\circlearrowleft \Sigma M_B = mb^2\ddot{\theta} = -kl^2\theta + P_m l \sin \omega_f t$$

$$mb^2\ddot{\theta} + kl^2\theta = P_m l \sin \omega_f t$$

$$\omega_n = \sqrt{\frac{kl^2}{mb^2}} = 40 \text{ rad/s}, \ \theta = \theta_m \sin \omega_f t$$

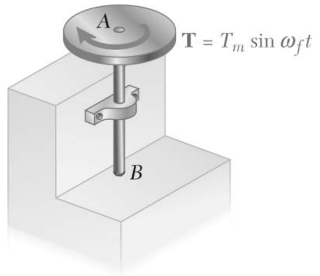
$$\theta_m = \frac{\pm 3.5 \text{ mm}}{b} = \pm 0.0175 \text{ rad} = \frac{\frac{P_m l}{mb^2}}{\omega_n^2 - \omega_f^2} = \frac{6}{1600 - \omega_f^2}$$

Lower frequency: $\quad 6 = 0.0175\left(1600 - \omega_f^2\right), \quad \omega_f = 35.5 \text{ rad/s}$

Upper frequency: $\quad 6 = -0.0175\left(1600 - \omega_f^2\right), \quad \omega_f = 44.1 \text{ rad/s}$

$35.5 \text{ rad/s} < \omega_f < 44.1 \text{ rad/s}$ ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



PROBLEM 19.104

An 8-kg uniform disk of radius 200 mm is welded to a vertical shaft with a fixed end at B. The disk rotates through an angle of $3°$ when a static couple of magnitude $50\ \text{N}\cdot\text{m}$ is applied to it. If the disk is acted upon by a periodic torsional couple of magnitude $T = T_m \sin \omega_f t$, where $T_m = 60\ \text{N}\cdot\text{m}$, determine the range of values of ω_f for which the amplitude of the vibration is less than the angle of rotation caused by a static couple of magnitude T_m.

SOLUTION

Mass moment of inertia: $\bar{I} = \frac{1}{2}mr^2 = \frac{1}{2}(8)(0.200)^2 = 0.16\ \text{kg}\cdot\text{m}^2$

Torsional spring constant: $K = \dfrac{T}{\theta}$

$$T = 50\ \text{N}\cdot\text{m}$$

$$\theta = 3° = 0.05236\ \text{rad}$$

$$K = \frac{50}{0.05236} = 954.93\ \text{N}\cdot\text{m/rad}$$

Natural circular frequency: $\omega_n = \sqrt{\dfrac{K}{I}} = \sqrt{\dfrac{954.93}{0.16}} = 77.254\ \text{rad/s}$

For forced vibration,

$$\theta_m = \frac{\frac{T_m}{K}}{1 - \left(\frac{\omega_f}{\omega_n}\right)^2} = \frac{\theta_{\text{st}}}{1 - \left(\frac{\omega_f}{\omega_n}\right)^2}$$

For the amplitude $|\theta_m|$ to be less than θ_{st}, we must have $\omega_f > \omega_n$.

Then

$$|\theta_m| = \frac{\theta_{\text{st}}}{\left(\frac{\omega_f}{\omega_n}\right)^2 - 1} < \theta_{\text{st}}$$

$$\left(\frac{\omega_f}{\omega_n}\right)^2 - 1 > 1$$

$$\left(\frac{\omega_f}{\omega_n}\right)^2 > 2 \qquad \omega_f > \sqrt{2}\omega_n = (\sqrt{2})(77.254)$$

$$\omega_f > 109.3\ \text{rad/s} \blacktriangleleft$$

PROBLEM 19.105

An 18-lb block A slides in a vertical frictionless slot and is connected to a moving support B by means of a spring AB of constant $k = 10$ lb/in. Knowing that the displacement of the support is $\delta = \delta_m \sin \omega_f t,$ where $\delta_m = 6$ in., determine the range of values of ω_f for which the amplitude of the fluctuating force exerted by the spring on the block is less than 30 lb.

SOLUTION

Natural circular frequency:
$$\omega_n = \sqrt{\frac{k}{m}} = \sqrt{\frac{10\times 12}{\frac{18\text{ lb}}{32.2}}} = 14.652 \text{ rad/s}$$

Eq. (19.33′):
$$x_m = \frac{\delta_m}{1-\left(\frac{\omega_f}{\omega_n}\right)^2}$$

Spring force:
$$F_m = -k(x_m - \delta_m) = -k\delta_m\left[1 - \frac{1}{1-\left(\frac{\omega_f}{\omega_n}\right)^2}\right]$$

$$= k\delta_m \frac{\left(\frac{\omega_f}{\omega_n}\right)^2}{1-\left(\frac{\omega_f}{\omega_n}\right)^2}$$

$$= (120)(0.50)\frac{\left(\frac{\omega_f}{\omega_n}\right)^2}{1-\left(\frac{\omega_f}{\omega_n}\right)^2} = 60\frac{\left(\frac{\omega_f}{\omega_n}\right)^2}{1-\left(\frac{\omega_f}{\omega_n}\right)^2}$$

Limit on spring force:
$$|F_m| < 30 \text{ lb}$$

$$60\left|\frac{\left(\frac{\omega_f}{\omega_n}\right)^2}{1-\left(\frac{\omega_f}{\omega_n}\right)^2}\right| < 30 \quad \text{or} \quad \left|\frac{\left(\frac{\omega_f}{\omega_n}\right)^2}{1-\left(\frac{\omega_f}{\omega_n}\right)^2}\right| < \frac{1}{2}$$

PROBLEM 19.106

A cantilever beam *AB* supports a block which causes a static deflection of 8 mm at *B*. Assuming that the support at *A* undergoes a vertical periodic displacement $\delta = \delta_m \sin \omega_f t,$ where $\delta_m = 2$ mm, determine the range of values of ω_f for which the amplitude of the motion of the block will be less than 4 mm. Neglect the weight of the beam and assume that the block does not leave the beam.

SOLUTION

For the static condition. $\quad mg = k\delta_{st}$

Natural circular frequency.

$$\omega_n = \sqrt{\frac{k}{m}} = \sqrt{\frac{g}{\delta_{st}}}$$

$$g = 9.81 \text{ m/s}, \quad \delta_{st} = 8 \text{ mm} = 0.008 \text{ m}$$

$$\omega_n = \sqrt{\frac{9.81}{0.008}} = 35.018 \text{ rad/s}$$

From Eqs. (19.31 and 19.33′):

$$(x_m)_B = \frac{\delta_m}{1 - \left(\frac{\omega_f}{\omega_n}\right)^2}$$

Conditions: $\quad |x_m|_B < 4 \text{ mm} \qquad \delta_m = 2 \text{ mm}$

<u>In phase motion</u>.

$$\frac{\delta_m}{1 - \left(\frac{\omega_f}{\omega_n}\right)^2} < x_m$$

$$\frac{1 - \left(\frac{\omega_f}{\omega_n}\right)^2}{\delta_m} > \frac{1}{x_m}$$

$$1 - \left(\frac{\omega_f}{\omega_n}\right)^2 > \frac{\delta_m}{x_m}$$

$$1 - \frac{\delta_m}{x_m} > \left(\frac{\omega_f}{\omega_n}\right)^2$$

$$\omega_f < \left(\sqrt{1 - \frac{\delta_m}{x_m}}\right)\omega_n$$

$$\omega_f < \left(\sqrt{1 - \frac{2}{4}}\right)(35.018)$$

$\omega_f < 24.8$ rad/s ◀

PROBLEM 19.107

Rod AB is rigidly attached to the frame of a motor running at a constant speed. When a collar of mass m is placed on the spring, it is observed to vibrate with an amplitude of 15 mm. When two collars, each of mass m, are placed on the spring, the amplitude is observed to be 18 mm. What amplitude of vibration should be expected when three collars, each of mass m, are placed on the spring? (Obtain two answers.)

SOLUTION

(a) *One collar*: $(x_m)_1 = 15 \text{ mm} \qquad (\omega_n)_1^2 = \dfrac{k}{m}$

(b) *Two collars*: $(x_m)_2 = 18 \text{ mm} \qquad (\omega_n)_2^2 = \dfrac{k}{2m} = \dfrac{1}{2}(\omega_n)_1^2$

$$\left(\frac{\omega}{\omega_n}\right)_2 = \sqrt{2}\left(\frac{\omega}{\omega_n}\right)_1$$

(c) *Three collars*:

$$(x_m)_3 = \text{unknown}, \quad (\omega_n)_3^2 = \frac{k}{3m} = \frac{1}{3}(\omega_n)_1^2, \qquad \left(\frac{\omega}{\omega_n}\right)_3 = \sqrt{3}\left(\frac{\omega}{\omega_n}\right)_1$$

We also note that the amplitude δ_m of the displacement of the base remains constant.

Referring to Section 19.7, Figure 19.9, we note that, since $(x_m)_2 > (x_m)_1$ and $\frac{\omega}{(\omega_n)_2} > \frac{\omega}{(\omega_n)_1}$, we must have $\frac{\omega}{(\omega_n)_1} < 1$ and $(x_m)_1 > 0$. However, $\frac{\omega}{(\omega_n)_2}$ may be either < 1 or > 1, with $(x_m)_2$ being correspondingly either > 0 or < 0.

1. *Assuming* $(x_m)_2 > 0$:

For one collar,

$$(x_m)_1 = \frac{\delta_m}{1 - \left(\frac{\omega}{\omega_n}\right)_1^2} \qquad +15 \text{ mm} = \frac{\delta_m}{1 - \left(\frac{\omega}{\omega_n}\right)_1^2} \tag{1}$$

For two collars,

$$(x_m)_2 = \frac{\delta_m}{1 - \left(\frac{\omega}{\omega_n}\right)_2^2} \qquad +18 \text{ mm} = \frac{\delta_m}{1 - 2\left(\frac{\omega}{\omega_n}\right)_1^2} \tag{2}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 19.107 (Continued)

Dividing Eq. (2) by Eq. (1), member by member:

$$1.2 = \frac{1 - \left(\frac{\omega}{\omega_n}\right)_1^2}{1 - 2\left(\frac{\omega}{\omega_n}\right)_1^2}; \quad \text{we find } \left(\frac{\omega}{\omega_n}\right)_1^2 = \frac{1}{7}$$

Substituting into Eq. (1), $\delta_m = (15 \text{ mm})\left(1 - \frac{1}{7}\right) = \frac{90}{7} \text{ mm}$

For three collars,

$$(x_m)_3 = \frac{\delta_m}{1 - 3\left(\frac{\omega}{\omega_n}\right)_1^2} = \frac{\left(\frac{90}{7}\right) \text{ mm}}{1 - 3\left(\frac{1}{7}\right)} = \frac{90}{4} \text{ mm}, \qquad (x_m)_3 = 22.5 \text{ mm} \blacktriangleleft$$

2. *Assuming* $(x_m)_2 < 0$:

For two collars, we have $-18 \text{ mm} = \frac{\delta_m}{1 - 2\left(\frac{\omega}{\omega_n}\right)_1^2}$ (3)

Dividing Eq. (3) by Eq. (1), member by member:

$$-1.2 = \frac{1 - \left(\frac{\omega}{\omega_n}\right)_1^2}{1 - 2\left(\frac{\omega}{\omega_n}\right)_1^2}$$

$$-1.2 + 2.4\left(\frac{\omega}{\omega_n}\right)_1^2 = 1 - \left(\frac{\omega}{\omega_n}\right)_1^2$$

$$\left(\frac{\omega}{\omega_n}\right)_1^2 = \frac{2.2}{3.4} = \frac{1.1}{1.7}$$

Substitute into Eq. (1), $\delta_m = (15 \text{ mm})\left(1 - \frac{1.1}{1.7}\right) = \frac{9}{1.7} \text{ mm}$

For three collars,

$$(x_m)_3 = \frac{\delta_m}{1 - 3\left(\frac{\omega}{\omega_n}\right)_1^2} = \frac{\left(\frac{9}{1.7}\right)}{1 - 3\left(\frac{1.1}{1.7}\right)} = \frac{9 \text{ mm}}{-1.6}, \qquad (x_m)_3 = -5.63 \text{ mm} \blacktriangleleft$$

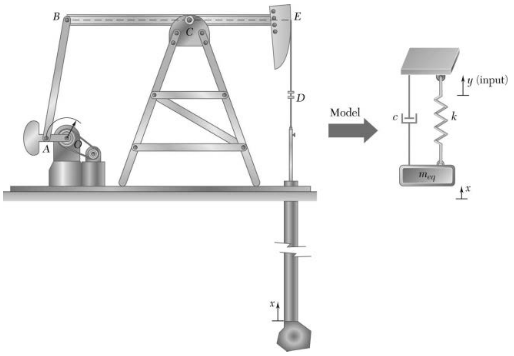
PROBLEM 19.108



The crude-oil-pumping rig shown in the accompanying figure is driven at 20 rpm. The inside diameter of the well pipe is 2 in., and the diameter of the pump rod is 0.75 in. The length of the pump rod and the length of the column of oil lifted during the stroke are essentially the same, and equal to 6000 ft. During the downward stroke, a valve at the lower end of the pump rod opens to let a quantity of oil into the well pipe, and the column of oil is then lifted to obtain a discharge into the connecting pipeline. Thus, the amount of oil pumped in a given time depends upon the stroke of the lower end of the pump rod. Knowing that the upper end of the rod at *D* is essentially sinusoidal with a stroke of 45 in. and the specific weight of crude oil is 56.2 lb/ft^3, determine (*a*) the output of the well in ft^3/min if the shaft is rigid, (*b*) the output of the well in ft^3/min if the stiffness of the rod is 2210 N/m, the equivalent mass of the oil and shaft is 290 kg and damping is negligible.

SOLUTION

Forcing frequency: $\omega_f = 20 \text{ rpm} = 2.0944 \text{ rad/s}$

Cross sectional area of the flow chamber

$$A_{\text{oil}} = \frac{\pi}{4}\left[(2 \text{ in.})^2 - (0.75 \text{ in.})^2\right] = 2.6998 \text{ in}^2 = 0.018749 \text{ ft}^2$$

Let *s* be the stroke at the lower end of the pump in feet. Stroke is twice the amplitude. $s = 2x_m$

Volume of oil pumped per revolution:

$$V_{\text{oil}} = A_{\text{oil}}s = 0.018749s$$

Amplitude of motion at top of shaft:

$$\delta_m = \frac{1}{2}(45 \text{ in.}) = 22.5 \text{ in.} = 1.875 \text{ ft}$$

Amplitude of motion at bottom of shaft:

$$x_m = \frac{\delta_m}{1 - \left(\frac{\omega_f}{\omega_n}\right)^2}$$

(*a*) Rigid shaft:

$$\omega_n = \infty$$

$$x_m = \delta_m = 1.875 \text{ ft}$$

$$s = (2)(1.875) = 3.75 \text{ ft}$$

$$V_{\text{oil}} = (0.018749 \text{ ft}^2)(3.75 \text{ ft}) = 0.070309 \text{ ft}^3/\text{rev}$$

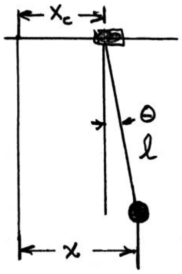
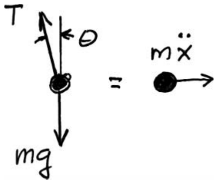
PROBLEM 19.109

A simple pendulum of length l is suspended from a collar C which is forced to move horizontally according to the relation $x_C = \delta_m \sin \omega_f t$. Determine the range of values of ω_f for which the amplitude of the motion of the bob is less than δ_m. (assume that δ_m is small compared with the length l of the pendulum).

SOLUTION





<u>Geometry</u>.

$$x = x_C + l \sin \theta$$

$$\sin \theta = \frac{x - x_C}{l}$$

$$+\uparrow \Sigma F_y = ma_y \approx 0: \quad T \cos \theta - mg = 0 \qquad T \approx mg$$

$$\xrightarrow{+} \Sigma F_x = ma_x: \qquad -T \sin \theta = m\ddot{x}$$

$$m\ddot{x} + \frac{mg(x - x_C)}{l} = 0$$

$$\ddot{x} + \frac{g}{l} x = \frac{g}{l} x_C$$

Using the given motion of x_C,

$$\ddot{x} + \frac{g}{l} x = \frac{g}{l} \delta_m \sin \omega_f t$$

<u>Circular natural frequency</u>.

$$\omega_n = \sqrt{\frac{g}{l}}$$

$$\ddot{x} + \omega_n^2 x = \omega_n^2 \delta_m \sin \omega_f t$$

The steady state response is

$$x_m = \frac{\delta_m}{1 - \left(\frac{\omega_f}{\omega_n}\right)^2}$$

$$x_m^2 = \frac{\delta_m^2}{\left[1 - \left(\frac{\omega_f}{\omega_n}\right)^2\right]^2} \le \delta_m^2$$

Consider $\quad x_m^2 = \delta_m^2.$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. If you are a student using this Manual, you are using it without permission.*

PROBLEM 19.109 (Continued)

Then $$\left[1-\left(\frac{\omega_f}{\omega_n}\right)^2\right]^2 = 1-2\left(\frac{\omega_f}{\omega_n}\right)^2+\left(\frac{\omega_f}{\omega_n}\right)^4 = 1$$

$$\left(\frac{\omega_f}{\omega_n}\right)^2 = 0 \quad \text{and} \quad \left(\frac{\omega_f}{\omega_n}\right)^2 = 2$$

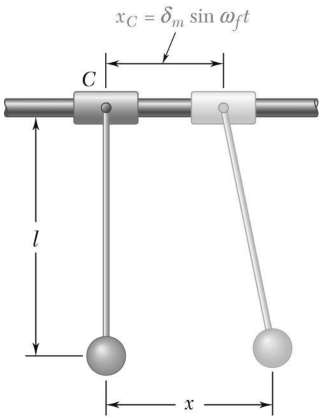
$$\left(\frac{\omega_f}{\omega_n}\right) = 0 \quad \text{and} \quad \frac{\omega_f}{\omega_n} = \sqrt{2}$$

For $$0 < \frac{\omega_f}{\omega_n} < \sqrt{2}, \quad |x_m| > \delta_m$$

For $$\frac{\omega_f}{\omega_n} > \sqrt{2}, \quad |x_m| < \delta_n$$

Then $$\omega_f > \sqrt{2}\,\omega_n = \sqrt{\frac{2g}{l}}$$ $$\omega_f > \sqrt{\frac{2g}{l}} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

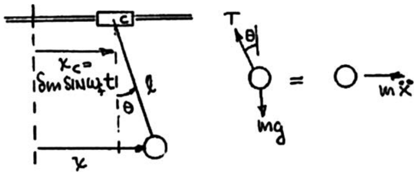


PROBLEM 19.110

The 2.75-lb bob of a simple pendulum of length $l = 24$ in. is suspended from a 3-lb collar C. The collar is forced to move according to the relation $x_C = \delta_m \sin \omega_f t$, with an amplitude $\delta_m = 0.4$ in. and a frequency $f_f = 0.5$ Hz. Determine (*a*) the amplitude of the motion of the bob, (*b*) the force that must be applied to collar C to maintain the motion.

SOLUTION

(*a*)



$$\Sigma F_x = ma_x$$
$$-T\sin\theta = m\ddot{x}$$
$$\Sigma F_y = T\cos\theta - mg = 0$$

For small angles $\cos\theta \approx 1$. Acceleration in the y direction is second order and is neglected.

$$T = mg$$
$$m\ddot{x} = -mg\sin\theta$$
$$\sin\theta = \frac{x - x_c}{l}$$
$$m\ddot{x} + \frac{mg}{l}x = \frac{g}{l}x_c = \frac{mg}{l}\delta_m \sin\omega_f t$$
$$\omega_n^2 = \frac{g}{l}$$
$$\ddot{x} + \omega_n^2 x = \omega_n^2 \delta_m \sin\omega_f t$$

From Equation (19.33′):

$$x_m = \frac{\delta_m}{1 - \frac{\omega_f^2}{\omega_n^2}}$$

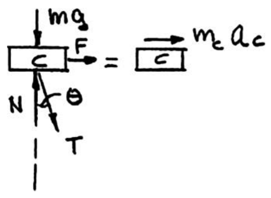
So

$$\omega_f^2 = (2\pi f_f)^2 = 4\pi^2(0.5)^2 = \pi^2 \ s^{-2}$$
$$\omega_n^2 = \frac{g}{l} = \frac{32.2 \text{ ft/s}^2}{2 \text{ ft}} = 16.1 \text{ s}^{-2}$$
$$x_m = \frac{\frac{0.4}{12} \text{ ft}}{1 - \frac{\pi^2}{16.1}} = 0.086137 \text{ ft}$$

$x_m = 1.034$ in. ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

(*b*)



$$a_c = \ddot{x}_c = -\delta_m \omega_f^2 \sin \omega_f t$$

$$\xrightarrow{+} \Sigma F_x = m_c a_c$$

$$F - T\sin\theta = m_c a_c$$

From Part (*a*): $\quad T = mg, \quad \sin\theta = \dfrac{x - x_c}{l}$

Thus, $\quad F = -mg\left[\dfrac{x - x_c}{l}\right] + m_c \ddot{x}_c$

$$= -m\omega_n^2 x + m\omega_n^2 x_c + m_c \ddot{x}_c$$

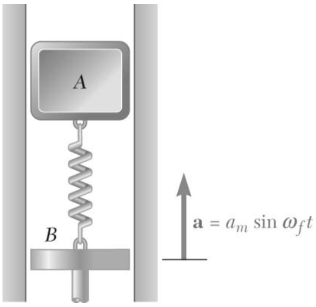
$$= -m\omega_n^2 x_m \sin\omega_f t + m\omega_n^2 \delta_m \sin\omega_f t - m_c \omega_f^2 \delta_m \sin\omega_f t$$

$$= \left[-\left(\frac{2.75\text{ lb}}{32.2}\right)(16.1)(0.086137) + \left(\frac{2.75\text{ lb}}{32.2}\right)(16.1)\left(\tfrac{0.4}{12}\right) - \left(\frac{3\text{ lb}}{32.2}\right)\pi^2\left(\tfrac{0.4}{12}\right)\right]\sin\pi t$$

$$= -0.10326\sin\pi t$$

$F = -0.1033\sin\pi t$ (lb) ◀

All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



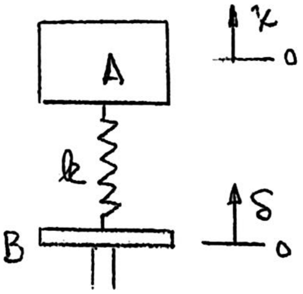
PROBLEM 19.111

An 18-lb block A slides in a vertical frictionless slot and is connected to a moving support B by means of a spring AB of constant $k = 8$ lb/ft. Knowing that the acceleration of the support is $a = a_m \sin \omega_f t$, where $a_m = 5$ ft/s^2 and $\omega_f = 6$ rad/s, determine (a) the maximum displacement of block A, (b) the amplitude of the fluctuating force exerted by the spring on the block.

SOLUTION

(a) Support motion.

$$a = \ddot{\delta} = a_m \sin \omega_f t$$



$$\delta = -\left(\frac{a_m}{\omega_f^2}\right) \sin \omega_f t$$

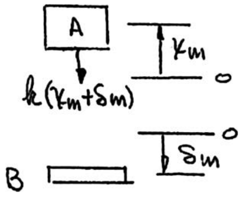
$$\delta_m = \frac{-a_m}{\omega_f^2} = -\frac{5 \text{ ft/s}^2}{(6 \text{ rad/s})^2} = -0.13889 \text{ ft}$$

From Equations (19.31 and 19.33′):

$$x_m = \frac{\delta_m}{1 - \frac{\omega_f^2}{\omega_n^2}} \qquad \omega_n^2 = \frac{k}{m} = \frac{8 \text{ lb/ft}}{\frac{18}{32.2}} = 14.311 \text{ (rad/s)}^2$$

$$x_m = \frac{-0.13889}{1 - \left(\frac{36}{14.311}\right)} = 0.091643 \text{ ft}$$

$x_m = 1.100$ in. ◀



(b) x is out of phase with δ for $\omega_f = 6$ rad/s.

Thus,

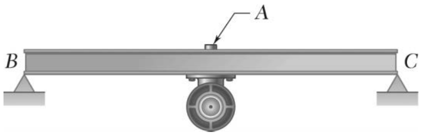
$$F_m = k(x_m + \delta_m) = 8 \text{ lb/ft} (0.091643 \text{ ft} + 0.13889 \text{ ft})$$

$$= 1.8443 \text{ lb}$$

$F_m = 1.844$ lb ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 19.112



A variable-speed motor is rigidly attached to a beam BC. When the speed of the motor is less than 600 rpm or more than 1200 rpm, a small object placed at A is observed to remain in contact with the beam. For speeds between 600 and 1200 rpm the object is observed to "dance" and actually to lose contact with the beam. Determine the speed at which resonance will occur.

SOLUTION

Let m be the unbalanced mass and $\bar{r}$ the eccentricity of the unbalanced mass. The vertical force exerted on the beam due to the rotating unbalanced mass is

$$P = m\bar{r}\omega_f^2 \sin \omega_f t = P_m \sin \omega_f t$$

Then from Eq. 19.33,
$$x_m = \frac{\frac{P_m}{k}}{1-\left(\frac{\omega_f}{\omega_n}\right)^2} = \frac{\frac{m\bar{r}\omega_f^2}{k}}{1-\left(\frac{\omega_f}{\omega_n}\right)^2}$$

For simple harmonic motion, the acceleration is

$$a_m = -\omega_f^2 x_m = \frac{\frac{m\bar{r}\omega_f^4}{k}}{1-\left(\frac{\omega_f}{\omega_n}\right)^2}$$

When the object loses contact with the beam, the acceleration $|a_m|$ is greater than g.
Let $\omega_1 = 600 \text{ rpm} = 62.832 \text{ rad/s}$.

$$|a_m|_1 = \frac{\frac{m\bar{r}\omega_1^4}{k}}{1-\left(\frac{\omega_1}{\omega_n}\right)^2} = \frac{\frac{mr\omega_n^4 U^4}{k}}{1-U^2} \qquad (1)$$

where
$$U = \frac{\omega_1}{\omega_n}.$$

Let
$$\omega_2 = 1200 \text{ rpm} = 125.664 \text{ rad/s} = 2\omega_1$$

$$|a_m|_2 = \frac{\frac{m\bar{r}\omega_2^4}{k}}{\left(\frac{\omega_2}{\omega_n}\right)^2 - 1} = \frac{\frac{mr\omega_n^4 (2U)^4}{k}}{4U^2 - 1} \qquad (2)$$

PROBLEM 19.113

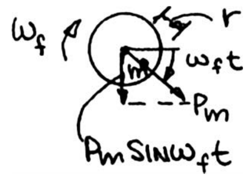
A motor of mass M is supported by springs with an equivalent spring constant k. The unbalance of its rotor is equivalent to a mass m located at a distance r from the axis of rotation. Show that when the angular velocity of the motor is ω_f, the amplitude x_m of the motion of the motor is

$$x_m = \frac{r\left(\frac{m}{M}\right)\left(\frac{\omega_f}{\omega_n}\right)^2}{1-\left(\frac{\omega_f}{\omega_n}\right)^2}$$

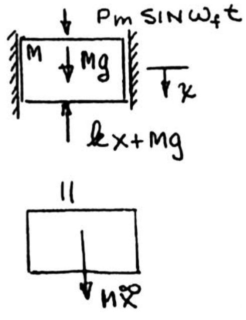
where $\omega_n = \sqrt{\dfrac{k}{M}}$.

SOLUTION

Rotor



Motor



$$+\downarrow \Sigma F = ma \quad P_m \sin \omega_f t - kx = M\ddot{x}$$

$$M\ddot{x} + kx = P_m \sin \omega_f t$$

$$\ddot{x} + \frac{k}{M}x = \frac{P_m}{M}\sin \omega_f t$$

$$\omega_n^2 = \frac{k}{M}$$

From Equation (19.33):

$$x_m = \frac{\frac{P_m}{k}}{1-\left(\frac{\omega_f}{\omega_n}\right)^2}$$

But

$$\frac{P_m}{k} = \frac{mr\omega_f^2}{k} \qquad k = M\omega_n^2$$

$$\frac{P_m}{k} = r\left(\frac{m}{M}\right)\left(\frac{\omega_f}{\omega_n}\right)^2$$

Thus,

$$x_m = \frac{r\left(\frac{m}{M}\right)\left(\frac{\omega_f}{\omega_n}\right)^2}{1-\left(\frac{\omega_f}{\omega_n}\right)^2} \quad \text{Q.E.D.} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

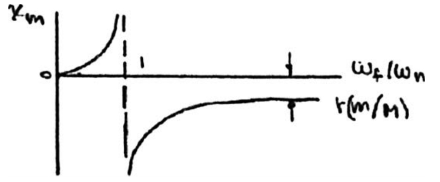
PROBLEM 19.114

As the rotational speed of a spring-supported 100-kg motor is increased, the amplitude of the vibration due to the unbalance of its 15-kg rotor first increases and then decreases. It is observed that as very high speeds are reached, the amplitude of the vibration approaches 3.3 mm. Determine the distance between the mass center of the rotor and its axis of rotation. (*Hint:* Use the formula derived in Problem 19.113.)

SOLUTION

Use the equation derived in Problem 19.113.

$$x_m = \frac{r\left(\frac{m}{M}\right)\left(\frac{\omega_f}{\omega_n}\right)^2}{1-\left(\frac{\omega_f}{\omega_n}\right)^2} = \frac{r\left(\frac{m}{M}\right)}{\frac{1}{\left(\frac{\omega_f}{\omega_n}\right)^2}-1}$$



For very high speeds, $\quad \dfrac{1}{\left(\frac{\omega_f}{\omega_n}\right)^2} \longrightarrow 0 \quad$ and $\quad x_m \longrightarrow \dfrac{rm}{M},$

thus, $\quad 3.3 \text{ mm} = r\left(\dfrac{15}{100}\right) \qquad r = 22 \text{ mm} \blacktriangleleft$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 19.115

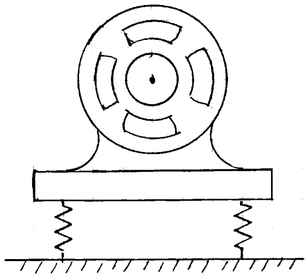
A motor of weight 40 lb is supported by four springs, each of constant 225 lb/in. The motor is constrained to move vertically, and the amplitude of its motion is observed to be 0.05 in. at a speed of 1200 rpm. Knowing that the weight of the rotor is 9 lb, determine the distance between the mass center of the rotor and the axis of the shaft.

SOLUTION



W = 40 lb

Four springs each of constant 225 lb/in.

We note that the motor is constrained to move vertically.

$$4(225 \text{ lb/in.}) = 900 \text{ lb/in.} = 10800 \text{ lb/ft}$$

$$\omega_n = \sqrt{\frac{k}{m}} = \sqrt{\frac{10800 \text{ lb/ft}}{(40 \text{ lb}/32.2)}} = 93.242 \text{ rad/s}$$

For $\omega = 1200 \text{ rpm} = 125.664 \text{ rad/s}$ we have

$$x_m = 0.05 \text{ in.} = 4.1667 \times 10^{-3} \text{ ft}$$

Eq. (19.33):

$$x_m = \frac{\frac{P_m}{k}}{1 - \left(\frac{\omega}{\omega_n}\right)^2}$$

Thus:

$$\frac{P_m}{k} = x_m \left[1 - \left(\frac{\omega}{\omega_n}\right)^2\right]$$

$$= (4.1667 \times 10^{-3} \text{ ft})\left[1 - \left(\frac{125.664}{93.242}\right)^2\right] = -3.4015 \times 10^{-3} \text{ ft (out of phase)}$$

$$P_m = (10800 \text{ lb/ft})(3.4015 \times 10^{-3} \text{ ft}) = 36.736 \text{ lb}$$

We have found: $P_m = 36.736$ lb

For an unbalanced rotor of weight $W_R = 9$ lb, rotating at $\omega = 1200 \text{ rpm} = 125.664 \text{ rad/s}$, with the mass center at a distance $\bar{r}$ from the axis of rotation, we have,

$$P_m = m_R \bar{r} \omega^2$$

$$\bar{r} = \frac{P_m}{m_R \omega^2} = \frac{36.736 \text{ lb}}{(9 \text{ lb}/32.2)(125.664 \text{ rad/s})^2} = 8.3231 \times 10^{-3} \text{ ft}$$

$\bar{r} = 0.0999$ in. ◀

If you are a student using this Manual, you are using it without permission.*

PROBLEM 19.116

A motor weighing 400 lb is supported by springs having a total constant of 1200 lb/in. The unbalance of the rotor is equivalent to a 1-oz weight located 8 in. from the axis of rotation. Determine the range of allowable values of the motor speed if the amplitude of the vibration is not to exceed 0.06 in.

SOLUTION

Let M = mass of motor, m = unbalance mass, r = eccentricity

$$M = \frac{400}{32.2} = 12.4224 \text{ lb}\cdot\text{s}^2/\text{ft}$$

$$m = \left(\frac{1}{16}\right)\left(\frac{1}{32.2}\right) = 0.001941 \text{ lb}\cdot\text{s}^2/\text{ft}$$

$$r = 8 \text{ in.} = 0.66667 \text{ ft} \quad k = 1200 \text{ lb/in.} = 14,400 \text{ lb/ft}$$

Natural circular frequency:
$$\omega_n = \sqrt{\frac{k}{M}} = \sqrt{\frac{14,400}{12.4224}} = 34.047 \text{ rad/s}$$

$$\frac{rm}{M} = \frac{(0.66667)(0.001941)}{12.4224}$$
$$= 0.00014017 \text{ ft} = 0.00125 \text{ in.}$$

From the derivation given in Problem 19.113,

$$x_m = \frac{\left(\frac{rm}{M}\right)\left(\frac{\omega_f}{\omega_n}\right)^2}{1-\left(\frac{\omega_f}{\omega_n}\right)^2} = \frac{0.00125\left(\frac{\omega_f}{\omega_n}\right)^2}{1-\left(\frac{\omega_f}{\omega_n}\right)^2} \text{ in.}$$

In phase motion with $|x_m| < 0.06$ in.

$$\frac{0.00125\left(\frac{\omega_f}{\omega_n}\right)^2}{1-\left(\frac{\omega_f}{\omega_n}\right)^2} < 0.06$$

$$0.00125\left(\frac{\omega_f}{\omega_n}\right)^2\left(\frac{\omega_f}{\omega_n}\right)^2 < 0.06 - 0.06\left(\frac{\omega_f}{\omega_n}\right)^2$$

$$0.06125\left(\frac{\omega_f}{\omega_n}\right)^2 < 0.06$$

$$\frac{\omega_f}{\omega_n} < \sqrt{\frac{0.06}{0.06125}} = 0.98974$$

$$\omega_f < (0.98974)(34.047) = 33.698 \text{ rad/s}$$

$\omega_f < 322$ rpm ◀

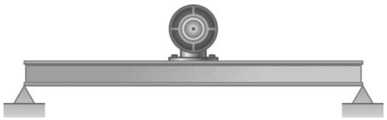
PROBLEM 19.117



A 180-kg motor is bolted to a light horizontal beam. The unbalance of its rotor is equivalent to a 28-g mass located 150 mm from the axis of rotation, and the static deflection of the beam due to the weight of the motor is 12 mm. The amplitude of the vibration due to the unbalance can be decreased by adding a plate to the base of the motor. If the amplitude of vibration is to be less than 60 μm for motor speeds above 300 rpm, determine the required mass of the plate.

SOLUTION

Before the plate is added, $M_1 = 180 \text{ kg}, \quad m = 28\times 10^{-3} \text{ kg}$

$$r = 150 \text{ mm} = 0.150 \text{ m}$$

Equivalent spring constant: $k = \dfrac{W_1}{\delta_{st}} = \dfrac{M_1 g}{\delta_{st}}$

$$k = \frac{(180)(9.81)}{12\times 10^{-3}} = 147.15\times 10^3 \text{ N/m}$$

Let M_2 be the mass of motor plus the plate.

Natural circular frequency. $\omega_n = \sqrt{\dfrac{k}{M_2}}$

Forcing frequency: $\omega_f = 300 \text{ rpm} = 31.416 \text{ rad/s}$

$$\left(\frac{\omega_f}{\omega_n}\right)^2 = \frac{\omega_f^2 M_2}{k} = \frac{(31.416)^2 M_2}{147.15\times 10^3} = 0.006707 M_2$$

From the derivation in Problem 19.113,

$$x_m = \frac{\left(\frac{rm}{M_2}\right)\left(\frac{\omega_f}{\omega_n}\right)^2}{1-\left(\frac{\omega_f}{\omega_n}\right)^2}$$

For out of phase motion with $x_m = -60\times 10^{-6}$ m,

$$-60\times 10^{-6} = \frac{\left[\frac{(0.150)(28\times 10^{-3})}{M_2}\right](0.006707 M_2)}{1-0.006707 M_2}$$

$$-60\times 10^{-6} + (60\times 10^{-6})(0.006707) M_2 = 28.170\times 10^{-6}$$

$$402.49\times 10^{-9} M_2 = 88.170\times 10^{-6}$$

$$M_2 = 219.10 \text{ kg}$$

Added mass: $\Delta M = M_2 - M_1 = 219.10 - 180$ $\quad \Delta M = 39.1 \text{ kg}$ ◀

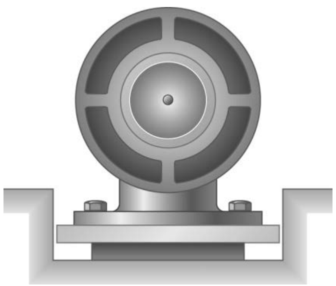
PROBLEM 19.118



The unbalance of the rotor of a 400-lb motor is equivalent to a 3-oz weight located 6 in. from the axis of rotation. In order to limit to 0.2 lb the amplitude of the fluctuating force exerted on the foundation when the motor is run at speeds of 100 rpm and above, a pad is to be placed between the motor and the foundation. Determine (*a*) the maximum allowable spring constant *k* of the pad, (*b*) the corresponding amplitude of the fluctuating force exerted on the foundation when the motor is run at 200 rpm.

SOLUTION

Mass of motor. $M = \frac{400}{32.2} = 12.422 \text{ lb} \cdot \text{s}^2/\text{ft}$

Unbalance mass. $m = \left(\frac{3}{16}\right)\left(\frac{1}{32.2}\right) = 0.005823 \text{ lb} \cdot \text{s}^2/\text{ft}$

Eccentricity. $r = 6 \text{ in.} = 0.5 \text{ ft}$

Equation of motion: $M\ddot{x} + kx = P_m \sin \omega_f t = mr\omega_f^2 \sin \omega_f t$

$$(-M\omega_f^2 + k)x_m = mr\omega_f^2$$

$$x_m = \frac{mr\omega_f^2}{k - M\omega_f^2}$$

Transmitted force. $F_m = kx_m = \frac{kmr\omega_f^2}{k - M\omega_f^2}$

For out of phase motion, $|F_m| = \frac{kmr\omega_f^2}{M\omega_f^2 - k}$ (1)

(*a*) Required value of *k*.

Solve Eq. (1) for *k*. $|F_m|(M\omega_f^2 - k) = kmr\omega_f^2$

$$k(mr\omega_f^2 + |F_m|) = |F_m| M\omega_f^2$$

$$k = \frac{|F_m| M\omega_f^2}{mr\omega_f^2 + |F_m|}$$

Data: $|F_m| = 0.2 \text{ lb}$ $\omega_f = 100 \text{ rpm} = 10.472 \text{ rad/s}$

$$k = \frac{(0.2)(12.422)(10.472)^2}{(0.005823)(0.5)(10.472)^2 + 0.2} = 524.65$$

$k = 525 \text{ lb/ft}$ ◀

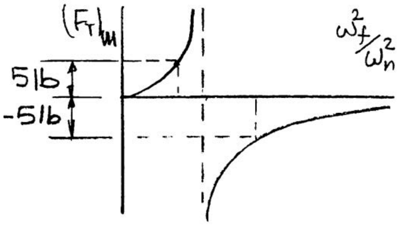
PROBLEM 19.120

A 360-lb motor is supported by springs of total constant 12.5 kips/ft. The unbalance of the rotor is equivalent to a 0.9-oz weight located 7.5 in. from the axis of rotation. Determine the range of speeds of the motor for which the amplitude of the fluctuating force exerted on the foundation is less than 5 lb.

SOLUTION



From Problem 19.113
$$x_m = \frac{r\left(\frac{m}{M}\right)\left(\frac{\omega_f}{\omega_n}\right)^2}{1-\left(\frac{\omega_f}{\omega_n}\right)^2}$$

And
$$(F_T)_m = kx_m, \quad \frac{k}{M} = \omega_n^2, \quad (F_T)_m = \frac{rm\omega_f^2}{\left[1-\left(\frac{\omega_f}{\omega_n}\right)^2\right]}$$

Then
$$rm = \left(\frac{7.5}{12}\text{ ft}\right)\left(\frac{\left(\frac{0.9}{16}\text{ lb}\right)}{32.2\text{ ft/s}^2}\right) = 0.0010918\text{ lb}\cdot\text{s}^2$$

$$\omega_n^2 = \frac{k}{M} = \frac{12500\text{ lb/ft}}{\frac{360\text{ lb}}{32.2\text{ ft/s}^2}} = 1118.1\text{ s}^{-2}$$

$$(F_T)_m = (0.0010918\text{ lb}\cdot\text{s}^2)\frac{\omega_f^2}{1-\frac{\omega_f^2}{1118.1}}$$

or
$$(F_T)_m\left[1-\frac{\omega_f^2}{1118.1}\right] = (0.0010918\text{ lb}\cdot\text{s}^2)\omega_f^2$$

$$(F_T)_m = \left[\frac{(F_T)_m}{1118.1} + (0.0010918)\right]\omega_f^2$$

Then
$$\omega_f^2 = \frac{1118.1(F_T)_m}{(F_T)_m + 1.2207}$$

(*a*)
$$(F_T)_m = +5: \quad \omega_f^2 = \frac{1118.1(5)}{5+1.2207} = 898.69\text{ s}^{-2},$$

$$\omega_f \le 29.978\text{ rad/s}$$

$$\le 286.26\text{ rpm} \qquad \omega_f \le 286\text{ rpm} \blacktriangleleft$$

(*b*)
$$(F_T)_m = -5: \quad \omega_f^2 = \frac{1118.1\,(-5)}{-5+1.2207} = 1479.2\text{ s}^{-2},$$

$$\omega_f > 38.461\text{ rad/s}$$

$$> 367.27\text{ rpm} \qquad \omega_f > 367\text{ rpm} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. PROBLEM 19.121

Figures (1) and (2) show how springs can be used to support a block in two different situations. In Figure (1), they help decrease the amplitude of the fluctuating force transmitted by the block to the foundation. In Figure (2), they help decrease the amplitude of the fluctuating displacement transmitted by the foundation to the block. The ratio of the transmitted force to the impressed force or the ratio of the transmitted displacement to the impressed displacement is called the *transmissibility*. Derive an equation for the transmissibility for each situation. Give your answer in terms of the ratio ω_f/ω_n of the frequency ω_f of the impressed force or impressed displacement to the natural frequency ω_n of the spring-mass system. Show that in order to cause any reduction in transmissibility, the ratio ω_f/ω_n must be greater than $\sqrt{2}$.

SOLUTION

(1) From Equation (19.33):

$$x_m = \frac{\frac{P_m}{k}}{1-\left(\frac{\omega_f}{\omega_n}\right)^2}$$

Force transmitted:

$$(P_T)_m = kx_m = k\left[\frac{\frac{P_m}{k}}{1-\left(\frac{\omega_f}{\omega_n}\right)^2}\right]$$

Thus,

$$\text{Transmissibility} = \frac{(P_T)_m}{P_m} = \frac{1}{1-\left(\frac{\omega_f}{\omega_n}\right)^2} \blacktriangleleft$$

(2) From Equation (19.33′):

Displacement transmitted:

$$x_m = \frac{\delta_m}{1-\left(\frac{\omega_f}{\omega_n}\right)^2}$$

$$\text{Transmissibility} = \frac{x_m}{\delta_m} = \frac{1}{1-\left(\frac{\omega_f}{\omega_n}\right)^2} \blacktriangleleft$$

For $\frac{(P_T)_m}{P_m}$ or $\frac{x_m}{\delta_m}$ to be less than 1,

$$\frac{1}{\left|1-\left(\frac{\omega_f}{\omega_n}\right)^2\right|} < 1$$

$$1 < \left|1-\left(\frac{\omega_f}{\omega_n}\right)^2\right|$$

$$\left(\frac{\omega_f}{\omega_n}\right)^2 > 2$$

$$\frac{\omega_f}{\omega_n} > \sqrt{2} \quad \text{Q.E.D.} \blacktriangleleft$$

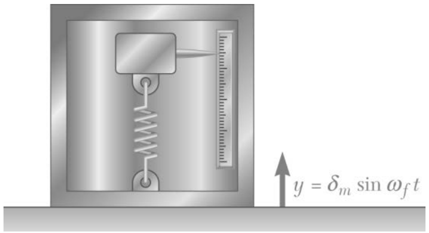
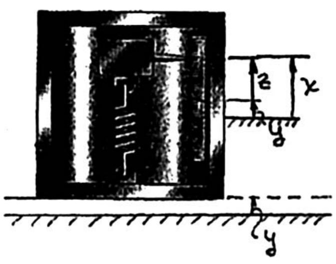
PROBLEM 19.122



A vibrometer used to measure the amplitude of vibrations consists essentially of a box containing a mass-spring system with a known natural frequency of 120 Hz. The box is rigidly attached to a surface, which is moving according to the equation $y = \delta_m \sin \omega_f t$. If the amplitude z_m of the motion of the mass relative to the box is used as a measure of the amplitude δ_m of the vibration of the surface, determine (*a*) the percent error when the frequency of the vibration is 600 Hz, (*b*) the frequency at which the error is zero.

SOLUTION



$$x = \left(\frac{\delta_m}{1 - \frac{\omega_f^2}{\omega_n^2}} \right) \sin \omega_f t$$

$$y = \delta_m \sin \omega_f t$$

$z =$ relative motion

$$z = x - y = \left[\frac{\delta_m}{1 - \frac{\omega_f^2}{\omega_n^2}} - \delta_m \right] \sin \omega_f t$$

$$z_m = \delta_m \left[\frac{1}{1 - \frac{\omega_f^2}{\omega_n^2}} - 1 \right] = \frac{\delta_m \frac{\omega_f^2}{\omega_n^2}}{1 - \frac{\omega_f^2}{\omega_n^2}}$$

(*a*)

$$\frac{z_m}{\delta_m} = \frac{\frac{\omega_f^2}{\omega_n^2}}{1 - \frac{\omega_f^2}{\omega_n^2}} = \frac{\left(\frac{600}{120}\right)^2}{1 - \left(\frac{600}{120}\right)^2} = \frac{25}{24} = 1.0417 \quad \blacktriangleleft$$

Error $= 4.17\%$

(*b*)

$$\frac{z_m}{\delta_m} = 1 = \frac{\frac{\omega_f^2}{\omega_n^2}}{1 - \frac{\omega_f^2}{\omega_n^2}}$$

$$1 = 2\frac{\omega_f^2}{\omega_n^2}$$

$$f_f = \frac{\sqrt{2}}{2} f_n = \frac{\sqrt{2}}{2}(120) = 84.853 \text{ Hz}$$

$f_n = 84.9$ Hz ◀

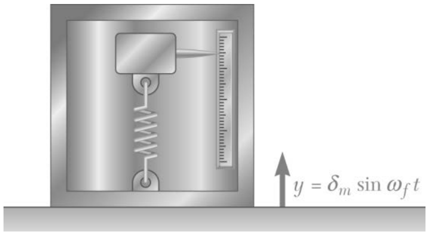
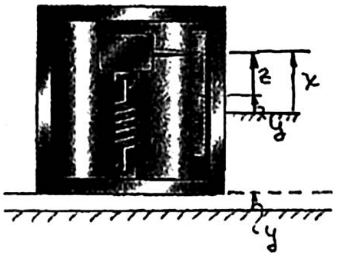
PROBLEM 19.123



A certain accelerometer consists essentially of a box containing a mass-spring system with a known natural frequency of 2200 Hz. The box is rigidly attached to a surface, which is moving according to the equation $y = \delta_m \sin \omega_f t$. If the amplitude z_m of the motion of the mass relative to the box times a scale factor ω_n^2 is used as a measure of the maximum acceleration $\alpha_m = \delta_m \omega_f^2$ of the vibrating surface, determine the percent error when the frequency of the vibration is 600 Hz.

SOLUTION



$$x = \left(\frac{\delta_m}{1 - \frac{\omega_f^2}{\omega_n^2}} \right) \sin \omega_f t$$

$$y = \delta_m \sin \omega_f t$$

$$z = \text{relative motion}$$

$$z = x - y = \left[\frac{\delta_m}{1 - \frac{\omega_f^2}{\omega_n^2}} - \delta_m \right] \sin \omega_f t$$

$$z_m = \delta_m \left[\frac{1}{1 - \frac{\omega_f^2}{\omega_n^2}} - 1 \right] = \frac{\delta_m \frac{\omega_f^2}{\omega_n^2}}{1 - \frac{\omega_f^2}{\omega_n^2}}$$

The actual acceleration is $a_m = -\omega_f^2 \delta_m$

The measurement is proportional to $z_m \omega_n^2$.

Then
$$\frac{z_m \omega_n^2}{a_m} = \frac{z_m}{\delta_m} \left(\frac{\omega_n}{\omega_f} \right)^2$$

$$= \frac{1}{1 - \left(\frac{\omega_f}{\omega_n} \right)^2}$$

$$= \frac{1}{1 - \left(\frac{600}{2200} \right)^2}$$

$$= 1.0804$$

Error $= 8.04\%$ ◀

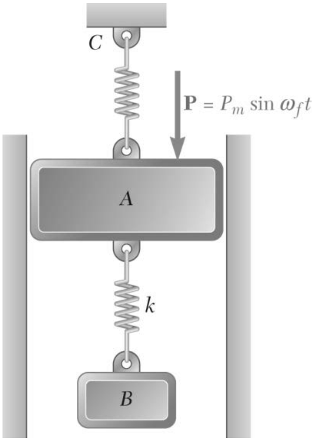
PROBLEM 19.124



Block A can move without friction in the slot as shown and is acted upon by a vertical periodic force of magnitude $P = P_m \sin \omega_f t$, where $\omega_f = 2$ rad/s and $P_m = 20$ N. A spring of constant k is attached to the bottom of block A and to a 22-kg block B. Determine (a) the value of the constant k which will prevent a steady-state vibration of block A, (b) the corresponding amplitude of the vibration of block B.

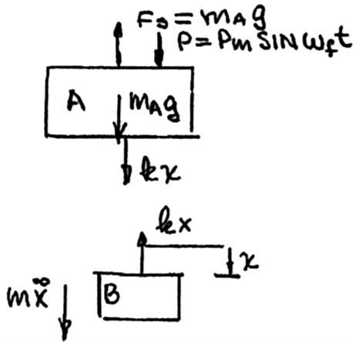
SOLUTION

In steady state vibration, block A does not move and therefore, remains in its original equilibrium position.

Block A: $+\downarrow \Sigma F = 0$

$$kx = -P_m \sin \omega_f t \qquad (1)$$

Block B: $+\downarrow \Sigma F = m_B \ddot{x}$



$$m_B \ddot{x} + kx = 0$$

$$x = x_m \sin \omega_n t$$

$$\omega_n^2 = k/m_B$$

From Eq. (1): $kx_m \sin \omega_n t = -P_m \sin \omega_f t$

$$\omega_n = \omega_f = 2 \text{ rad/s}$$

$$kx_m = -P_m$$

$$\omega_n = \sqrt{\frac{k}{m_B}}$$

$$k = m_B \omega_n^2$$

(a) Required spring constant. $k = (22)(2)^2$ $\qquad k = 88.0$ N/m ◀

(b) Corresponding amplitude of vibration of B.

$$kx_m = -P_m$$

$$x_m = -\frac{P_m}{k}$$

$$x_m = -\frac{20 \text{ N}}{88 \text{ N/m}} \qquad x_m = -0.227 \text{ m} ◀$$

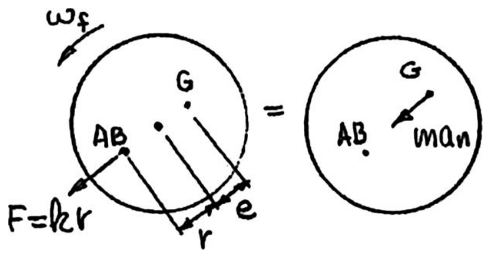
PROBLEM 19.125

A 60-lb disk is attached with an eccentricity $e = 0.006$ in. to the midpoint of a vertical shaft *AB*, which revolves at a constant angular velocity ω_f. Knowing that the spring constant *k* for horizontal movement of the disk is 40,000 lb/ft, determine (*a*) the angular velocity ω_f at which resonance will occur, (*b*) the deflection *r* of the shaft when $\omega_f = 1200$ rpm.

SOLUTION



G describes a circle about the axis *AB* of radius $r + e$.

Thus, $$a_n = (r+e)\omega_f^2$$

Deflection of the shaft is $$F = kr$$

Thus, $$F = ma_n$$

$$kr = m(r+e)\omega_f^2$$

$$\omega_n^2 = \frac{k}{m} \qquad m = \frac{k}{\omega_n^2}$$

$$\not{k}r = \frac{\not{k}}{\omega_n^2}(r+e)\omega_f^2$$

$$r = \frac{e\frac{\omega_f^2}{\omega_n^2}}{1 - \frac{\omega_f^2}{\omega_n^2}}$$

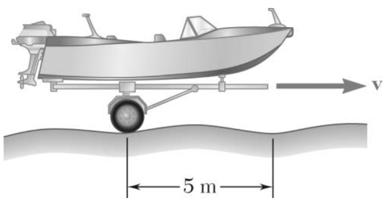
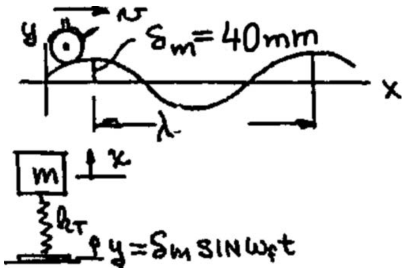
PROBLEM 19.126



A small trailer and its load have a total mass of 250-kg. The trailer is supported by two springs, each of constant 10 kN/m, and is pulled over a road, the surface of which can be approximated by a sine curve with an amplitude of 40 mm and a wavelength of 5 m (i.e., the distance between successive crests is 5 m and the vertical distance from crest to trough is 80 mm). Determine (*a*) the speed at which resonance will occur, (*b*) the amplitude of the vibration of the trailer at a speed of 50 km/h.

SOLUTION



Total spring constant $k = 2(10\times 10^3 \text{ N/m})$

$= 20\times 10^3 \text{ N/m}$

(*a*) $\omega_n^2 = \dfrac{k}{m} = \dfrac{20\times 10^3 \text{ N/m}}{250 \text{ kg}} = 80 \text{ s}^{-2}$

$\lambda = 5 \text{ m}$

$\delta_m = 40 \text{ mm} = 40\times 10^{-3} \text{ m}$

$$y = \delta_m \sin\frac{2\pi x}{\lambda} \quad \text{where} \quad x = vt$$

$$y = \delta_m \sin\omega_f t$$

$$\omega_f = \frac{2\pi v}{\lambda}$$

$$\delta_m = 40 \text{ mm} = 40\times 10^{-3} \text{ m}$$

From Equation (19.33′): $x_m = \dfrac{\delta_m}{\left(1-\frac{\omega_f^2}{\omega_n^2}\right)}$

Resonance: $\omega_f = \dfrac{2\pi v}{5} = \omega_n = \sqrt{80} \text{ s}^{-1},$

$v = 7.1176 \text{ m/s}$ $\qquad v = 25.6 \text{ km/h}$ ◀

(*b*) Amplitude at $v = 50 \text{ km/h} = 13.8889 \text{ m/s}$

$$\omega_f = \frac{2\pi(13.8889)}{5} = 17.4533 \text{ rad/s}$$

$$\omega_f^2 = 304.60 \text{ s}^{-2}$$

$x_m = \dfrac{40\times 10^{-3}}{1-\frac{304.62}{80}} = -14.246\times 10^{-3} \text{ m}$ $\qquad x_m = -14.25 \text{ mm}$ ◀

PROBLEM 19.127

Show that in the case of heavy damping $(c > c_c)$, a body never passes through its position of equilibrium O (a) if it is released with no initial velocity from an arbitrary position or (b) if it is started from O with an arbitrary initial velocity.

SOLUTION

Since $c > c_c$, we use Equation (19.42), where

$$\lambda_1 < 0, \ \lambda_2 < 0$$

$$x = C_1 e^{\lambda_1 t} + C_2 e^{\lambda_2 t} \tag{1}$$

$$v = \frac{dx}{dt} = C_1 \lambda_1 e^{\lambda_1 t} + C_2 \lambda_2 e^{\lambda_2 t} \tag{2}$$

(a) $\quad t = 0, \ x = x_0, \qquad v = 0:$

From Eqs. (1) and (2):

$$x_0 = C_1 + C_2$$

$$0 = C_1 \lambda_1 + C_2 \lambda_2$$

Solving for c_1 and c_2,

$$C_1 = \frac{\lambda_2}{\lambda_2 - \lambda_1} x_0$$

$$C_2 = \frac{-\lambda_1}{\lambda_2 - x_1} x_0$$

Substituting for C_1 and C_2 in Eq. (1), $\quad x = \dfrac{x_2}{\lambda_2 - \lambda_1}\left[\lambda_2 e^{\lambda_1 t} - \lambda_1 e^{\lambda_2 t}\right]$

For $x = 0$: when $t \neq \infty$, we must have

$$\lambda_1 e^{\lambda_2 t} - \lambda_2 e^{\lambda_1 t} = 0 \qquad \frac{\lambda_2}{\lambda_1} = e^{(\lambda_2 - \lambda_1)t} \tag{3}$$

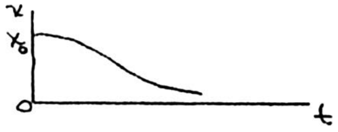
Recall that

$\lambda_1 < 0, \ \lambda_2 < 0.$ Choosing λ_1 and λ_2 so that $\lambda_1 < \lambda_2 < 0,$ we have

$$0 < \frac{\lambda_2}{\lambda_1} < 1 \quad \text{and} \quad \lambda_2 - \lambda_1 > 0$$

Thus a positive solution for $t > 0$ for Equation (3) cannot exist, since it would require that e raised to a positive power be less than 1, which is impossible. Thus, x is never 0.

The $x - t$ curve for this case is as shown.



◀

If you are a student using this Manual, you are using it without permission.*

(*b*) $t = 0,\ x = 0,\ v = v_0$: Equations (1) and (2) yield

$$0 = C_1 + C_2$$

$$v_0 = C_1\lambda_1 + C_2\lambda_2$$

Solving for C_1 and C_2,

$$C_1 = -\frac{v_0}{\lambda_2 - \lambda_1}$$

$$C_2 = \frac{v_2}{\lambda_2 - \lambda_1}$$

Substituting into Eq. (1),

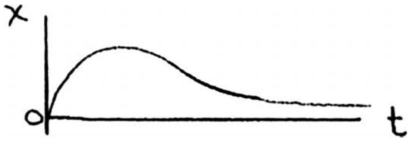
$$x = \frac{v_0}{\lambda_2 - \lambda_1}[e^{\lambda_2 t} - e^{\lambda_1 t}]$$

For $x = 0$, and $t > 0$

$$e^{\lambda_2 t} = e^{\lambda_1 t}$$

For $c > c_c$, $\lambda_1 \neq \lambda_2$; thus, no solution can exist for *t*, and *x* is never 0 when $t > 0$.

The $x - t$ curve for this motion is as shown.



◀

PROBLEM 19.128

Show that in the case of heavy damping $(c > c_c)$, a body released from an arbitrary position with an arbitrary initial velocity cannot pass more than once through its equilibrium position.

SOLUTION

Substitute the initial conditions, $t = 0, x = x_0, v = v_0$ in Equations (1) and (2) of Problem 19.127.

$$x_0 = C_1 + C_2 \qquad v_0 = C_1\lambda_1 + C_2\lambda_2$$

Solving for C_1 and C_2,

$$C_1 = -\frac{(v_0 - \lambda_2 x_0)}{\lambda_2 - \lambda_1}$$

$$C_2 = \frac{(v_0 - \lambda_1 x_0)}{\lambda_2 - \lambda_1}$$

And substituting in Eq. (1)

$$x = \frac{1}{\lambda_2 - \lambda_1}\left[(v_0 - \lambda_1 x_0)e^{\lambda_2 t} - (v_0 - \lambda_2 x_0)e^{\lambda_1 t}\right]$$

For $x = 0,\ t \neq \infty$:

$$(v_0 - \lambda_1 x_0)e^{\lambda_2 t} = (v_0 - \lambda_2 x_0)e^{\lambda_1 t}$$

$$e^{(\lambda_2 - \lambda_1)t} = \frac{(v_0 - \lambda_2 x_0)}{(v_0 - \lambda_1 x_0)}$$

$$t = \frac{1}{(\lambda_2 - \lambda_1)}\ln\frac{v_0 - \lambda_2 x_0}{v_0 - \lambda_1 x_0}$$

This defines one value of t only for $x = 0$, which will exist if the argument of the natural logarithm is positive,

i.e., if $\frac{v_0 - \lambda_2 x_0}{v_0 - \lambda_1 x_0} > 1$. Assuming $\lambda_1 < \lambda_2 < 0$,

this occurs if $v_0 < \lambda_1 x_0$.

If you are a student using this Manual, you are using it without permission.*

PROBLEM 19.129

In the case of light damping, the displacements $x_1,\ x_2,\ x_3,$ shown in Figure 19.11 may be assumed equal to the maximum displacements. Show that the ratio of any two successive maximum displacements x_n and x_{n+1} is a constant and that the natural logarithm of this ratio, called the *logarithmic decrement*, is

$$\ln\frac{x_n}{x_{n+1}} = \frac{2\pi(c/c_c)}{\sqrt{1-(c/c_c)^2}}$$

SOLUTION

For light damping,

Equation (19.46): $x = x_0 e^{-\left(\frac{c}{2m}\right)t}\sin(\omega_0 t + \phi)$

At given maximum displacement, $t = t_n,\ x = x_n$

$$\sin(\omega_0 t_n + \phi) = 1$$

$$x_n = x_0 e^{-\left(\frac{c}{2m}\right)t_n}$$

At next maximum displacement, $t = t_{n+1},\ x = x_{n+1}$

$$\sin(\omega_0 t_{n+1} + \phi) = 1$$

$$x_{n+1} = x_0 e^{-\left(\frac{c}{2m}\right)t_{n+1}}$$

But $\omega_D t_{n+1} - \omega_D t_n = 2\pi$

$$t_{n+1} - t_n = \frac{2\pi}{\omega_D}$$

Ratio of successive displacements: $\dfrac{x_n}{x_{n+1}} = \dfrac{x_0 e^{-\frac{c}{2m}t_n}}{x_0 e^{-\frac{c}{2m}t_{n+1}}}$

$$= e^{-\frac{c}{2m}(t_n - t_{n+1})} = e^{+\frac{c}{2m}\frac{2\pi}{\omega_D}}$$

Thus, $$\ln\frac{x_n}{x_{n+1}} = \frac{c\pi}{m\omega_D} \qquad (1)$$

From Equations (19.45) and (19.41): $\omega_D = \omega_n\sqrt{1-\left(\dfrac{c}{c_c}\right)^2}$

$$\omega_D = \frac{c_c}{2m}\sqrt{1-\left(\frac{c}{c}\right)^2}$$

Thus, $$\ln\frac{x_n}{x_{n+1}} = \frac{c\pi}{m}\frac{2m}{c_c}\frac{1}{\sqrt{1-\left(\frac{c}{c_c}\right)^2}}$$

$$\ln\frac{x_n}{x_{n+1}} = \frac{2\pi\left(\frac{c}{c_c}\right)}{\sqrt{1-\left(\frac{c}{c_c}\right)^2}} \quad \text{Q.E.D.} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 19.130

In practice, it is often difficult to determine the logarithmic decrement of a system with light damping defined in Problem 19.129 by measuring two successive maximum displacements. Show that the logarithmic decrement can also be expressed as $(1/k)\ln(x_n/x_{n+k})$, where k is the number of cycles between readings of the maximum displacement.

SOLUTION

As in Problem 19.129, for maximum displacements x_n and x_{n+k} at t_n and t_{n+k}, $\sin(\omega_0 t_n + \phi) = 1$

and $\sin(\omega_n t_{n+k} + \phi) = 1$.

$$x_n = x_0 e^{-\left(\frac{c}{2m}\right)t_n}$$

$$x_{n+k} = x_0 e^{-\left(\frac{c}{2m}\right)(t_{n+k})}$$

Ratio of maximum displacements:

$$\frac{x_n}{x_{n+k}} = \frac{x_0 e^{\left(\frac{-c}{2m}\right)t_n}}{x_0 e^{\left(\frac{-c}{2m}\right)t_{n+k}}} = e^{\frac{-c}{2m}(t_n - t_{n+k})}$$

But

$$\omega_D t_{n+k} - \omega_D t_n = k(2\pi)$$

$$t_n - t_{n+k} = k\frac{2\pi}{\omega_D}$$

Thus,

$$\frac{x_n}{x_{n+k}} = +\frac{c}{2m}\left(\frac{2k\pi}{\omega_D}\right)$$

$$\ln\frac{x_n}{x_{n+k}} = k\frac{c\pi}{m\omega_D} \qquad (2)$$

But from Problem 19.129, Equation (1):

$$\text{log decrement} = \ln\frac{x_n}{x_{n+1}} = \frac{c\pi}{m\omega_D}$$

Comparing with Equation (2),

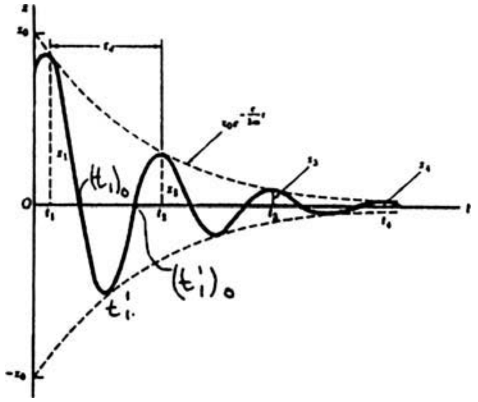
$$\text{log decrement} = \frac{1}{k}\ln\frac{x_n}{x_{n+k}} \quad \text{Q.E.D.} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 19.131

In a system with light damping $(c < c_c)$, the period of vibration is commonly defined as the time interval $\tau_d = 2\pi/\omega_d$ corresponding to two successive points where the displacement-time curve touches one of the limiting curves shown in Figure 19.11. Show that the interval of time (*a*) between a maximum positive displacement and the following maximum negative displacement is $\frac{1}{2}\tau_d$, (*b*) between two successive zero displacements is $\frac{1}{2}\tau_d$, (*c*) between a maximum positive displacement and the following zero displacement is greater than $\frac{1}{4}\tau_d$.

SOLUTION



Equation (19.46): $x = x_0 e^{-\left(\frac{c}{2m}\right)t} \sin(\omega_d t + \phi)$

(*a*) Maxima (positive or negative) when $\dot{x} = 0$:

$$\dot{x} = x_0 \left(\frac{-c}{2m}\right) e^{-\left(\frac{c}{2m}\right)t} \sin(\omega_d t + \phi) + x_0 \omega_d e^{-\left(\frac{c}{2m}\right)t} \cos(\omega_d t + \phi)$$

Thus, zero velocities occur at times when

$$\dot{x} = 0, \quad \text{or} \quad \tan(\omega_d t + \phi) = \frac{2m\omega_d}{c} \tag{1}$$

The time to the first zero velocity, t_1, is

$$t_1 = \frac{\left[\tan^{-1}\left(\frac{2m\omega_d}{c}\right) - \phi\right]}{\omega_d} \tag{2}$$

The time to the next zero velocity where the displacement is negative is

$$t_1' = \frac{\left[\tan^{-1}\left(\frac{2m\omega_d}{c}\right) - \phi + \pi\right]}{\omega_d} \tag{3}$$

Subtracting Eq. (2) from Eq. (3),

$$t_1' - t_1 = \frac{\pi}{\omega_d} = \frac{\pi \cdot \tau_d}{2\pi} = \frac{\tau_d}{2} \quad \text{Q.E.D.}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

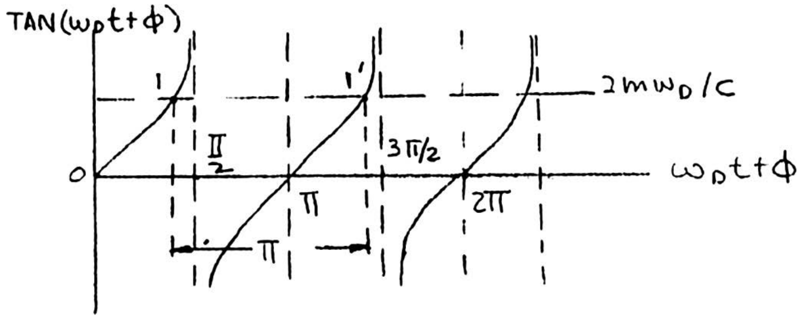
(*b*) Zero displacements occur when

$$\sin(\omega_\theta t + \phi) = 0 \quad \text{or at intervals of}$$

$$\omega_d t + \phi = \pi,\ 2\pi\ n\pi$$

Thus, $$\frac{(t_1)_0 = (\pi - \phi)}{\omega_d} \quad \text{and} \quad (t_1')_0 = \frac{(2\pi - \phi)}{\omega_d}$$

Time between $$0_s' = (t_1')_0 - (t_1)_0 = \frac{2\pi - \pi}{\omega_d} = \frac{\pi\tau_d}{2\pi} = \frac{\tau_d}{2} \quad \text{Q.E.D.}$$



Plot of Equation (1)

(*c*) The first maximum occurs at 1: $(\omega_d t_1 + \phi)$

The first zero occurs at $(\omega_d (t_1)_0 + \phi) = \pi$

From the above plot, $$(\omega_d (t_1)_0 + \phi) - (\omega_D t_1 + \phi) > \frac{\pi}{2}$$

or $$(t_1)_0 - t_1 > \frac{\pi}{2\omega_d} \quad (t_1)_0 - t_1 > \frac{\tau_d}{4} \quad \text{Q.E.D.}$$

Similar proofs can be made for subsequent maximum and minimum.

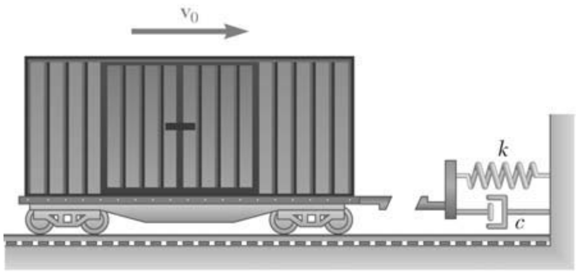
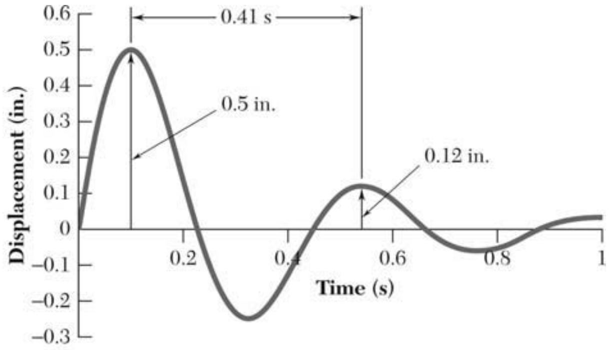
PROBLEM 19.132

A loaded railroad car weighing 30,000 lb is rolling at a constant velocity $\mathbf{v}_0$ when it couples with a spring and dashpot bumper system (Figure 1). The recorded displacement-time curve of the loaded railroad car after coupling is as shown (Figure 2). Determine (*a*) the damping constant, (*b*) the spring constant. (*Hint:* Use the definition of logarithmic decrement given in Problem 19.129.)



(1)



(2)

SOLUTION

Mass of railroad car:

$$m = \frac{W}{g} = \frac{30{,}000}{32.2}$$

$$= 931.67 \text{ lb}\cdot\text{s}^2/\text{ft}$$

The differential equation of motion for the system is

$$m\ddot{x} + c\dot{x} + kx = 0$$

For light damping, the solution is given by Eq. (19.44):

$$x = e^{-\left(\frac{c}{2m}\right)t}(C_1 \sin \omega_d t + C_2 \cos \omega_d t)$$

From the displacement versus time curve,

$$\tau_d = 0.41 \text{ s}$$

$$\omega_d = \frac{2\pi}{\tau_d} = \frac{2\pi}{0.41} = 15.325 \text{ rad/s}$$

At the first peak, $x_1 = 0.5$ in. and $t = t_1$.

At the second peak, $x_2 = 0.12$ in. and $t = t_1 + \tau_d$.

Forming the ratio $\frac{x_2}{x_1}$,

$$\frac{x_2}{x_1} = \frac{e^{-\left(\frac{c}{2m}\right)(t_1+\tau_d)}}{e^{-\left(\frac{c}{2m}\right)t_1}} = e^{-\left(\frac{c}{2m}\right)\tau_d} \quad (1)$$

$$\frac{x_1}{x_2} = e^{\frac{c\tau_d}{2m}}$$

PROBLEM 19.132 (Continued)

(*a*) Damping constant.

From Eq. (1):

$$\frac{c\tau_d}{2m} = \ln\left(\frac{x_1}{x_2}\right)$$

$$c = \frac{2m}{\tau_d}\ln\frac{x_1}{x_2}$$

$$= \frac{(2)(931.67)}{0.41}\ln\frac{0.5}{0.12}$$

$$= 6485.9 \text{ lb}\cdot\text{s/ft}$$

$c = 6.49 \text{ kip}\cdot\text{s/ft}$ ◀

(*b*) Spring constant.

Equation for ω_d:

$$\omega_d^2 = \frac{k}{m} - \left(\frac{c}{2m}\right)^2$$

$$k = m\omega_d^2 + \frac{c^2}{4m}$$

$$= (931.67)(15.325)^2 + \frac{(6485.9)^2}{(4)(931.67)}$$

$$= 230\times 10^3 \text{ lb/ft}$$

$k = 230 \text{ kips/ft}$ ◀

PROBLEM 19.133

A torsional pendulum has a centroidal mass moment of inertia of 0.3 kg-m^2 and when given an initial twist and released is found to have a frequency of oscillation of 200 rpm. Knowing that when this pendulum is immersed in oil and given the same initial condition it is found to have a frequency of oscillation of 180 rpm, determine the damping constant for the oil.

SOLUTION

Let the mass be rotated through the small angle θ from the equilibrium position.

Couples acting on the mass: Shaft: $-K\theta$

Oil: $-C\dot{\theta}$

Equation of motion: $\Sigma M = \bar{I}\ddot{\theta}: -K\theta - C\dot{\theta} = \bar{I}\ddot{\theta}$

$$\bar{I}\ddot{\theta} + C\dot{\theta} + K\theta = 0$$

Solution for light damping: $\theta = e^{-\lambda t}(C_1 \sin \omega_d t + C_2 \sin \omega_d t)$

where $\lambda = \dfrac{C}{2\bar{I}}$

$$\omega_n = \sqrt{\frac{K}{\bar{I}}}$$

$$\omega_d = \sqrt{\omega_n^2 - \lambda^2}$$

When there is no oil, assume $C \approx 0.$

$$\omega_n = 200 \text{ rpm} = 20.944 \text{ rad/s}$$

When oil is present,

$$\omega_d = 180 \text{ rpm} = 18.8496 \text{ rad/s}$$

$$\lambda = \sqrt{\omega_n^2 - \omega_d^2} = 9.1293 \text{ s}^{-1}$$

Damping constant for oil.

$$C = 2I\lambda = (2)(0.3 \text{ kg}\cdot\text{m}^2)(9.1293 \text{ s}^{-1})$$

$C = 5.48 \text{ N}\cdot\text{m}\cdot\text{s}$ ◀

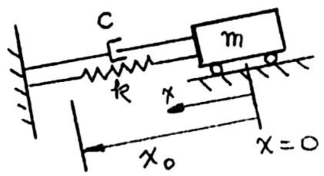
All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 19.134

The barrel of a field gun weighs 1500 lb and is returned into firing position after recoil by a recuperator of constant $c = 1100$ lb·s/ft. Determine (*a*) the constant k which should be used for the recuperator to return the barrel into firing position in the shortest possible time without any oscillation, (*b*) the time needed for the barrel to move back two-thirds of the way from its maximum-recoil position to its firing position.

SOLUTION

(*a*) A critically damped system regains its equilibrium position in the shortest time.



$$c = c_c = 1100 = 2m\sqrt{\frac{k}{m}}$$

Then $$k = \frac{\left(\frac{c_c}{2}\right)^2}{m} = \frac{\left(\frac{1100}{2}\right)^2}{\frac{1500 \text{ lb}}{32.2 \text{ ft/s}^2}} = 6494 \text{ lb/ft}$$ $k = 6490$ lb/ft ◀

(*b*) For a critically damped system, Equation (19.43):

$$x = (C_1 + C_2 t)e^{-\omega_n t}$$

We take $t = 0$ at maximum deflection x_0.

Thus, $$\dot{x}(0) = 0$$
$$x(0) = x_0$$

Using the initial conditions, $x(0) = x_0 = (C_1 + 0)e^0$, so $C_1 = x_0$

$$x = (x_0 + C_2 t)e^{-\omega_n t}$$

and $$\dot{x} = -\omega_n (x_0 + C_2 t)e^{-\omega_n t} + C_2 e^{-\omega_n t}$$
$$\dot{x}(0) = 0 = -\omega_n x_0 + C_2, \quad \text{so } C_2 = \omega_n x_0$$

Thus, $$x = x_0(1 + \omega_n t)e^{-\omega_n t}$$

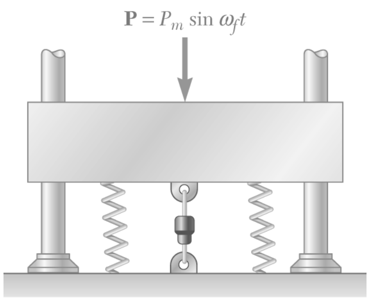
For $$x = \frac{x_0}{3}, \quad \frac{1}{3} = (1 + \omega_n t)e^{-\omega_n t}$$

Solving by trial for $\omega_n t$ gives: $\omega_n t = 2.289$

But $$\omega_n = \sqrt{\frac{k}{m}} = \sqrt{\frac{6494 \text{ lb/ft}}{\left(\frac{1500 \text{ lb}}{32.2 \text{ ft/s}^2}\right)}} = 11.807 \text{ s}^{-1}$$

Then $$t = \frac{\omega_n t}{\omega_n} = \frac{2.289}{11.807} = 0.19387$$ $t = 0.1939$ s ◀

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



PROBLEM 19.135

A platform of weight 200 lb, supported by two springs each of constant k = 250 lb/in., is subjected to a periodic force of maximum magnitude equal to 125 lb. Knowing that the coefficient of damping is 12 lb·s/in., determine (*a*) the natural frequency in rpm of the platform if there were no damping, (*b*) the frequency in rpm of the periodic force corresponding to the maximum value of the magnification factor, assuming damping, (*c*) the amplitude of the actual motion of the platform for each of the frequencies found in parts *a* and *b*.

SOLUTION

(*a*) *No Damping*:

$$k = 2(250 \text{ lb/in.}) = 500 \text{ lb/in.} = 6000 \text{ lb/ft}$$

$$\omega_n = \sqrt{\frac{k}{m}} = \sqrt{\frac{6000 \text{ lb/ft}}{(2000 \text{ lb})/(32.2 \text{ ft/s}^2)}} = 31.08 \text{ rad/s}$$

$$f = 4.947 \text{ Hz}$$

$$f = 297 \text{ rpm} \blacktriangleleft$$

(*b*) *Damped Motion*:

$$c = 12 \text{ lb}\cdot\text{s/in.} = 144 \text{ lb}\cdot\text{s/ft}$$

$$c_c = 2m\omega_n = (2)\left(\frac{200}{32.2}\right)(31.08) = 386.09 \text{ lb}\cdot\text{s/ft}$$

$$\frac{c}{c_c} = \frac{144 \text{ lb}\cdot\text{s/ft}}{386.09 \text{ lb}\cdot\text{s/ft}} = 0.37297$$

From Eq. (19.53):

$$\frac{x_m}{\delta_m} = \frac{1}{\sqrt{\left[1 - \left(\frac{\omega}{\omega_n}\right)^2\right]^2 + \left[2\frac{c}{c_c}\left(\frac{\omega}{\omega_n}\right)\right]^2}}$$

For maximum amplitude we set equal to zero the derivative with respect to $\left(\dfrac{\omega}{\omega_n}\right)$ of the square of the denominator.

$$2\left[1 - \left(\frac{\omega}{\omega_n}\right)^2\right]\left[-2\left(\frac{\omega}{\omega_n}\right)\right] + 8\left(\frac{c}{c_c}\right)^2\left(\frac{\omega}{\omega_n}\right) = 0$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

Rearranging, we obtain

$$4\left(\frac{\omega}{\omega_n}\right)\left[\left(\frac{\omega}{\omega_n}\right)^2 - 1 + 2\left(\frac{c}{c_c}\right)^2\right] = 0$$

$$\left(\frac{\omega}{\omega_n}\right)^2 = 1 - 2\left(\frac{c}{c_c}\right)^2$$

$$\left(\frac{\omega}{\omega_n}\right)^2 = 1 - 2\left(\frac{c}{c_c}\right)^2 = 1 - 2(0.37297)^2 = 0.72179$$

$$\frac{\omega}{\omega_n} = 0.84958 \qquad \omega = (0.84958)\omega_n = (0.84958)(31.08 \text{ rad/s})$$

$$\omega = 26.405 \text{ rad/s} \qquad f = 4.2025 \text{ Hz}$$

$f = 252$ rpm ◀

(*c*) *Amplitude*:

From Eq. (19.53):

$$x_m = \frac{\frac{P_m}{k}}{\sqrt{\left[1 - \left(\frac{\omega}{\omega_n}\right)^2\right]^2 + \left[2\left(\frac{c}{c_c}\right)\left(\frac{\omega}{\omega_n}\right)\right]^2}}$$

For part (*a*) with $P_m = 125$ lb and $\omega = \omega_n$

$$x_m = \frac{\frac{125 \text{ lb}}{6000 \text{ lb/ft}}}{\sqrt{[1-1]^2 + [2(0.37297)(1)]^2}} = 0.02793 \text{ ft}$$

$x_m = 0.335$ in. ◀

For part (*b*) with $P_m = 125$ lb and $\left(\frac{\omega}{\omega_n}\right) = 0.84958$

$$x_m = \frac{\frac{125 \text{ lb}}{6000 \text{ lb/ft}}}{\sqrt{[1 - (0.84958)^2]^2 + [2(0.84958)(0.37297)]^2}} = 0.0301 \text{ ft}$$

$x_m = 0.361$ in. ◀

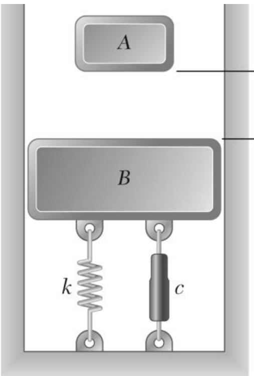
PROBLEM 19.136



A 4-kg block A is dropped from a height of 800 mm onto a 9-kg block B which is at rest. Block B is supported by a spring of constant $k = 1500$ N/m and is attached to a dashpot of damping coefficient $c = 230$ N·s/m. Knowing that there is no rebound, determine the maximum distance the blocks will move after the impact.

SOLUTION

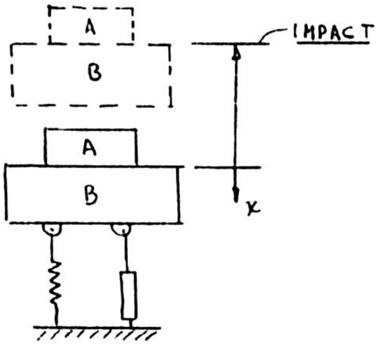
Velocity of Block A just before impact.

$$v_A = \sqrt{2gh}$$
$$= \sqrt{2(9.81)(0.8)}$$
$$= 3.962 \text{ m/s}$$

Velocity of Blocks A and B immediately after impact.

Conservation of momentum.

$$m_A v_A + m_B v_B = (m_A + m_B)v'$$
$$(4)(3.962) + 0 = (4+9)v'$$
$$v' = 1.219 \text{ m/s}$$
$$\dot{x}_0 = +1.219 \text{ m/s} \downarrow = \dot{x}_0$$



Static deflection (Block A): $x_0 = -\dfrac{m_A g}{k}$

$$= -\frac{(4)(9.82)}{1500}$$
$$= -0.02619 \text{ m}$$

$x = 0$, Equilibrium position for both blocks:

$$c_c = 2\sqrt{km}$$
$$= 2\sqrt{(1500)(13)}$$
$$= 279.3 \text{ N}\cdot\text{s/m}$$

Since $c < c_c$, Equation (19.44): $x = e^{-\left(\frac{c}{2m}\right)t}[C_1 \sin \omega_d t + C_2 \cos \omega_d t]$

$$\frac{c}{2m} = \frac{230}{(2)(13)}$$
$$= 8.846 \text{ s}^{-1}$$

PROBLEM 19.137 (Continued)

where $W_{AB}x = -W_{AB}\dfrac{l}{2}\sin\theta$

$= (29.43 \text{ N})(0.2 \text{ m}) \sin\theta$

$= 5.886 \sin\theta \text{ N}\cdot\text{m}$

$\approx -5.886\,\theta$

Damping force: $F_d = cr\dot{\theta}$

$$F_d r = cr^2\dot{\theta} = (9 \text{ N}\cdot\text{s}\cdot\text{m})(0.100 \text{ m})^2\dot{\theta} = 0.09\,\dot{\theta} = C\dot{\theta}$$

Inertia: $\bar{I}_{\text{disk}} + \bar{I}_{AB} + m_{AB}\left(\dfrac{l}{2}\right)^2 = 0.025 + 0.040 + (3)(0.2)^2 = 0.185 \text{ kg}\cdot\text{m}^2$

$$-5.886\theta - 0.09\dot{\theta} = 0.185\ddot{\theta}$$

$$0.185\ddot{\theta} + 0.09\dot{\theta} + 5.886\theta = 0$$

$$M\ddot{\theta} + C\dot{\theta} + K\theta = 0$$

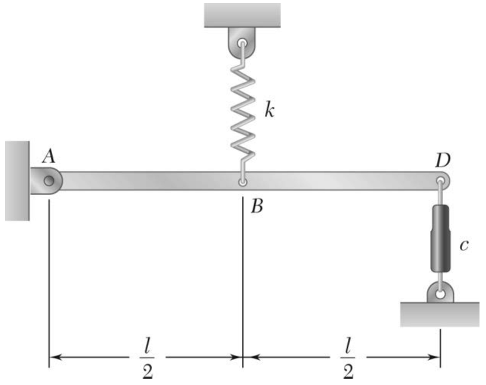
$$\omega_n = \sqrt{\frac{K}{M}} = \sqrt{\frac{5.886}{0.185}} = 5.6406 \text{ rad/s}$$

$$C_c = 2\,M\omega_2 = (2)(0.185)(5.6406) = 2.087$$

$$\frac{c}{c_c} = \frac{C}{C_c} = \frac{0.09}{2.087}$$

$\dfrac{c}{c_c} = 0.0431$ ◀

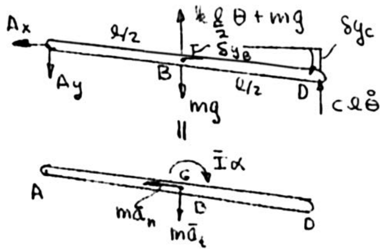
PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



PROBLEM 19.138

A uniform rod of mass m is supported by a pin at A and a spring of constant k at B and is connected at D to a dashpot of damping coefficient c. Determine in terms of m, k, and c, for small oscillations, (*a*) the differential equation of motion, (*b*) the critical damping coefficient c_c.

SOLUTION



In equilibrium, the force in the spring is mg.

For small angles, $\sin\theta \approx \theta \qquad \cos\theta \approx 1$

$$\delta y_B = \frac{l}{2}\theta$$

$$\delta y_C = l\theta$$

(*a*) Newton's Law: $\Sigma M_A = (\Sigma M_A)_{\text{eff}}$

$$\frac{mgl}{2} - \left(k\frac{l}{2}\theta + mg\right)\frac{l}{2} - cl\dot{\theta}l = \bar{I}\alpha + m\bar{a}_t\frac{l}{2}$$

Kinematics: $\alpha = \ddot{\theta}$

$$\bar{a}_t = \frac{l}{2}\alpha = \frac{l}{2}\ddot{\theta}$$

$$\left[\bar{I} + m\left(\frac{l}{2}\right)^2\right]\ddot{\theta} + cl^2\dot{\theta} + k\left(\frac{l}{2}\right)^2\theta = 0$$

$$\bar{I} + m\left(\frac{l}{2}\right)^2 = \frac{1}{3}ml^2$$

$$\ddot{\theta} + \left(\frac{3c}{m}\right)\dot{\theta} + \left(\frac{3k}{4m}\right)\theta = 0 \blacktriangleleft$$

(*b*) Substituting $\theta = e^{\lambda t}$ into the differential equation obtained in (*a*), we obtain the characteristic equation,

$$\lambda^2 + \left(\frac{3c}{m}\right)\lambda + \frac{3k}{4m} = 0$$

and obtain the roots
$$\lambda = \frac{\frac{-3c}{m} \mp \sqrt{\left(\frac{3c}{m}\right)^2 - \left(\frac{3k}{m}\right)}}{2}$$

The critical damping coefficient, c_c, is the value of c, for which the radicand is zero.

Thus, $\left(\frac{3c_c}{m}\right)^2 = \frac{3k}{m}$

$$c_c = \sqrt{\frac{km}{3}} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 19.139

A machine element weighing 800 lb is supported by two springs, each having a constant of 200 lb/in. A periodic force of maximum value 30 lb is applied to the element with a frequency of 2.5 cycles per second. Knowing that the coefficient of damping is $8 \text{ lb}\cdot\text{s/in.}$, determine the amplitude of the steady-state vibration of the element.

SOLUTION

Equivalent spring: $k = 2(200) = 400 \text{ lb/in.} = 4800 \text{ lb/ft}$

Undamped natural frequency: $\omega_n = \sqrt{\dfrac{k}{m}} = \sqrt{\dfrac{4800}{800/32.2}} = 13.90 \text{ rad/s}$

$$f_n = \frac{\omega_n}{2\pi} = \frac{13.90}{2\pi} = 2.212 \text{ Hz}$$

Critical damping coefficient: $c_c = 2\, m\omega_n = 2\left(\dfrac{800}{32.2}\right)(13.90) = 691 \text{ lb}\cdot\text{s/ft}$

Damping coefficient: $c = 8 \text{ lb}\cdot\text{s/in.} = 96 \text{ lb}\cdot\text{s/ft}$

Damping ratio: $\dfrac{c}{c_c} = \dfrac{96}{691} = 0.1390$

Amplitude:

$$x_m = \frac{P_m/k}{\sqrt{\left[1-\left(\frac{\omega_f}{\omega_n}\right)^2\right]^2 + \left[2\frac{c}{c_c}\frac{\omega_f}{\omega_n}\right]^2}} \qquad (1)$$

where

$$\frac{\omega_f}{\omega_n} = \frac{f_f}{f_n} = \frac{2.5 \text{ Hz}}{2.212 \text{ Hz}} = 1.130$$

Substituting into Eq. (1) with $P_m = 30$ lb, we have

$$x_m = \frac{30 \text{ lb}/400 \text{ lb/in.}}{\sqrt{[1-(1.130)^2]^2 + [2(0.1390)(1.130)]^2}} \qquad x_m = 0.1791 \text{ in.} \blacktriangleleft$$

PROBLEM 19.140

In Problem 19.139, determine the required value of the coefficient of damping if the amplitude of the steady-state vibration of the element is to be 0.15 in.

PROBLEM 19.139 A machine element weighing 800 lb is supported by two springs, each having a constant of 200 lb/in. A periodic force of maximum value 30 lb is applied to the element with a frequency of 2.5 cycles per second. Knowing that the coefficient of damping is $8 \text{ lb}\cdot\text{s/in.}$, determine the amplitude of the steady-state vibration of the element.

SOLUTION

Equivalent spring: $k = 2(200) = 400 \text{ lb/in.} = 4800 \text{ lb/ft}$

Undamped natural frequency: $\omega_n = \sqrt{\dfrac{k}{m}} = \sqrt{\dfrac{4800}{800/32.2}} = 13.90 \text{ rad/s}$

$$f_n = \frac{\omega_n}{2\pi} = \frac{13.90}{2\pi} = 2.212 \text{ Hz}$$

Critical damping coefficient: $c_c = 2\,m\omega_n = 2\left(\dfrac{800}{32.2}\right)(13.90) = 691 \text{ lb}\cdot\text{s/ft}$

Amplitude:

$$x_m = \frac{P_m/k}{\sqrt{\left[1-\left(\frac{\omega_f}{\omega_n}\right)^2\right]^2 + \left[2\frac{c}{c_c}\frac{\omega_f}{\omega_n}\right]^2}} \qquad (1)$$

where $\dfrac{\omega_f}{\omega_n} = \dfrac{f_f}{f_n} = \dfrac{2.5 \text{ Hz}}{2.212 \text{ Hz}} = 1.130$

Using $x_m = 0.15$ in., $P_m = 30$ lb, and $k = 400$ lb/in.

$$0.15 \text{ in.} = \frac{30 \text{ lb}/400 \text{ lb/in.}}{\sqrt{[1-(1.130)^2]^2 + \left[2\,\frac{c}{c_c}(1.130)\right]^2}}$$

Solving for $\frac{c}{c_c}$, we find $\frac{c}{c_c} = 0.1842$.

Since $c_c = 691 \text{ lb}\cdot\text{s/ft}$, we have

$c = (0.1842)(691)$ $\qquad c = 1273 \text{ lb}\cdot\text{s/ft}$

or $\qquad c = 10.61 \text{ lb}\cdot\text{s/in.}$ ◀

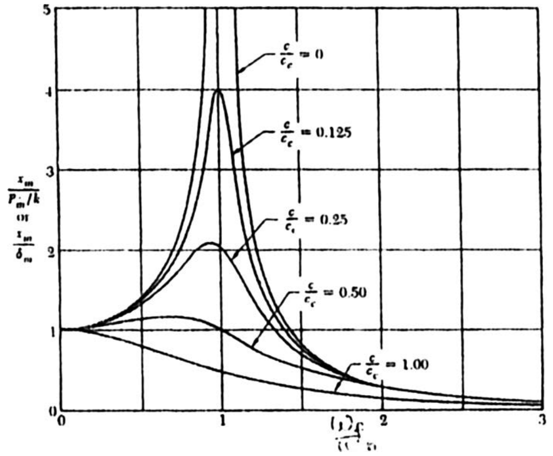
PROBLEM 19.141

In the case of the forced vibration of a system, determine the range of values of the damping factor c/c_c for which the magnification factor will always decrease as the frequency ratio ω_f/ω_n increases.

SOLUTION



From Eq. (19.53)$'$:

Magnification factor:

$$\frac{x_m}{\frac{P_m}{k}} = \frac{1}{\sqrt{\left[1-\left(\frac{\omega_f}{\omega_n}\right)^2\right]^2 + \left[2\left(\frac{c}{c_c}\right)\left(\frac{\omega_f}{\omega_n}\right)\right]^2}}$$

Find value of $\frac{c}{c_c}$ for which there is no maximum for $\frac{x_m}{\frac{P_m}{k}}$ as $\frac{\omega_f}{\omega_n}$ increases.

$$\frac{d\left(\frac{x_m}{\frac{P_m}{k}}\right)^2}{d\left(\frac{\omega_f}{\omega_n}\right)^2} = \frac{-\left[2\left(1-\left(\frac{\omega_f}{\omega_n}\right)^2\right)(-1)+4\frac{c^2}{c_c^2}\right]}{\left\{\left[1-\left(\frac{\omega_f}{\omega_n}\right)^2\right]^2 + \left[2\left(\frac{c}{c_c}\right)\left(\frac{\omega_f}{\omega_n}\right)^2\right]\right\}^2} = 0$$

$$-2+2\left(\frac{\omega_f}{\omega_n}\right)^2 + 4\frac{c^2}{c_c^2} = 0$$

$$\left(\frac{\omega_f}{\omega_n}\right)^2 = 1 - 2\frac{c^2}{c_c^2}$$

For $\frac{c^2}{c_c^2} \ge \frac{1}{2}$, there is no maximum for $\frac{x_m}{\left(\frac{P_m}{k}\right)}$ and the magnification factor will decrease as $\frac{\omega_f}{\omega_n}$ increases.

$$\frac{c}{c_c} \ge \frac{1}{\sqrt{2}} \qquad \frac{c}{c_c} \ge 0.707 \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. If you are a student using this Manual, you are using it without permission.*

PROBLEM 19.142

Show that for a small value of the damping factor c/c_c, the maximum amplitude of a forced vibration occurs when $\omega_f \approx \omega_n$ and that the corresponding value of the magnification factor is $\frac{1}{2}(c/c_c)$.

SOLUTION

From Eq. (19.53′):

$$\text{Magnification factor} = \frac{x_m}{\frac{P_m}{k}} = \frac{1}{\sqrt{\left[1-\left(\frac{\omega_f}{\omega_n}\right)^2\right]^2 + \left[2\left(\frac{c}{c_c}\right)\left(\frac{\omega_f}{\omega_n}\right)\right]^2}}$$

Find value of $\dfrac{\omega_f}{\omega_n}$ for which $\dfrac{x_m}{\frac{P_m}{k}}$ is a maximum.

$$0 = \frac{d\left(\frac{x_m}{\frac{P_m}{k}}\right)^2}{d\left(\frac{\omega_f}{\omega_n}\right)^2} = -\frac{\left[2\left[1-\left(\frac{\omega_f}{\omega_n}\right)^2\right](-1) + 4\left(\frac{c^2}{c_c^2}\right)\right]}{\left\{\left[1-\left(\frac{\omega_f}{\omega_n}\right)^2\right]^2 + \left[2\left(\frac{c}{c_c}\right)\left(\frac{\omega_f}{\omega_n}\right)\right]^2\right\}^2}$$

$$-2 + 2\left(\frac{\omega_f}{\omega_n}\right)^2 + 4\left(\frac{c}{c_c}\right)^2 = 0$$

For small $\dfrac{c}{c_c}$, $\qquad \dfrac{\omega_f}{\omega_n} \approx 1 \qquad \omega_f \approx \omega_n$

For $\qquad \dfrac{\omega_f}{\omega_n} = 1$

$$\frac{x_m}{\frac{P_m}{k}} = \frac{1}{\sqrt{[1-1]^2 + \left[2\left(\frac{c}{c_c}\right)1\right]^2}} \qquad \frac{x_m}{\left(\frac{P_m}{k}\right)} = \frac{1}{2}\frac{c_c}{c} \blacktriangleleft$$

PROBLEM 19.143

A counter-rotating eccentric mass exciter consisting of two rotating 14-oz masses describing circles of 6-in. radius at the same speed but in opposite senses is placed on a machine element to induce a steady-state vibration of the element and to determine some of the dynamic characteristics of the element. At a speed of 1200 rpm a stroboscope shows the eccentric masses to be exactly under their respective axes of rotation and the element to be passing through its position of static equilibrium. Knowing that the amplitude of the motion of the element at that speed is 0.6 in. and that the total mass of the system is 300 lb, determine (*a*) the combined spring constant *k*, (*b*) the damping factor c/c_c.

SOLUTION

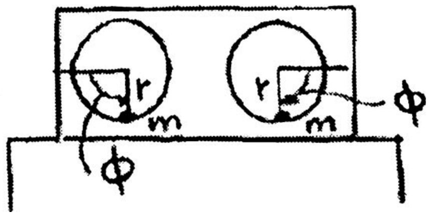
Forcing frequency: $\omega_f = 1200 \text{ rpm} = 125.664 \text{ rad/s}$

Unbalance of one mass: $w = 14 \text{ oz} = 0.875 \text{ lb}$

$r = 6 \text{ in.} = 0.5 \text{ ft}$

Shaking force:

$$P = 2\, mr\omega_f^2 \sin \omega_f t$$
$$= (2)\left(\tfrac{0.875}{32.2}\right)(0.5)(125.664)^2 \sin \omega_f t$$
$$= 429.11 \sin \omega_f t$$
$$P_m = 429 \text{ lb}$$



Total weight: $W = 300 \text{ lb}$

By Eqs. (19.48) and (19.52), the vibratory response of the system is

$$x = x_m \sin(\omega_f t - \varphi)$$

where

$$x_m = \frac{P_m}{\sqrt{\left(k - M\omega_f^2\right)^2 + (c\omega_f)^2}} \tag{1}$$

and

$$\tan\varphi = \frac{c\omega_f}{k - M\omega_f^2} \tag{2}$$

Since $\varphi = 90° = \dfrac{\pi}{2}$, $\tan\varphi = \infty$ and $k - M\omega_f^2 = 0.$

(*a*) Combined spring constant.

$$k = M\omega_f^2$$
$$= \left(\tfrac{300}{32.2}\right)(125.664)^2$$
$$= 147.12 \times 10^3 \text{ lb/ft}$$

$k = 147 \text{ kip/ft}$ ◀

All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 19.143 (Continued)

The observed amplitude is $x_m = 0.6 \text{ in.} = 0.05 \text{ ft}$

From Eq. (1):

$$c = \frac{1}{\omega_f}\sqrt{\left(\frac{P_m}{x_m}\right)^2 - (k - M\omega_f)^2} = \frac{P_m}{\omega_f x_m}$$

$$= \frac{429.11}{(125.664)(0.05)}$$

$$= 68.296 \text{ lb}\cdot\text{s/ft}$$

Critical damping coefficient:

$$c_c = 2\sqrt{kM}$$

$$= 2\sqrt{(147.12\times10^3)\left(\tfrac{300}{32.2}\right)}$$

$$= 2.3416\times10^3 \text{ lb}\cdot\text{s/ft}$$

(*b*) Damping factor.

$$\frac{c}{c_c} = \frac{68.296}{2.3416\times10^3}$$

$$\frac{c}{c_c} = 0.0292 \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 19.144

A 15-kg motor is supported by four springs, each of constant 40 kN/m. The unbalance of the motor is equivalent to a mass of 20 kg located 125 mm from the axis of rotation. Knowing that the motor is constrained to move vertically and that the damping factor c/c_c is equal to 0.4, determine the range of frequencies for which the amplitude of the steady-state vibration of the motor is less than 0.2 mm.

SOLUTION

Equivalent spring: $k = (4)(40\times 10^3 \text{ N/m}) = 160\times 10^3 \text{ N/m}$

Mass: $m = 15 \text{ kg}$

Natural frequency: $\omega_n = \sqrt{\dfrac{k}{m}} = \sqrt{\dfrac{160\times 10^3}{15}} = 103.280 \text{ rad/s}$

Unbalanced force:

$$P_m = m_{\text{eq}} r\omega_f^2 = m_{\text{eq}} r\omega_n^2 \left(\frac{\omega_f}{\omega_n}\right)^2$$

$$= (0.020 \text{ kg})(0.125 \text{ m})(130.280 \text{ rad/s})^2$$

$$= 26.667\left(\frac{\omega_f}{\omega_n}\right)^2 \text{ N}$$

At steady state,

$$x_m = \frac{P_m/k}{\left[\left(1-\left(\frac{\omega_f}{\omega_n}\right)^2\right)^2 + \left(2\frac{c}{c_c}\frac{\omega_f}{\omega_n}\right)^2\right]^{1/2}}$$

$$\left[\left(1-\left(\frac{\omega_f}{\omega_n}\right)^2\right)^2 + \left(2\frac{c}{c_c}\frac{\omega_f}{\omega_n}\right)^2\right]^{1/2} = \frac{P_m}{kx_m}$$

$$1-2\left(\frac{\omega_f}{\omega}\right)^2 + \left(\frac{\omega_f}{\omega_n}\right)^4 + \left(2\,\frac{c}{c_c}\frac{\omega_f}{\omega_n}\right)^2 = \left(\frac{P_m}{kx_m}\right)^2 \qquad (1)$$

Amplitude: $x_m = 0.2 \text{ mm} = 0.2\times 10^{-3} \text{ m}$

$$\frac{P_m}{kx_m} = \frac{26.667}{(160\times 10^3)(0.2\times 10^{-3})}\left(\frac{\omega_f}{\omega_n}\right)^2 = 0.83333\left(\frac{\omega_f}{\omega_n}\right)^2$$

Damping factor: $\dfrac{c}{c_c} = 0.4$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

Substituting into Eq. (1),
$$1-2\left(\frac{\omega_f}{\omega_n}\right)^2+\left(\frac{\omega_f}{\omega_n}\right)^4+\left[(2)(0.4)\frac{\omega_f}{\omega_n}\right]^2=\left(0.83333\frac{\omega_f^2}{\omega_n^2}\right)^2$$

$$[(1-(0.83333)^2]\left(\frac{\omega_f}{\omega_n}\right)^4-[2-(2)^2(0.4)^2]\left(\frac{\omega_f}{\omega_n}\right)^2+1=0$$

$$0.30556\left(\frac{\omega_f}{\omega_n}\right)^4-1.36\left(\frac{\omega_f}{\omega_n}\right)^2+1=0$$

Solving the quadratic equation for $\left(\frac{\omega_f}{\omega_n}\right)^2$,

$$\left(\frac{\omega_f}{\omega_n}\right)^2=3.5216 \quad \text{and} \quad 0.92934$$

$$\frac{\omega_f}{\omega_n}=1.8766 \quad \text{and} \quad 0.96402$$

$$\omega_f=(1.8766)(103.280\text{ rad/s})=193.815\text{ rad/s}$$

and
$$\omega_f=(0.96402)(103.280\text{ rad/s})=99.564\text{ rad/s}$$

For $x_m<0.2$ m, the forcing frequency must satisfy

$$\omega_f>193.8\text{ rad/s} \quad \text{and} \quad \omega_f<99.6\text{ rad/s}$$

Since
$$f_f=\frac{\omega_f}{2\pi},$$

$f_f>30.8$ Hz and $f_f<15.85$ Hz ◀

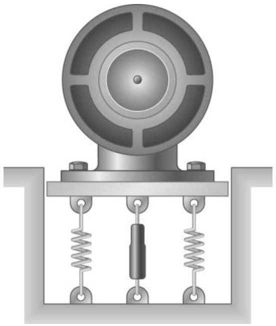
PROBLEM 19.145



A 220-lb motor is supported by four springs, each of constant 500 lb/in., and is connected to the ground by a dashpot having a coefficient of damping $c = 35$ lb · s/in. The motor is constrained to move vertically, and the amplitude of its motion is observed to be 0.08 in. at a speed of 1200 rpm. Knowing that the weight of the rotor is 30 lb, determine the distance between the mass center of the rotor and the axis of the shaft.

SOLUTION

Forcing frequency: $\omega_f = 1200 \text{ rpm} = 125.664 \text{ rad/s}$

Equivalent spring: $k = (4)(500) = 2000 \text{ lb/in.} = 24000 \text{ lb/ft}$

Mass: $$m = \frac{W}{g} = \frac{220 \text{ lb}}{32.2 \text{ ft/s}^2} = 6.8323 \text{ lb} \cdot \text{s}^2/\text{ft}$$

Natural frequency: $$\omega_n = \sqrt{\frac{k}{m}} = \sqrt{\frac{24000}{6.8323}} = 59.268 \text{ rad/s}$$

$$\frac{\omega_f}{\omega_n} = \frac{125.664 \text{ rad/s}}{59.268 \text{ rad/s}} = 2.12026$$

Critical damping coefficient: $c_c = 2m\omega_n$

$$c_c = (2)(6.8323)(59.268) = 809.87 \text{ lb} \cdot \text{s/ft}$$

Damping coefficient: $c = 35 \text{ lb} \cdot \text{s/in.} = 420 \text{ lb} \cdot \text{s/ft}$

Damping factor: $$\frac{c}{c_c} = \frac{420}{809.87} = 0.51860$$

Amplitude: $x_m = 0.08 \text{ in.} = 6.6667 \times 10^{-3} \text{ ft}$

$$x_m = \frac{P_m/k}{\left[\left(1 - \left(\frac{\omega_f}{\omega_n}\right)^2\right)^2 + \left(2\frac{c}{c_c}\frac{\omega_f}{\omega_n}\right)^2\right]^{1/2}}$$

Unbalanced force: $$P_m = kx_m\left[\left(1 - \left(\frac{\omega_f}{\omega_n}\right)^2\right)^2 + \left(2\frac{c}{c_c}\frac{\omega_f}{\omega_n}\right)^2\right]^{1/2}$$

$$= kx_m[(1 - 4.4955)^2 + ((2)(0.51860)(2.12026))^2]^{1/2}$$

$$= kx_m\ [12.2185 + 4.8362]^{1/2}$$

$$= 4.1297\, kx_m = (4.1297)(24000)(6.6667 \times 10^{-3})$$

$$= 660.76 \text{ lb}$$

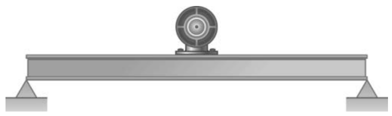
PROBLEM 19.146



A 100-lb motor is directly supported by a light horizontal beam which has a static deflection of 0.2 in. due to the weight of the motor. The unbalance of the rotor is equivalent to a mass of 3.5 oz located 3 in. from the axis of rotation. Knowing that the amplitude of the vibration of the motor is 0.03 in. at a speed of 400 rpm, determine (*a*) the damping factor c/c_c, (*b*) the coefficient of damping *c*.

SOLUTION

Spring constant: $$k = \frac{W}{\delta_{\text{st}}} = \frac{100}{\frac{0.2}{12}} = 6000 \text{ lb/ft}$$

Natural undamped circular frequency: $$\omega_n = \sqrt{\frac{k}{m}} = \sqrt{\frac{6000}{\frac{100}{32.2}}} = 43.955 \text{ rad/s}$$

Unbalance: $$m' = \frac{w}{g} = \frac{\frac{3.5}{16}}{32.2} 6.7935 \times 10^{-3} \text{ slug}$$

$$r = 3 \text{ in.} = 0.25 \text{ ft}$$

Forcing frequency: $$\omega_f = 400 \text{ rpm} = 41.888 \text{ rad/s}$$

Unbalance force: $$P_m = m' r \omega_f^2 = (6.7935 \times 10^{-3})(0.25)(41.888)^2 = 2.98 \text{ lb}$$

Static deflection: $$\delta_{\text{st}} = \frac{P_m}{k} = \frac{2.98}{6000} = 0.49666 \times 10^{-3} \text{ ft}$$

Amplitude: $$x_m = 0.03 \text{ in.} = 2.5 \times 10^{-3} \text{ ft}$$

Frequency ratio: $$\frac{\omega_f}{\omega_n} = \frac{41.888}{43.955} = 0.95298$$

Eq. (19.53): $$x_m = \frac{\delta_{\text{st}}}{\sqrt{\left[1 - \left(\frac{\omega_f}{\omega_n}\right)^2\right]^2 + \left[2\left(\frac{c}{c_c}\right)\left(\frac{\omega_f}{\omega_n}\right)\right]^2}}$$

$$\left[1 - \left(\frac{\omega_f}{\omega_n}\right)^2\right]^2 + \left[2\left(\frac{c}{c_c}\right)\left(\frac{\omega_f}{\omega_n}\right)\right]^2 = \left(\frac{\delta_{\text{st}}}{x_m}\right)^2$$

$$[1 - (0.95298)^2]^2 + \left[2\left(\frac{c}{c_c}\right)(0.95298)\right]^2 = \left[\frac{0.49666 \times 10^{-3}}{2.5 \times 10^{-3}}\right]^2$$

$$0.0084326 + 3.6327\left(\frac{c}{c_c}\right)^2 = 0.039467$$

$$\left(\frac{c}{c_c}\right)^2 = 0.0085431$$

If you are a student using this Manual, you are using it without permission.*

PROBLEM 19.147

A machine element is supported by springs and is connected to a dashpot as shown. Show that if a periodic force of magnitude $P = P_m \sin \omega_f t$ is applied to the element, the amplitude of the fluctuating force transmitted to the foundation is

$$F_m = P_m \sqrt{\frac{1+\left[2\left(\frac{c}{c_c}\right)\left(\frac{\omega_f}{\omega_n}\right)\right]^2}{\left[1-\left(\frac{\omega_f}{\omega_n}\right)^2\right]^2+\left[2\left(\frac{c}{c_c}\right)\left(\frac{\omega_f}{\omega_n}\right)^2\right]^2}}$$

SOLUTION

From Equation (19.48), the motion of the machine is $\quad x = x_m \sin(\omega_f t - \phi)$

The force transmitted to the foundation is

Springs: $\quad F_s = kx = kx_m \sin(\omega_f t - \phi)$

Dashpot: $\quad F_d = c\dot{x} = cx_m\omega_f \cos(\omega_f t - \phi)$

$$F_t = x_m[k \sin(\omega_f t - \phi) + c\omega_f \cos(\omega_f t - \phi)]$$

or recalling the identity,

$$A \sin y + B \cos y = \sqrt{A^2 + B^2} \sin(y + \psi)$$

$$\sin \psi = \frac{B}{\sqrt{A^2 + B^2}}$$

$$\cos \psi = \frac{A}{\sqrt{A^2 + B^2}}$$

$$F_t = \left[x_m \sqrt{k^2 + (c\omega_f)^2}\right] \sin(\omega_f t - \phi + \psi)$$

Thus, the amplitude of F_t is $\quad F_m = x_m \sqrt{k^2 + (c\omega_f)^2} \quad (1)$

From Equation (19.53):

$$x_m = \frac{\frac{P_m}{k}}{\sqrt{\left[1-\left(\frac{\omega_f}{\omega_n}\right)^2\right]^2+\left[2\left(\frac{c}{c_c}\right)\frac{\omega_f}{\omega_n}\right]^2}}$$

Substituting for x_m in Equation (1),

$$F_m = \frac{P_m\sqrt{1+\left(\frac{c\omega_f}{k}\right)^2}}{\sqrt{\left[1-\left(\frac{\omega_f}{\omega_n}\right)^2\right]^2+\left[2\left(\frac{c}{c_c}\right)\left(\frac{\omega_f}{\omega_n^2}\right)\right]}} \quad (2)$$

$$\omega_n^2 = \frac{k}{m}$$

PROBLEM 19.148

A 91-kg machine element supported by four springs, each of constant $k = 175$ N/m, is subjected to a periodic force of frequency 0.8 Hz and amplitude 89 N. Determine the amplitude of the fluctuating force transmitted to the foundation if (*a*) a dashpot with a coefficient of damping $c = 365$ N · s/m is connected to the machine element and to the ground, (*b*) the dashpot is removed.

SOLUTION

Forcing frequency: $\omega_f = 2\pi f_f = (2\pi)(0.8) = 1.6\pi$ rad/s

Exciting force amplitude: $P_m = 89$ N

Equivalent spring constant: $k = (4)(175 \text{ N/m}) = 700$ N/m

Natural frequency:

$$\omega_n = \sqrt{\frac{k}{m}} = \sqrt{\frac{700}{91}}$$
$$= 2.7735 \text{ rad/s}$$

Frequency ratio:

$$\frac{\omega_f}{\omega_n} = \frac{1.6\pi}{2.7735}$$
$$= 1.8123$$

Critical damping coefficient:

$$c_c = 2\sqrt{km}$$
$$= 2\sqrt{(700)(91)}$$
$$= 504.78 \text{ N} \cdot \text{s/m}$$

From the derivation given in Problem 19.147, the amplitude of the force transmitted to the foundation is

$$F_m = \frac{P_m\sqrt{1 + \left[2\left(\frac{c}{c_c}\right)\left(\frac{\omega_f}{\omega_n}\right)\right]^2}}{\sqrt{\left[1 - \left(\frac{\omega_f}{\omega_n}\right)^2\right]^2 + \left[2\left(\frac{c}{c_c}\right)\left(\frac{\omega_f}{\omega_n}\right)\right]^2}} \qquad (1)$$

$$1 - \left(\frac{\omega_f}{\omega_n}\right)^2 = 1 - (1.8123)^2 = -2.2844$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. If you are a student using this Manual, you are using it without permission.*

PROBLEM 19.148 (Continued)

(*a*) F_m when $c = 365\ \text{N}\cdot\text{s/m}$:

$$\frac{c}{c_c} = \frac{365}{504.78} = 0.72309$$

$$2\left(\frac{c}{c_c}\right)\left(\frac{\omega_f}{\omega_n}\right) = (2)(0.72309)(1.8123) = 2.6209$$

From Eq. (1):

$$F_m = \frac{89\sqrt{1+(2.6209)^2}}{\sqrt{(-2.2844)^2+(2.6209)^2}} = \frac{89\sqrt{7.8692}}{\sqrt{12.088}}$$

$F_m = 71.8\ \text{N}$ ◀

(*b*) F_m when $c = 0$:

$$F_m = \frac{P_m}{\left|1-\left(\frac{\omega_f}{\omega_n}\right)^2\right|} = \frac{89}{2.2844}$$

$F_m = 39.0\ \text{N}$ ◀

PROBLEM 19.149

A simplified model of a washing machine is shown. A bundle of wet clothes forms a weight w_b of 20 lb in the machine and causes a rotating unbalance. The rotating mass is 40 lb (including m_b) and the radius of the washer basket e is 9 in. Knowing the washer has an equivalent spring constant k = 70 lb/ft and damping ratio $\zeta = c/c_c = 0.05$ and during the spin cycle the drum rotates at 250 rpm, determine the amplitude of the motion and the magnitude of the force transmitted to the sides of the washing machine.

SOLUTION

Forced circular frequency: $\omega_f = \dfrac{(2\pi)(250)}{60} = 26.18 \text{ rad/s}$

System mass: $m = \dfrac{W}{g} = \dfrac{40 \text{ lb}}{32.2}$

Spring constant: $k = 70 \text{ lb/ft}$

Natural circular frequency: $\omega_n = \sqrt{\dfrac{k}{m}} = \sqrt{\dfrac{70}{\frac{40}{32.2}}} = 7.5067 \text{ rad/s}$

Critical damping constant: $c_c = 2\sqrt{km} = 2\sqrt{(70)\left(\frac{40}{32.2}\right)} = 18.650 \text{ lb}\cdot\text{s/ft}$

Damping constant: $c = \left(\dfrac{c}{c_c}\right)c_c = (0.05)(18.650) = 0.9325 \text{ lb}\cdot\text{s/ft}$

Unbalance force: $m_b = \dfrac{w_b}{g}$

$$P_m = m_b e \omega_f^2$$

$$P_m = \left(\frac{20 \text{ lb}}{32.2}\right)\left(\frac{9}{12}\text{ft}\right)(26.18 \text{ rad/s})^2 = 319.28 \text{ lb}$$

The differential equation of motion is

$$m\ddot{x} + c\dot{x} + kx = P_m \sin \omega_f t$$

The steady state response is

$$x = x_m \sin(\omega_f t - \varphi) \qquad \dot{x} = \omega_f x_m \cos(\omega_f t - \varphi)$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. where
$$x_m = \frac{P_m}{\sqrt{\left(k - m\omega_f^2\right)^2 + (c\omega_f)^2}}$$
$$= \frac{319.28}{\sqrt{[70 - \left(\frac{40}{32.2}\right)(26.18)^2]^2 + [(0.9325)(26.18)]^2}}$$
$$= \frac{319.28}{\sqrt{(-781.42)^2 + (24.413)^2}} = \frac{319.28}{781.796} = 0.40839 \text{ ft}$$

(*a*) Amplitude of vibration. $x_m = 4.90$ in. ◀

$$x = 0.40839\sin(\omega_f t - \varphi)$$
$$\dot{x} = (26.18)(0.40839)\cos(\omega_f t - \varphi)$$
$$= 10.6917\cos(\omega_f t - \varphi)$$

Spring force:
$$kx = (70)(0.40839)\sin(\omega_f t - \varphi)$$
$$= 28.588\sin(\omega_f t - \varphi)$$

Damping force:
$$c\dot{x} = (0.9325)(10.6917)\cos(\omega_f t - \varphi)$$
$$= 9.9701\cos(\omega_f t - \varphi)$$

(*b*) Total force:
$$F = 28.588\sin(\omega_f t - \varphi) + 9.9701\cos(\omega_f t - \varphi)$$

Let
$$F = F_m \cos\psi \sin(\omega_f t - \varphi) + F_m \sin\psi \sin(\omega_f t - \varphi)$$
$$= F_m \sin(\omega_f t - \varphi + \psi)$$

Maximum force.
$$F_m^2 = F_m^2 \cos^2\psi + F_m^2 \sin^2\psi$$
$$= (28.588)^2 + (9.9701)^2$$
$$= 916.65$$

$F_m = 30.3$ lb ◀

PROBLEM 19.150*

For a steady-state vibration with damping under a harmonic force, show that the mechanical energy dissipated per cycle by the dashpot is $E = \pi c x_m^2 \omega_f$, where c is the coefficient of damping, x_m is the amplitude of the motion, and ω_f is the circular frequency of the harmonic force.

SOLUTION

Energy is dissipated by the dashpot.

From Equation (19.48), the deflection of the system is

$$x = x_m \sin(\omega_f t - \varphi)$$

The force on the dashpot.

$$F_d = c\dot{x}$$

$$F_d = c x_m \omega_f \cos(\omega_f t - \varphi)$$

The work done in a complete cycle with

$$\tau_f = \frac{2\pi}{\omega_f}$$

$$E = \int F_d dx \text{ (i.e., force} \times \text{distance)}$$

$$dx = x_m \omega_f \cos(\omega_f t - \varphi) dt$$

$$E = \int_0^{2\pi/\omega_f} c x_m^2 \omega_f^2 \cos^2(\omega_f t - \varphi) dt$$

$$\cos^2(\omega_D t - \varphi) = \frac{[1 - 2\cos(\omega_f t - \phi)]}{2}$$

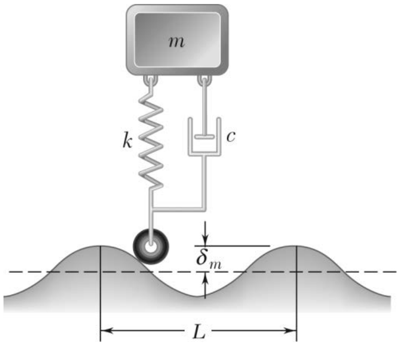
$$E = c x_m^2 \omega_f^2 \int_0^{2\pi/\omega_f} \frac{1 - 2\cos(\omega_f t - \phi)}{2} dt$$

$$E = \frac{c x_m^2 \omega_f^2}{2} \left[t - \frac{2\sin(\omega_f t - \phi)}{\omega_f} \right]_0^{2\pi/\omega_f}$$

$$E = \frac{c x_m^2 \omega_f^2}{2} \left[\frac{2\pi}{\omega_f} - \frac{2}{\omega_f} (\sin(2\pi - \varphi) + \sin\varphi) \right]$$

$E = \pi c x_m^2 \omega_f$ Q.E.D. ◀

All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

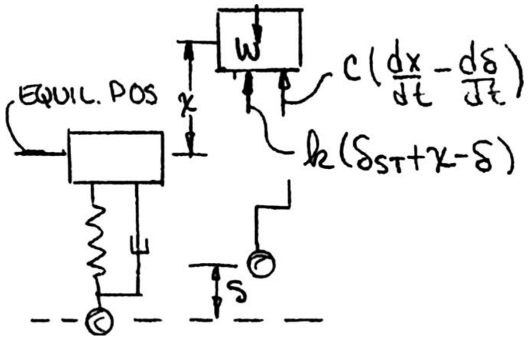


PROBLEM 19.151*

The suspension of an automobile can be approximated by the simplified spring-and-dashpot system shown. (*a*) Write the differential equation defining the vertical displacement of the mass *m* when the system moves at a speed *v* over a road with a sinusoidal cross section of amplitude δ_m and wave length *L*. (*b*) Derive an expression for the amplitude of the vertical displacement of the mass *m*.

SOLUTION

(*a*)



$$+\downarrow \Sigma F = ma: \quad W - k(\delta_{\text{st}} + x - \delta) - c\left(\frac{dx}{dt} - \frac{d\delta}{dt}\right) = m\frac{d^2x}{dt^2}$$

Recalling that $W = k\delta_{\text{st}}$, we write

$$m\frac{d^2x}{dt^2} + c\frac{dx}{dt} + kx = k\delta + c\frac{d\delta}{dt} \tag{1}$$

Motion of wheel is a sine curve, $\delta = \delta_m \sin\omega_f t.$ The interval of time needed to travel a distance *L* at a speed *v* is $t = \dfrac{L}{v}.$

Thus,
$$\omega_f = \frac{2\pi}{\tau_f} = \frac{2\pi}{\frac{L}{v}} = \frac{2\pi v}{L}$$

and
$$\delta = \delta_m \sin\omega_f t \qquad \frac{d\delta}{dt} = \frac{\delta_m 2\pi}{\frac{L}{v}}\cos\omega_f t$$

Thus, Equation (1) is

$$m\frac{d^2x}{dt} + c\frac{dx}{dt} + kx = (k\sin\omega_f t + c\omega_f \cos\omega_f t)\delta_m \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

(*b*) From the identity $$A\sin y + B\cos y = \sqrt{A^2+B^2}\,\sin(y+\psi)$$

$$\sin\psi = \frac{B}{\sqrt{A^2+B^2}}$$

$$\cos\psi = \frac{A}{\sqrt{A^2+B^2}}$$

We can write the differential equation

$$m\frac{d^2x}{dt^2} + c\frac{dx}{dt} + kx = \delta_m\sqrt{k^2+(c\omega_f)^2}\,\sin(\omega_f t+\psi)$$

$$\psi = \tan^{-1}\frac{c\omega_f}{k}$$

The solution to this equation is analogous to Equations 19.47 and 19.48, with

$$P_m = \delta_m\sqrt{k^2+(c\omega_f)^2}$$

$$x = x_m\sin(\omega_f t - \varphi + \psi) \text{ (where analogous to Equations (19.52))} \blacktriangleleft$$

$$x_m = \frac{\delta_m\sqrt{k^2+(c\omega_f)^2}}{\sqrt{\left(k-m\omega_f^2\right)^2+(c\omega_f)^2}} \blacktriangleleft$$

$$\tan\varphi = \frac{c\omega_f}{k-m\omega_f^2} \blacktriangleleft$$

$$\tan\psi = \frac{c\omega_f}{k} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 19.152*

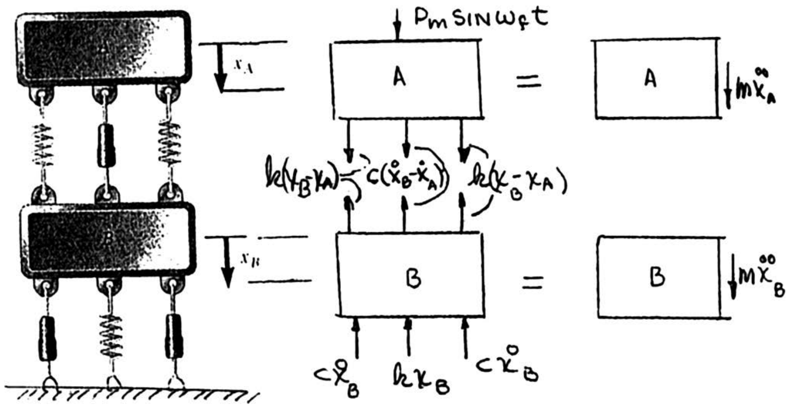
Two blocks A and B, each of mass m, are supported as shown by three springs of the same constant k. Blocks A and B are connected by a dashpot, and block B is connected to the ground by two dashpots, each dashpot having the same coefficient of damping c. Block A is subjected to a force of magnitude $P = P_m \sin \omega_f t$. Write the differential equations defining the displacements x_A and x_B of the two blocks from their equilibrium positions.

SOLUTION



Since the origins of coordinates are chosen from the equilibrium position, we may omit the initial spring compressions and the effect of gravity

For load A,

$$+\downarrow \Sigma F = ma_A: \quad P_m \sin \omega_f t + 2k(x_B - x_A) + c(\dot{x}_B - \dot{x}_A) = m\ddot{x}_A \qquad (1)$$

For load B,

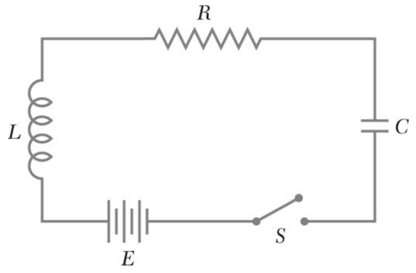
$$+\downarrow \Sigma F = ma_B: \quad -2k(x_B - x_A) - c(\dot{x}_B - \dot{x}_A) - kx_B - 2c\dot{x}_B = m\ddot{x}_B \qquad (2)$$

Rearranging Equations (1) and (2), we find:

$$m\ddot{x}_A + c(\dot{x}_A - \dot{x}_B) + 2k(x_A - x_B) = P_m \sin \omega_f t \blacktriangleleft$$

$$m\ddot{x}_B + 3c\dot{x}_B - c\dot{x}_A + 3kx_B - 2kx_A = 0 \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



PROBLEM 19.153

Express in terms of L, C, and E the range of values of the resistance R for which oscillations will take place in the circuit shown when switch S is closed.

SOLUTION

For a mechanical system, oscillations take place if $c < c_c$ (lightly damped).

But from Equation (19.41),

$$c_c = 2m\sqrt{\frac{k}{m}} = 2\sqrt{km}$$

Therefore,

$$c < 2\sqrt{km} \quad (1)$$

From Table 19.2:

$$c \longrightarrow R$$

$$m \longrightarrow L$$

$$k \longrightarrow \frac{1}{C} \quad (2)$$

Substituting in Eq. (1) the analogous electrical values in Eq. (2), we find that oscillations will take place if

$$R < 2\sqrt{\left(\frac{1}{C}\right)(L)} \qquad R < 2\sqrt{\frac{L}{C}} \blacktriangleleft$$

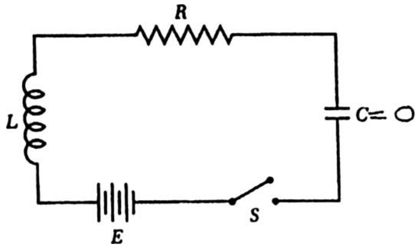
PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 19.154

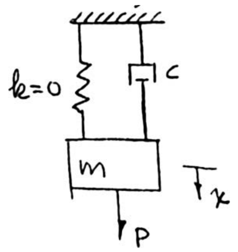
Consider the circuit of Problem 19.153 when the capacitor C is removed. If switch S is closed at time $t = 0$, determine (*a*) the final value of the current in the circuit, (*b*) the time t at which the current will have reached $(1 - 1/e)$ times its final value. (The desired value of t is known as the *time constant* of the circuit.)

SOLUTION

Electrical system

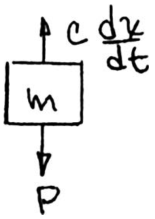


Mechanical system



The mechanical analogue of closing a switch S is the sudden application of a constant force of magnitude P to the mass.

(*a*) Final value of the current corresponds to the final velocity of the mass, and since the capacitance is zero, the spring constant is also zero



$$+\downarrow \Sigma F = ma: \quad P - c\frac{dx}{dt} = m\frac{d^2x}{dt^2} \tag{1}$$

Final velocity occurs when $$\frac{d^2x}{dt^2} = 0$$

$$P - c\left.\frac{dx}{dt}\right|_{\text{final}} = 0 \qquad \left.\frac{dx}{dt}\right|_{\text{final}} = v_{\text{final}}$$

$$v_{\text{final}} = \frac{P}{c}$$

From Table 19.2: $v \longrightarrow i, \quad P \longrightarrow E, \quad c \longrightarrow R$

Thus, $$i_{\text{final}} = \frac{E}{R} \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 19.154 (Continued)

(*b*) Rearranging Equation (1), we have

$$m\frac{d^2x}{dt^2}+c\frac{dx}{dt}=P$$

Substitute
$$\frac{dx}{dt}=Ae^{-\lambda t}+\frac{P}{c}; \qquad \frac{d^2x}{dt}=-A\lambda e^{-\lambda t}$$

$$m\left[-A\lambda e^{-\lambda t}\right]+c\left[Ae^{-\lambda t}+\frac{P}{c}\right]=P$$

$$-m\lambda+c=0 \qquad \lambda=\frac{c}{m}$$

Thus,
$$\frac{dx}{dt}=Ae^{-(c/m)t}+\frac{P}{c}$$

At $t=0$,
$$\frac{dx}{dt}=0 \quad 0=A+\frac{P}{c} \qquad A=-\frac{P}{c}$$

$$v=\frac{dx}{dt}=\frac{p}{c}\left[1-e^{-(c/m)t}\right]$$

From Table 19.2:
$$v \longrightarrow i, \;\; P \longrightarrow E, \;\; c \longrightarrow R, \;\; m \longrightarrow L$$

$$L=\frac{E}{R}\left[1-e^{-(R/L)t}\right]$$

For $i=\left(\frac{E}{R}\right)\left(1-\frac{1}{e}\right)$,
$$\left(\frac{R}{L}\right)t=1$$
$$t=\frac{L}{R} \blacktriangleleft$$

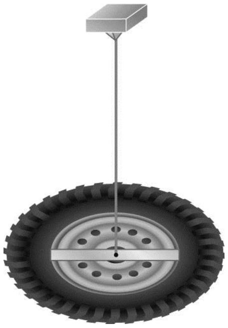
PROBLEM 19.159

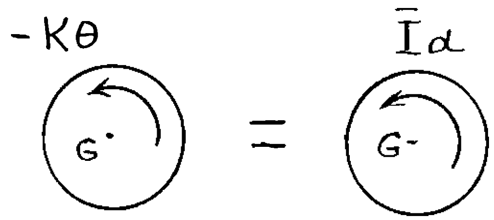


An automobile wheel-and-tire assembly of total weight 47 lb is attached to a mounting plate of negligible weight which is suspended from a steel wire. The torsional spring constant of the wire is known to be $K = 0.40 \text{ lb} \cdot \text{in./rad}$. The wheel is rotated through 90° about the vertical and then released. Knowing that the period of oscillation is observed to be 30 s, determine the centroidal mass moment of inertia and the centroidal radius of gyration of the wheel-and-tire assembly.

SOLUTION

Torsional spring constant: $K = 0.40 \text{ lb} \cdot \text{in/rad} = 33.333 \times 10^{-3} \text{ lb} \cdot \text{ft/rad}$

Let the wheel-and-tire assembly be rotated through the small angle θ. The moment that the wire exerts on the assembly is



$$M = -K\theta$$

$$\Sigma M = \Sigma M_{\text{eff}} = \bar{I}\alpha: \quad -K\theta = \bar{I}\alpha = \bar{I}\ddot{\theta}$$

$$\ddot{\theta} + \frac{K}{\bar{I}}\theta = 0$$

$$\omega_n^2 = \frac{K}{\bar{I}} \qquad (1)$$

Frequency: $f = \dfrac{1}{\tau} = \dfrac{1}{30 \text{ s}} = 0.033333 \text{ H}_z$

$$\omega_n = 2\pi f = (2\pi)(0.033333) = 0.20944 \text{ rad/s}$$

From Eq. (1), $\bar{I} = \dfrac{K}{\omega_n^2} = \dfrac{33.333 \times 10^{-3} \text{ lb} \cdot \text{ft/rad}}{(0.20944 \text{ rad/s})^2}$

Centroidal mass moment of inertia: $\bar{I} = 0.75990 \text{ lb} \cdot \text{s}^2 \cdot \text{ft}$ $\qquad \bar{I} = 0.760 \text{ lb} \cdot \text{s}^2 \cdot \text{ft}$ ◀

Mass: $m = \dfrac{W}{g} = \dfrac{47 \text{ lb}}{32.2 \text{ ft/s}^2} = 1.4596 \text{ lb} \cdot \text{s}^2/\text{ft}$

Centroidal radius of gyration: $\bar{k}^2 = \dfrac{\bar{I}}{m} = \dfrac{0.75990 \text{ lb} \cdot \text{s}^2 \cdot \text{ft}}{1.4596 \text{ lb} \cdot \text{s}^2/\text{ft}} = 0.52061 \text{ ft}^2$

$\bar{k} = 0.7215 \text{ ft}$ $\qquad \bar{k} = 8.66 \text{ in.}$ ◀

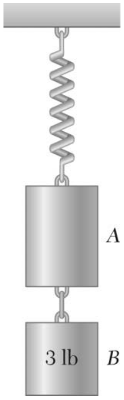
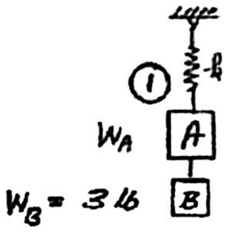
PROBLEM 19.160



The period of vibration of the system shown is observed to be 0.6 s. After cylinder *B* has been removed, the period is observed to be 0.5 s. Determine (*a*) the weight of cylinder *A*, (*b*) the constant of the spring.

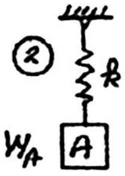
SOLUTION



$$m_1 = \frac{W_A + 3}{g} \qquad \tau_1 = 0.6 \text{ s}$$

$$\tau_1 = \frac{2\pi}{\omega_1} \qquad \omega_1 = \frac{2\pi}{\tau_1} = \frac{2\pi}{0.6} = 3.333\pi \text{ rad/s}$$

$$\omega_1^2 = \frac{k}{m_1} \qquad k = m_1\omega_1^2 = \left(\frac{W_A + 3}{g}\right)(3.333\pi)^2 \qquad (1)$$



$$m_2 = \frac{W_A}{g} \qquad \tau_2 = 0.5 \text{ s}$$

$$\tau_2 = \frac{2\pi}{\omega_2} \qquad \omega_2 = \frac{2\pi}{\tau_2} = \frac{2\pi}{0.5} = 4\pi \text{ rad/s}$$

$$\omega_2^2 = \frac{k}{m_2} \qquad k = m_2\omega_2^2 = \frac{W_A}{g}(4\pi)^2 \qquad (2)$$

(*a*) Equating the expressions found for *k* in Eqs. (1) and (2):

$$\frac{W_A + 3}{g}(3.333\pi)^2 = \frac{W_A}{g}(4\pi)^2$$

$$(11.111)(W_A + 3) = 16W_A$$

$$4.889W_A = 33.333$$

$$W_A = 6.818 \text{ lb}$$

$W_A = 6.82$ lb ◀

(*b*) Eq. (1):

$$k = \frac{6.818 \text{ lb} + 3 \text{ lb}}{32.2 \text{ ft/s}^2}(3.333\pi \text{ rad/s})^2$$

$$k = 33.44 \text{ lb/ft}$$

$k = 33.4$ lb/ft ◀

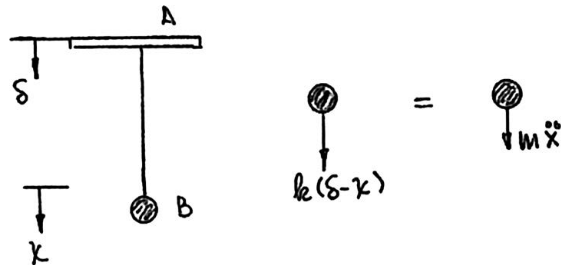
PROBLEM 19.163

An 0.8-lb ball is connected to a paddle by means of an elastic cord *AB* of constant $k = 5$ lb/ft. Knowing that the paddle is moved vertically according to the relation $\delta = \delta_m \sin \omega_f t$, where $\delta_m = 8$ in., determine the maximum allowable circular frequency ω_f if the cord is not to become slack.

SOLUTION



$$\Sigma F = ma \qquad k(\delta - x) = m\ddot{x} \qquad \ddot{x} + \left(\frac{k}{m}\right)x = \delta$$

From Equation (19.31 and 19.33′):
$$x_m = \frac{\delta_m}{\left(1 - \frac{\omega_f^2}{\omega_n^2}\right)}$$

Data:
$$m = \frac{W}{g} = \frac{0.8}{32.2} = 0.024845 \text{ lb}\cdot\text{s}^2/\text{ft}$$

$$k = 5 \text{ lb/ft} \qquad \delta_m = 8 \text{ in.} = 0.66667 \text{ ft}$$

$$\omega_n = \sqrt{\frac{k}{m}} = \sqrt{\frac{5}{0.024845}} = 14.186 \text{ rad/s}$$

The cord becomes slack if $x_m - \delta_m$ exceeds δ_{st}, where

$$\delta_{st} = \frac{W}{k} = \frac{0.8 \text{ lb}}{5 \text{ lb/ft}} = 0.16 \text{ ft}$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. PROBLEM 19.164

The block shown is depressed 1.2 in. from its equilibrium position and released. Knowing that after 10 cycles the maximum displacement of the block is 0.5 in., determine (*a*) the damping factor *c/c*, (*b*) the value of the coefficient of viscous damping. (*Hint:* See Problems 19.129 and 19.130.)

SOLUTION

From Problems 19.130 and 19.129:

$$\left(\frac{1}{k}\right)\ln\left(\frac{x_n}{x_{n+k}}\right) = \frac{2\pi \frac{c}{c_c}}{\sqrt{1-\left(\frac{c}{c_c}\right)^2}}$$

where k = number of cycles = 10

(*a*) First maximum is $x_1 = 1.2$ in.

Thus, $n = 1$ $\quad \dfrac{x_1}{x_{1+10}} = \dfrac{1.2}{0.5} = 2.4$

$$\frac{1}{10}\ln 2.4 = 0.08755$$

$$= \frac{2\pi \frac{c}{c_c}}{\sqrt{1-\left(\frac{c}{c_c}\right)^2}}$$

Damping factor. $\quad 1-\left(\dfrac{c}{c_c}\right)^2 = \left(\dfrac{2\pi}{0.08755}\right)^2\left(\dfrac{c}{c_c}\right)^2$

$$\left(\frac{c}{c_c}\right)^2\left[\left(\frac{2\pi}{0.08755}\right)^2 + 1\right] = 1$$

$$\left(\frac{c}{c_c}\right)^2 = \frac{1}{(5150+1)}$$

$$= 0.0001941$$

$$\frac{c}{c_c} = 0.01393 \blacktriangleleft$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. If you are a student using this Manual, you are using it without permission.*

PROBLEM 19.164 (Continued)

(*b*) Critical damping coefficient. $c_c = 2\,m\sqrt{\dfrac{k}{m}}$ (Eq. 19.41)

or $c_c = 2\sqrt{km}$

$$c_c = 2\sqrt{(8\text{ lb/ft})\left(\frac{9\text{ lb}}{32.2\text{ ft/s}^2}\right)}$$

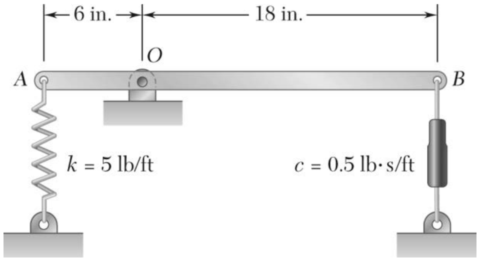
$$c_c = 2.991\text{ lb}\cdot\text{s/ft}$$

From Part (*a*), $\dfrac{c}{c_c} = 0.01393$

$$c = (0.01393)(2.991)$$

Coefficient of viscous damping. $c = 0.0417\text{ lb}\cdot\text{s/ft}$ ◀

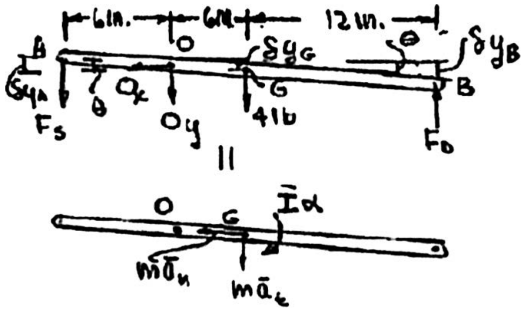
PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*



PROBLEM 19.165

A 4-lb uniform rod is supported by a pin at O and a spring at A, and is connected to a dashpot at B. Determine (a) the differential equation of motion for small oscillations, (b) the angle that the rod will form with the horizontal 5 s after end B has been pushed 0.9 in. down and released.

SOLUTION



Small angles: $\sin\theta \approx \theta, \quad \cos\theta \approx 1$

$$\delta y_A = \left(\frac{6}{12}\text{ ft}\right)\theta = \frac{\theta}{2}$$

$$\delta y_C = \left(\frac{6}{12}\text{ ft}\right)\theta = \frac{\theta}{2}$$

$$\delta y_B = \left(\frac{18}{12}\text{ ft}\right)\theta = \frac{3\theta}{2}$$

(a) Newton's Law: $\Sigma M_0 = (\Sigma M_0)_{\text{eff}}$

$$\curvearrowleft + \; -\left(\frac{6}{12}\text{ ft}\right)F_s + \left(\frac{6}{12}\text{ft}\right)(4) - \left(\frac{18}{12}\text{ ft}\right)F_D$$

$$= \bar{I}\alpha + \left(\frac{6}{12}\text{ ft}\right)m\bar{a}_t \qquad (1)$$

$$F_s = k(\delta y_A + (\delta_{\text{st}})_A) = k\left(\frac{\theta}{2} + (\delta_{\text{st}})_A\right)$$

$$F_D = c\delta \dot{y}_B = c\frac{3}{2}\dot{\theta}$$

$$\bar{I} = \frac{1}{12}ml^2 = \frac{1}{12}m\left(\frac{24}{12}\text{ft}\right)^2 = \frac{1}{3}m$$

Kinematics: $\alpha = \ddot{\theta}, \quad \bar{a}_t = \left(\frac{6}{12}\text{ft}\right)\alpha = \frac{\ddot{\theta}}{2}$

Thus, from Eq. (1),

$$\left[\frac{m}{3} + \frac{m}{4}\right]\ddot{\theta} + \left(\frac{3}{2}\right)^2 c\dot{\theta} + \left(\frac{k}{2}\right)\left(\frac{\theta}{2} + (\delta_{\text{st}})_A\right) - 2 = 0 \qquad (2)$$

But in equilibrium, $\Sigma M_0 = 0$

$$\curvearrowleft + \; k(\delta_{\text{st}})_A\left(\frac{6}{12}\right) - (4)\left(\frac{6}{12}\right) = 0, \quad \frac{k}{2}(\delta_{\text{st}})_A = 2$$

PROPRIETARY MATERIAL. © 2013 The McGraw-Hill Companies, Inc. All rights reserved. *No part of this Manual may be displayed, reproduced or distributed in any form or by any means, without the prior written permission of the publisher, or used beyond the limited distribution to teachers and educators permitted by McGraw-Hill for their individual course preparation. If you are a student using this Manual, you are using it without permission.*

PROBLEM 19.165 (Continued)

Equation (2) becomes

$$\left(\frac{7}{12}\right)m\ddot{\theta}+\left(\frac{9}{4}\right)\left(\ddot{\theta}+\frac{k}{4}\right)\theta=0$$

$$\frac{7}{12}m=\left(\frac{7}{12}\right)\left(\frac{4}{32.2}\right)=0.07246$$

$$\frac{9}{4}c=\left(\frac{9}{4}\right)(0.15)=0.3375$$

$$\frac{k}{4}=\frac{5}{4}=1.25$$

$$0.07246\ddot{\theta}+0.3375\dot{\theta}+1.25\theta=0 \blacktriangleleft$$

(*b*) Substituting $e^{\lambda t}$ into the above differential equation,

$$0.07246\lambda^2+0.3375\lambda+1.25=0$$

$$\lambda=\frac{(-0.3375\mp\sqrt{(0.3375)^2-4(.07246)(1.25)})}{(2)(0.07246)}$$

$$\lambda=\frac{(-0.3375\mp\sqrt{(-0.2484})}{(2)(0.07246)}$$

$$\lambda=-2.329\pm 3.439i$$

Since the roots are complex and conjugate (light damping), the solution to the differential equation is (Eq. 19.46):

$$\theta=\theta_0 e^{-2.329t}\sin(3.939t+\phi) \tag{3}$$

Initial conditions. $(\delta y_B)(0)=0.9$ in.

$$\theta(0)=\frac{(\delta y_B)}{18\text{ in.}}=\frac{0.9}{18}$$

$$\theta(0)=0.05 \text{ rad}$$

$$\dot{\theta}(0)=0$$

From Eq. (3):

$$\theta(0)=0.05=\theta_0\sin\phi$$

$$\dot{\theta}(0)=0=-2.329\theta_0\sin\phi+3.439\theta_0\cos\phi$$

$$\tan\phi=\frac{3.439}{2.329}$$

$$\phi=0.9755 \text{ rad}$$

$$\theta_0=\frac{0.05}{\sin(0.9755)}=0.06039 \text{ rad}$$

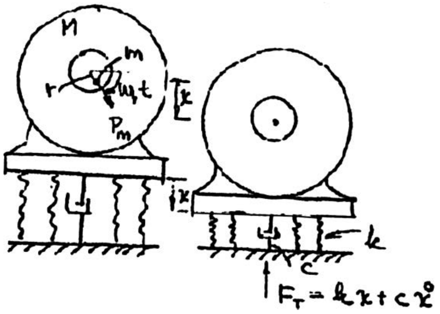
PROBLEM 19.166

A 400-kg motor supported by four springs, each of constant 150 kN/m, and a dashpot of constant $c = 6500\ \text{N}\cdot\text{s/m}$ is constrained to move vertically. Knowing that the unbalance of the rotor is equivalent to a 23-g mass located at a distance of 100 mm from the axis of rotation, determine for a speed of 800 rpm (*a*) the amplitude of the fluctuating force transmitted to the foundation, (*b*) the amplitude of the vertical motion of the motor.

SOLUTION



Total mass: $M = 400\ \text{kg}$

Unbalance: $m = 23\ \text{g} = 0.023\ \text{kg}$

$r = 100\ \text{mm} = 0.100\ \text{m}$

Forcing frequency: $\omega_f = 800\ \text{rpm}$

$= 83.776\ \text{rad/s}$

Spring constant: $(4)(150\times10^3\ \text{N/m}) = 600\times10^3\ \text{N/m}$

Natural frequency: $\omega_n = \sqrt{\dfrac{k}{m}} = \sqrt{\dfrac{600\times10^3}{400}}$

$= 38.730\ \text{rad/s}$

Frequency ratio: $\dfrac{\omega_f}{\omega_n} = 2.1631$

Viscous damping coefficient: $c = 6500\ \text{N}\cdot\text{s/m}$

Critical damping coefficient: $c_c = 2\sqrt{kM} = 2\sqrt{(600\times10^3)(400)}$

$= 30{,}984\ \text{N}\cdot\text{s/m}$

Damping factor: $\dfrac{c}{c_c} = 0.20978$

Unbalance force: $P_m = mr\omega_f^2 = (0.023)(0.100)(83.776)^2$

$= 16.1424\ \text{N}$

Static deflection: $\delta_{\text{st}} = \dfrac{P_m}{k} = \dfrac{16.1424}{600\times10^3}$

$= 26.904\times10^{-6}\ \text{m}$

PROBLEM 19.166 (Continued)

Amplitude of vibration. Use Eq. (19.53).

$$x_m = \frac{\frac{P_m}{k}}{\sqrt{1\left[1-\left(\frac{\omega_f}{\omega_n}\right)^2\right]^2 + \left[2\left(\frac{c}{c_c}\right)\left(\frac{\omega_f}{\omega_n}\right)\right]^2}}$$

Where $$1-\left(\frac{\omega_f}{\omega_n}\right)^2 = 1-(2.1631)^2 = -3.679$$

and $$2\left(\frac{c}{c_c}\right)\left(\frac{\omega_f}{\omega_n}\right) = (2)(0.20978)(2.1631) = 0.90755$$

$$x_m = \frac{26.904\times10^{-6}}{\sqrt{(-3.679)^2+(0.90755)^2}}$$

$$= 7.1000\times10^{-6}\text{ m}$$

Resulting motion: $$x = x_m \sin(\omega_f t - \varphi)$$

$$\dot{x} = \omega_f x_m \cos(\omega_f t - \varphi)$$

Spring force: $$F_s = kx = kx_m \sin(\omega_f t - \varphi) = 4.26\sin(\omega_f t - \varphi)$$

Damping force: $$F_d = c\dot{x} = c\omega_f x_m \cos(\omega_f t - \varphi) = 3.8663\cos(\omega_f t - \varphi)$$

Let $$F_s = F_m \cos\psi \sin(\omega_f t - \varphi) \quad \text{and} \quad F_d = F_m \sin\psi \cos(\omega_f t - \varphi)$$

Total force: $$F = F_m \cos\psi \sin(\omega_f t - \varphi) + F_m \sin\psi \cos(\omega_f t - \varphi)$$

$$= F_m \sin(\omega_f t - \varphi + \psi)$$

(*a*) Force amplitude. $$F_m = \sqrt{(F_m \cos\psi)^2 + (F_m \sin\psi)^2}$$

$$F_m = \sqrt{(kx_m)^2 + (c\omega_f x_m)^2}$$

$$= \sqrt{(4.26)^2 + (3.8663)^2}$$

$F_m = 5.75$ N ◀

(*b*) Amplitude of vibration. $x_m = 0.00710$ mm ◀

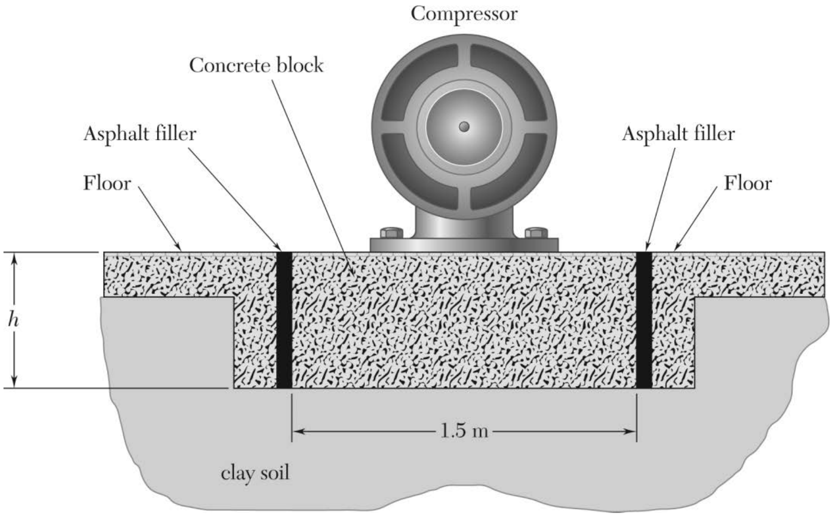
PROBLEM 19.167

The compressor shown has a mass of 250 kg and operates at 2000 rpm. At this operating condition the force transmitted to the ground is excessively high and is found to be $mr\omega_f^2$ where mr is the unbalance and ω_f is the forcing frequency. To fix this problem, it is proposed to isolate the compressor by mounting it on a square concrete block separated from the rest of the floor as shown. The density of concrete is 2400 kg/m^3 and the spring constant for the soil is found to be 80×10^6 N/m. The geometry of the compressor leads to choosing a block that is 1.5 m by 1.5 m. Determine the depth h that will reduce the force transmitted to the ground by 75%.



SOLUTION

Forced circular frequency corresponding to 2000 rpm.

$$\omega_f = \frac{(2\pi)(2000)}{60} = 209.44 \text{ rad/s}$$

In the first case the natural frequency is very large so that the transmitted force is $mr\omega_f^2$.

After the problem is fixed, the transmitted force is

$$P = kx_m = \frac{P_m}{\left|1-\left(\frac{\omega_f}{\omega_n}\right)^2\right|}$$

Since the motion is out-of-phase,

$$P = \frac{P_m}{\left(\frac{\omega_f}{\omega_n}\right)^2 - 1} = \frac{mr\omega_f^2}{\left(\frac{\omega_f}{\omega_n}\right)^2 - 1} \quad (1)$$

But $$P = (1-0.75)mr\omega_f^2 = 0.25\, mr\omega_f^2 \quad (2)$$

If you are a student using this Manual, you are using it without permission.*

Equating expressions (1) and (2) dividing by $mr\omega_f^2$,

$$\frac{1}{\left(\frac{\omega_f}{\omega_n}\right)^2 - 1} = 0.25$$

$$\left(\frac{\omega_f}{\omega_n}\right)^2 - 1 = 4$$

$$\frac{\omega_f}{\omega_n} = \sqrt{5}$$

$$\omega_n = \frac{1}{\sqrt{5}}\omega_f = \frac{1}{\sqrt{5}}(209.44) = 93.664 \text{ rad/s}$$

$$\sqrt{\frac{k}{m}} = \omega_n$$

$$m = \frac{k}{\omega_n^2} = \frac{80\times 10^6 \text{ N/m}}{(93.664 \text{ rad/s})^2} = 9119 \text{ kg}$$

Required properties of the attached concrete block.

Mass: $m - 250 \text{ kg} = 8869 \text{ kg}$

$$\text{volume} = \frac{\text{mass}}{\text{density}} = \frac{8869 \text{ kg}}{2400 \text{ kg/m}^3} = 3.6954 \text{ m}^3$$

$$\text{area} = 1.5 \text{ m} \times 1.5 \text{ m} = 2.25 \text{ m}^2$$

$$\text{depth} = \frac{\text{volume}}{\text{area}} = \frac{3.6954 \text{ m}^3}{2.25 \text{ m}^2}$$

$h = 1.642$ m ◀

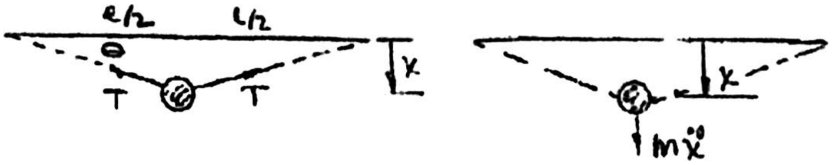
PROBLEM 19.168

A small ball of mass m attached at the midpoint of a tightly stretched elastic cord of length l can slide on a horizontal plane. The ball is given a small displacement in a direction perpendicular to the cord and released. Assuming the tension T in the cord to remain constant, (*a*) write the differential equation of motion of the ball, (*b*) determine the period of vibration.

SOLUTION

(*a*) Differential equation of motion.



$$+\uparrow \; \Sigma F = ma: \quad 2T\sin\theta = -m\ddot{x}$$

For small x, $\sin\theta \approx \tan\theta = \dfrac{x}{\left(\frac{l}{2}\right)} = \dfrac{2x}{l}$

$$m\ddot{x} + (2T)\left(\frac{2x}{l}\right) = 0 \quad ◀$$

$$m\ddot{x} + \left(\frac{4T}{l}\right)x = 0$$

Natural circular frequency. $\omega_n^2 = \dfrac{4T}{ml}$

$$\omega_n = 2\sqrt{\frac{T}{ml}}$$

(*b*) Period of vibration. $\tau_n = \dfrac{2\pi}{\omega_n}$

$$\tau_n = \pi\sqrt{\frac{ml}{T}} \quad ◀$$

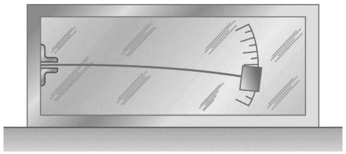
PROBLEM 19.169



A certain vibrometer used to measure vibration amplitudes consists essentially of a box containing a slender rod to which a mass *m* is attached; the natural frequency of the mass-rod system is known to be 5 Hz. When the box is rigidly attached to the casing of a motor rotating at 600 rpm, the mass is observed to vibrate with an amplitude of 0.06 m. relative to the box. Determine the amplitude of the vertical motion of the motor.

SOLUTION

Natural frequency:

$$f_n = 5 \text{ Hz}$$

$$\omega_n = 2\pi f_n = 31.416 \text{ rad/s}$$

Forcing frequency:

$$f_f = 600 \text{ rpm} = 10 \text{ Hz}$$

$$\omega_f = 2\pi f_f = 62.832 \text{ rad/s}$$

Ratio:

$$\frac{\omega_f}{\omega_n} = 2.000$$

$$x_m = \frac{\delta_m}{1-\left(\frac{\omega_f}{\omega_n}\right)^2} = \frac{\delta_m}{1-(2)^2} = \frac{\delta_m}{-3}$$

$$x_m = -\frac{1}{3}\delta_m$$

Relative motion:

$$y_m = x_m - \delta_m = \frac{4}{3}x_m$$

The observed relative motion is

$$y_m = 0.06 \text{ in.}$$

$$x_m = \frac{3}{4}y_m = \frac{3}{4}(0.06 \text{ in.}) \qquad x_m = 0.045 \text{ in.} \blacktriangleleft$$

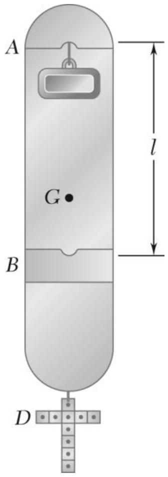
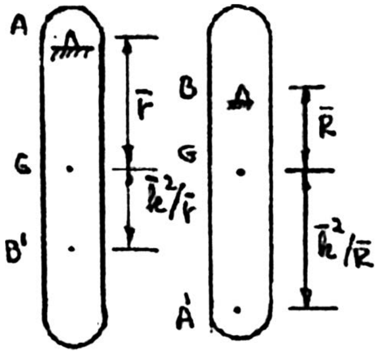
PROBLEM 19.170



If either a simple or a compound pendulum is used to determine experimentally the acceleration of gravity g, difficulties are encountered. In the case of the simple pendulum, the string is not truly weightless, while in the case of the compound pendulum, the exact location of the mass center is difficult to establish. In the case of a compound pendulum, the difficulty can be eliminated by using a reversible, or Kater, pendulum. Two knife edges A and B are placed so that they are obviously not at the same distance from the mass center G, and the distance l is measured with great precision. The position of a counterweight D is then adjusted so that the period of oscillation τ is the same when either knife edge is used. Show that the period τ obtained is equal to that of a true simple pendulum of length l and that $g = 4\pi^2 l/\tau^2$.

SOLUTION

From Problem 19.52, the length of an equivalent simple pendulum is:



$$l_A = \bar{r} + \frac{\bar{k}^2}{\bar{r}}$$

and
$$l_B = \bar{R} + \frac{\bar{k}^2}{\bar{R}}$$

But
$$\tau_A = \tau_B$$

$$2\pi\sqrt{\frac{l_A}{g}} = 2\pi\sqrt{\frac{l_B}{g}}$$

Thus,
$$l_A = l_B$$

For
$$l_A = l_B$$

$$\bar{r} + \frac{\bar{k}^2}{\bar{r}} = \bar{R} + \frac{\bar{k}^2}{\bar{R}}$$

$$\bar{r}^2\bar{R} + \bar{k}^2\bar{R} = \bar{r}\,\bar{R}^2 + \bar{k}^2\bar{r}$$

$$\bar{r}\bar{R}[\bar{r} - \bar{R}] = \bar{k}^2[\bar{r} - \bar{R}]$$

$$(\bar{r} - \bar{R}) \neq 0$$

Thus,
$$\bar{r}\bar{R} = \bar{k}^2$$

or
$$\bar{r} = \frac{\bar{k}^2}{\bar{R}}$$

$$\bar{R} = \frac{\bar{k}^2}{\bar{r}}$$

PROBLEM 19.170 (Continued)

Thus, $AG = GA'$ and $BG = GB'$

That is, $A = A'$ and $B = B'$

Noting that $l_A = l_B = l$

$$\tau = 2\pi\sqrt{\frac{l}{g}}$$

or

$$g = \frac{4\pi^2 l}{\tau^2}$$
